Figure (2). Detection of biofilm producers of otitis media bacterial pathogens by Tissue Culture Plate method with crystal violet staining.

In this study, the unique ability of *P. aeuginosa* to form biofim makes it as the main cause of OM infections in Iraqi children, where, Chronic suppurative otitis media is largely due to biofilm-forming bacteria, of which a common pathogen is *Pseudomonas aeruginosa*, and this species develop into biofilms and form chronic infections in the middle ear of a mouse model of Eustachian tube obstruction and acute tympanic membrane wounds[23].

The weak biofilm formation of *P. mirabilis* and *K. pneumoniae* in OM infection may be due to that these bacteria related to bacterial colonization of catheter devices infections such as urinary tract infections [24]. It finds that the mucosal biofilm has been implicated in several pediatric respiratory infections, including otitis media with effusion, tonsillitis, adenoiditis, persistent endobronchial infections, chronic rhinosinusitis, and bronchiectasis[25]. The nasopharyngeal biofilms have the main role in the effectiveness of antibiotic in children with otitis media, because the biofilm play a role in the development of chronic nasopharyngeal inflammation, which is may be associated with chronic

or recurrent middle ear disease[26]. The bacterial biofilms of clinically *H. influenzae* in patients with acute otitis media infections are responsible for the development of acute middle ear infections on the basis of the detection of biofilms produced by this species[27]. The production of biofilm may explain the failure of traditional antibiotic treatment acute otitis media, which act as favourable environment[28]. Biofilm formation is considered as a survival strategy by bacteria to antibiotics which are effective against bacteria. Biofilms are almost impossible to grow in the laboratory media and are incredibly resistant to antimicrobials, which mean that the diagnosis of chronic OM is one of the most challenging in the management of middle-ear infection[29]. The previous results gave a role of biofilm formation in the entire cavity of the middle ear of children with recurrent AOM, contributing to the viscosity of effusion[30].

Conclusion

The current study revealed that the strong biofilm was the most prevalent in *P. aeruginosa* followed by *S. aureus* and the biofilm formation leads to difficulty in treatment of OM, mainly due to its frequent association with multidrug resistant bacteria, also, it was obvious that the Combinations ceftazidime-amikacin and ceftazidime-ciprofloxacin displayed synergistic activity against the most of tested isolates.

The Role of Religion and Spirituality in Alcohol Use Treatment and Recovery: An Integrative Review

Mohannad A. Aldiqs[1], Ayman M. Hamdan-Mansour[2]

[1]Lecturer, Mental Health Nursing, Faculty of Nursing, Al-Ahliyya Amman University, Amman- Jordan 19328, [2]Professor, Mental Health Nursing, School of Nursing, The University of Jordan Queen Rania Street, Amman 11942 Jordan

Abstract

Despite the belief that religion and spirituality considered the most important cultural factors that give meaning to human behaviors and values, religion and spirituality have been equally ignored in the empirical alcohol studies. The purpose of this integrative review paper is to identify the role of religion and spirituality in alcohol use treatment and recovery. An integrative review has been utilized to address the issue. There is a presentation of findings from research examining religion and spirituality and their relationship to alcoholism. Treatment requires awareness of underlying causes to establish effective treatment approaches. Determining these underlying causes requires adequate knowledge of underlying personal beliefs and values that adheres to religions and spirituality. Health professionals across disciplines have an important role in implementing multidisciplinary interventions. Results, controversies, and concerns raised by the reported results are addressed. Implications for future research are delineated.

Keywords: *Alcoholism; Belief System; Religion; Spirituality.*

Introduction

The past few decades witnessed a growing public interest in alcoholism and related method of treatment. Alcohol is a widely used substance throughout all ages, cultural, and ethnic groups[1]. It affects individuals, families, and societies' financial, psychological, and social functions[2]. This evokes attention towards understanding the socio-cultural factors that contribute to alcohol use and its related treatment approaches. Amongst, is religion and spirituality that forms a significant component of any given culture.

Despite the belief that religion and spirituality considered the most important cultural factors that give meaning to human behaviors and values[3], religion and spirituality have been equally ignored in the empirical alcohol studies[4]. The researchers mostly include all questions related to religion and spirituality combined as one factor[5]. The use of alcohol and other drugs is clearly proscribed in some cultural and religious groups and commended in others. Larson and Larson[5] maintained in their review that researchers tend to assess religious affiliation as a measure to religion. This kind of neglect of religion and spirituality was also observed in medical studies. Mueller and his colleagues[6] related that to the researchers' tendencies to use the biomedical model in which physical evidence is paramount. Addressing religion and spirituality as one factor is a questionable issue giving that in many cultures, religion and spirituality are not indicating the same meaning although some common components may exist. The connection between religion, spirituality, and alcohol use required further investigation as alcohol treatment programs depend largely on psychosocial modalities that use the individuals cultural, religious, and spiritual background as major components. Furthermore, mental and medical practitioners are aware of the legal aspects of substance use and treatment; however, recognizing religion and spirituality as core components allows adopting effective approaches to treatment. The *purpose* of this integrative review is to identify the role of religion and spirituality in alcohol use treatment and recovery. The discussion will include a review of studies and treatment approaches that support the efficiency of using the spiritual and religious dimensions in alcohol recovery. Besides, the interrelationship among alcoholism, religion, and

spirituality is also discussed. The paper will emphasize the role of religion and spirituality as an essential and commended approach to deal with the alcohol problem at the individual and society level.

Method

Data Source: The article search was conducted by the first author. EB identified articles by scanning and reviewing all existing literature reviews of Religion, Spirituality, and Alcoholism. Reference lists of these articles were further reviewed for relevant studies. Then literature searches were conducted between January 2010 to Jun 2020 using the online databases: Medline/ Pubmed, PsycINFO, Google Scholar, British Nursing Index, Pro-Quest, Elsevier, EBSCOhost, and Cumulative Index to Nursing and Allied Health Literature (CINAHL) Plus using the following search keywords: Alcoholism; Belief System; Religion and Spirituality. Only peer-reviewed papers published in Arabic and English were considered; no geographical limits were used.

Medical subject headings (MeSH) descriptors or appropriate permutations were used to index the content of the databases. The Boolean operators "AND" and "OR" were used as connectors to combine the various search terms and help narrow down the search. Using "AND" ensures that articles with both search terms are retrieved whereas using "OR" ensures the retrieval of articles with either of the search terms. With the aid of these Boolean operators, the search terms were combined as follows: Alcoholism AND Religion OR Spirituality OR Belief System; Alcoholism AND Belief System OR Religion OR Spirituality; and Alcoholism AND Belief System OR Religion OR Spirituality (Table 1).

Table 1. Boolean table showing keywords used for research.

List of search terms:
Alcoholism AND Spirituality OR Religion
Alcoholism AND Spirituality OR Belief System

Inclusion and Exclusion Criteria: The inclusion criteria included articles published in the English language, research studies specifically related to Religion, Spirituality, Alcoholism, and relevant publications regardless of the study design. The inclusion criteria also included articles published from the year 2010 to 2020 to ensure that only current evidence is explored. The exclusion criteria included studies that were not relevant to Religion, Spirituality, Alcoholism, studies published in languages other than English and Arabic, and studies with publications older than 2010.

Religion and Spirituality: The word religion is taken from the Latin word *religare* which means "to bind together" [7]. Religion reflects a set of beliefs and practices that are agreed upon by specific groups of people. The degree to which an individual devote or the quality of being religious refers to religiosity or religious involvement[7]. Spirituality is taken from the word *spiritualitas* which means "breath"[7]. Spirituality can be defined as "*a broad concept that encompasses values, meaning and purposes; one turn inward to the human traits of honesty, love wisdom, caring, imagination, compassion, existence of quality of a higher authority, guiding spirit or transcendence that is mystical; a lowing, dynamic balance that allows and creates healing of body-mind spirit; and may or may not involve organized religion*" [8] p24. Three characteristics of spirituality as posited by Margaret Burkhardt [9] are unfolding mystery, harmonious inter connectedness, and inner strength. Some researchers use the term spiritual wellbeing to refer to spirituality. But these two terms are different. Spiritual wellbeing refers to "*the affirmation of life in relationship with God, self, community, and environment that nurtures and celebrates wholeness*[10]. Spiritual well-being is first emerged by David O. Moberg in 1971 where he defined it as *"wellness or health of the totality of the inner resources of people, the ultimate concerns around which all other values are focused, the central philosophy of life that guide the conduct, the meaning-giving center of human life which influences all individual and social behavior"*[11], p2). Carson[12] maintained that spiritual wellbeing is not a state but rather an indication of the presence of spiritual health in the person. The features of spirituality include connectedness with others and divine, transcendence (the human is more than simple materials), and values as love and justice[13]. Despite of the growing interest in different professional disciplines to study the impact of spirituality on various aspects of individuals' health, researchers were not able to present a measurable definition of spirituality; Therefore, researchers used to measure religiosity to address spirituality[14]. However, religion and spirituality do not refer to the same things. Canda [15], who has developed a concept of spirituality for social work, maintained that religion involves modeling of the individual's spiritual practices and beliefs into a social institution. Religion is at the level of individual

and has boundaries of specific beliefs, practices, and forms of governance and rituals[16].

The Interrelationship between religion and alcoholism: Most clinical studies and population surveys noted that religiosity and alcohol use are inversely related (e.g.,[17]; [18]). Chang-Lin and his colleagues [19] found that religiously exhibited lower use and initiation of alcohol. In a recent study, the investigators found that religiously-involved students are less likely to abuse alcohol than their nonreligious colleagues[20]. Even in maintaining abstinence, religious individuals show more significant results in terms of longer abstinence periods[21].

A systematic review showed that there is an inverse relationship between attitudes toward alcohol drinking and religiosity[22]. Religion was negatively associated with using alcohol among adolescents sample[23]. These studies show some significant and supportive results toward the effective use of religious beliefs and practices in alcohol sober and abstinence. We need to have these studies replicated in various cultural and religious groups. Despite of the valid results of an existing inverse relationship between alcohol use and religiosity, it very difficult to develop a causal relationship[6].

Spirituality and Alcoholism: The issues of measuring spirituality become one of the main concerns for the workers in the sociocultural and psychosocial disciplines. Therefore, drug and alcohol abuse is considered a symptom of wounded spirituality [24]. This view is not what Royce[25] went for when he called addiction, to alcohol and any other drug, as a spiritual disease. Royce[25] maintained that addiction is simply not functioning with ease regarding the drug. He relied mainly on his understanding of the word disease. He pointed out that "disease" is a "lack of ease"; therefore, alcohol works as a disease by impairing the ability of the body to thinks and feel right about God. The alcoholics and addict resort to drugs and alcohol in an attempt to void and overcome that spiritual emptiness, spirituality is protective factors and function as mechanisms against relapse[26]. Hence, the AA's has a strong belief that addiction, including alcoholism, is a spiritual disease. Researchers[27] presented an interesting idea that relates alcoholism and addiction to spirituality by maintaining that spirituality is the functions of the right hemisphere in which it is the part of the brain that most of the addiction drugs make their effects. Therefore, when the defect in spirituality happiness, such as a feeling of spiritual emptiness, the addicts use alcohol and other drugs for the pharmacological benefits of the drugs in the right hemisphere, where the spiritual process takes place.

Religion, Spirituality and Health: The last few decades witnessed an increased interest in the role of an individual's belief system and spirituality in maintaining and promoting individuals' health. Health practices, in general, and medicine specifically has been historically liked to religion, and religious people were always the resort for individuals' health problems. By time medicine, followed by other health care professions split themselves from religion. In the present time, health professionals are encouraged to consider the spiritual assessment and spiritual care in their process of care of individuals and families [1]. This reflects the importance to deal with the individual as a whole not only from a disease model perspective. Mueller and his colleagues [6] in their review found that patient care was well enhanced by employing and enforcing the patient's spirituality. They indicated that spirituality enhanced patient coping, and quality of life and patients valued their spiritual wellness equal to their physical well-being.

The association between high spirituality and religiosity with physical and psychosocial well-being has been strongly recommended in the literature. Higher levels of spirituality and religion have been found to be negatively associated with rates of alcohol and drug use, suicide, and depression [28]. Spirituality found to associate with an individual's health through reduced loneliness [29]. Further, religious practices are inversely related to the severity of symptoms and hospital use and enhance life satisfaction among psychiatric inpatients [30]. This indicated why many people turned to alternative medicine is because it corresponds with their beliefs, values, and philosophical orientation, and because of dissatisfaction with conventional medicine [31]. However, religion has been reported with some negative consequences on the individual's health behaviors and practices such as obesity [32], obsessive behaviors [33], and adherence to medical regimens [34]. While some of these beliefs may not be accepted by the health care providers and other allied professionals, ethicists suggest that these beliefs must be respected [35].

Therefore, spiritual assessment and exploring religious beliefs have to be part of the patient's holistic management and a core part of the first visit [36]. That includes fears, wishes, values, hopes, and the way they perceived disease and illness ([37]; [38]). The person should

not be seen as an object, rather as a biological, spiritual, physical, and social human being. These considerations should not be limited to patients who attend hospitals and clinics suffering from psychotic-related illness, as found by Hilton and his colleagues [39], but also for all patients. One way to accomplish that is by learning the significance of spiritual assessment outcomes in the process of caring and decisions related to the selection of treatment approaches.

Role of Religion and Spirituality in Alcohol Recovery: The worker and professionals who deal with addiction problems are no more ignoring the role of the spiritual dimension in recovery from alcoholism and addiction. Literature has provided a significant association between alcohol recovery and spiritual awakening (e.g., [40]). Among the dominant treatment initiatives of alcoholism is Alcoholics Anonymous (AA) [41]. In the AA, the individual develops "humanity, inner strength, a sense of meaning and purpose, acceptance, tolerance, and harmony in one's life" ([42], p 209). These entire elements considered to be important components in the individual's spirituality. Therefore, the basic of AA is spiritual growth by practicing certain spiritual principles and traditions [43]. The AA does not provide the definite cure of alcoholism; rather, relieving the alcoholic through practicing the twelve steps and twelve traditions that guide the spiritual growth. Alcoholics Anonymous is not the only alcohol recovery program that is spiritually-related. There are Al-Anon and Alateen, Rational Recovery, SMART Recovery, secular organization for sobriety, men for sobriety, and women for sobriety. All these groups have common agreement on rejecting the disease model of alcoholism, recognize the diversity in treatment, and spirituality is a key element in the recovery [42].

Drinking outcome after treatment is not related to the extent to which the individual attends the AA [44-46]; however, the involvement in AA has been significantly related correlated with drinking outcomes. While studies supported the effect of the spiritual dimension and using meditation on the health outcomes among alcohol and drug addicts (e.g., [47]) the controlled studies revealed a non-significant effect of using meditation on alcohol consumption [48]. One of the major supportive results that related the use of spirituality in alcohol recovery is reported by the project MATCH, where individuals who have AA involvement and spiritual/religious involvement groups have better outcomes on the abstinence measures compared with others in the cognitive/behavioral skills group and motivational enhancement group. Although spiritual/religious involvement may be an important protective factor against alcohol/drug abuse, and Individuals currently suffering from these problems are found to have a low level of religious involvement and spirituality [49-50], the spiritual-focused intervention is still a debated issue and not well-proven due to the limited empirical evidence [16].

Implication and research issues: The reviewed studies on alcoholism and its relationship to religion and spirituality acknowledge the role of religious/ spiritual affiliation as a protective factor against alcohol use and abuse. Although some studies revealed a positive relationship between the religious/spiritual involvement and recovery from alcohol; however, the limited empirical evidence limits the ability to establish a predictive relationship. Nevertheless, the roles of religion and spiritual beliefs have been strongly addressed as one major components for alcohol recovery and sobriety. This is dependent upon personal rather than selected model of treatment. Therefore, mental and addiction health practitioners need to assess and investigate sources of internal power and strengths of individuals with alcohol use problems. legal aspects of alcohol use although considered significant factors, the medical and mental health practitioners need to develop their intervention using the power of personal belief and accommodate their plans to cultural factors. This reflects the importance of including the spiritual dimension as an essential part of the process of caring.

The evidence of religious and spiritual practices in protecting against addiction logically implies that these practices can be used effectively in the process of recovery. This require psychiatric and addiction practitioners to gain more understanding of the spirituality and religious affiliation of individuals with alcohol use problems and disorders. Further, the health care providers are urged to include the outcomes of spiritual assessment planning and interventional processes. The researchers need to investigate more the relationship between alcohol recovery and spiritual/religious involvement and include the spiritual variables in the treatment studies. Recognizing that the main barrier to research is lack of interest of researchers in studying religious and spiritual concepts, there is a need to integrate these concepts while addressing alcohol use recovery and treatment research and interventions. The mental health professionals probably lack the appropriate knowledge to use tools and method of measuring religiously and spiritual

beliefs inferring the need to have the researchers and mental health and addictions specialists to communicate and cooperate to improve the excellence of the produced studies in the field of alcoholism.

There is a need to deal with the individual as a whole system and applying the holistic approach of care including the biological, social, psychological, physical, and spiritual processes. Religion has been linked to medicine and health, why not to regain this relationship, and present it in a scientific way. It's time to build the holistic model of health care that recognizes individuals' spirituality and religious affiliation.

Conclusion

There has been growing interest in studying the relationship between alcoholism and spiritual/religious involvement. Studies have acknowledged the role of an individual's spirituality and religious beliefs in physical and psychosocial well-being and alcohol recovery. This paper presented a discussion of the relationship between spirituality and religiosity and alcoholism. The paper presented a discussion that shows the significant role of spiritual/religious involvement as a protective factor against alcohol use problems and disorder as a supportive element in the process of recovery. Controversial findings related to the nature of this relationship also presented. Further, the paper delineated how individuals' spirituality and religiosity may differ and how can they be linked. Implications and research concerns with suggestions presented and discussed for implementation in the research, education, and clinical settings.

Quality of Life After Bariatric Surgery

Moly K.T.

Professor cum Principal, Amrita College of Nursing, Amrita Institute of Medical Sciences, AMRITA Vishwa Vidyapeetham, Kochi, Kerala, India. PIN: 682041

Abstract

Bariatric surgery improves patients' well-being beyond significant weight loss and resolution of comorbidities, Quality of Life (QoL) is a relevant but challenging variable to assess in the process of weight loss and lifestyle changes. The primary objective of the study was to determine the QoL of patients after bariatric surgery in comparison with obese patients who have not undergone bariatric surgery. A descriptive analytical approach was used to collect data from 100 subjects who had undergone Laparoscopic Sleeve Gastrectomy (LSG) through SF 36 in comparison with 100 obese subjects without surgery. 50% data collection was done directly from OPD and 50% from telephonic contact in both the groups. The mean scores in all the eightdimensions of SF 36 were found to be good in Bariatric Surgery (BS) group. Both Physical Component Score (PCS) and Mental Component Score (MCS) were found to be high, the MCS being higher (85.74 + 22.72) than the PCS (83.68 + 21.8) in BS group whereas the MCS was poor in obese group (49.98 + 11.84). The overall QoL of BS group was found to be good (mean 80.93 + 18.18) compared to obese group (49.69 + 11.77). The health related QoL was found to be quite good in patients after LSG than those without surgery. The study concludes that the health related quality of life is better in obese patients after LSG than those without surgery. The study also strongly recommends the conduct of long term longitudinal qualitative studies with multiple points of measurements and follow-ups to be extended to the community.

Keywords: *Quality of Life, Laparoscopic Sleeve Gastrectomy, Physical Component Score, Mental Component Score, Obesity.*

Introduction

LSG has gained grounds worldwide as the popular bariatric surgical procedure including Asia. Sleeve gastrectomy has been found to improve Quality of Life (QoL) and allows reduction of comorbidities.[1,2,3] Beyond significant weight loss, the objective of bariatric surgery is to improve patients' postoperative well-being. QoL is recognized as a relevant variable to consider in the weight loss process and psychologic monitoring of patients.

It has to be remembered that almost all the patients who had undergone obesity surgery,were not successful in following or maintaining a prescribed diet in the past. Adherence to the dietary restrictions and altered lifestyle necessary after LSG requires continuous monitoring and support from relatives and caregivers.[4]

The importance of optimizing patients' monitoring, notably around 15 to 18 months after bariatric surgery (the first "critical" period of weight regain) especially for men and diminished self-perceived QoL especially for women has been highlighted in literature.[5]

QoL is a multidimensional construct. When applied to obesity, it includes not only health-related and weight-related QoL, but also the psychosocial burden. These relationships stress the necessity of its assessment.[6] But less is known about its psychosocial impact. Depressive disorders are the most common psychological diagnoses (ranging from 4.4% to 53%), followed by anxiety disorder.[7,8] In a study on Quality of Life and Depression

in obese conducted among 220 patients attending various OPDs of a tertiary care hospital, the QoL in mental components (49.43+/-13.68) was found to be poor than the physical component (54.4+/-20.09).[9]

The long term complications after bariatric surgery cannot be neglected. The chronic complications include stricture (3.5%), nutritional deficiencies, Vit. B_{12}, Vit. D, folate, iron & zinc deficiency (3%, 23%, 3%, 3% & 14% respectively) and gastrooesophageal reflex disease [GERD] (47%).[10]

Although there seems to be adequate post surgical physical care following BS there appears to be a lack of postsurgical psychosocial follow up and support for these patients.[11] The psychological distress and the vulnerability in social situations while adjustingto the new rapidly changing body image after LSG needs attention.

Massive weight loss often leaves the patient with large quantities of flabby skin that can result in problems related to altered body image. Additional surgeries may be required to handle the excess skin which may cause confusion about the impact of bariatric surgery.

Most of the studies conducted in India were to compare the effect of different types of bariatric surgical procedures in terms of weight loss and resolution of comorbidities. Studies in India on QoL after LSG were found to be less. Also it is interesting to note that women account for 80% of those having BS, although the reasons are poorly understood.[12]

Successful QoL after bariatric surgery depends on proper selection of patients and a thorough pre operative preparation by a multidisciplinary health care team. The nurses' role in making the patient and family members clear about the real expectations as well as their own responsibilities in the diet and life style on a long term basis is to be understood.

The purpose of the study was to explore the health related QoL in patients after bariatric surgery (Laparoscopic Sleeve Gastrectomy) in comparison with obese patients without surgery so as to provide the right perception of the surgical outcome to the candidates for bariatric surgery as well as the health care team along with an awareness of each one's responsibilities towards attaining the best possible QoL.

The primary objective of the study was to determine the QoL of patients after bariatric surgery in comparison with obese patients who have not undergone bariatric surgery. Accordingly, the null hypothesis tested was**"**There will be no significant difference between the mean Quality of Life score of obese patients after bariatric surgery (BS group) and obese patients who did not undergo bariatric surgery (Obese group/Control group)"

Materials and Method

In view of the nature of problems selected for the study and objectives, a descriptive analytical approach was used. The study sample included 100 subjects who had undergone bariatric surgery six months before and 100 obese subjects without surgery at the same time meeting the selection criteria for bariatric surgery as per ASMBS 2012. As subjects after bariatric surgery rarely need to come to OPD after six months, 50% data collection was done from GI Surgery OPD and 50% from telephonic contact. Data collection from obese patients was also done in the same way ie, 50% from OPDs (Medicine, Endocrinology OPDs and Obesity Clinic) and 50% through telephonic contact. Data collection took around one year. QoL was assessed through RAND SF 36 Item Health Survey 1.0.[13]The item-and scale-level statistical analyses supported the validity and reliability of SF-36 for use in India.[14]

Results

Sample Characteristics: The group of patients after bariatric surgery was referred as 'BS group' and obese patients who have not undergone surgery were referred as 'Obese group' for easy understanding**.** The study subjects in BS group were comparatively of younger age than the obese group. (76% in BS group belonged to the age group 31-55 years whereas in obese group it was only 65%) Majority of the subjects in both the groups were females (BS group – 61% and obese group - 73%). The BS group was more educated than the obese group (58% of subjects in BS groups were graduates or post graduates whereas it was only 28% in obese).

Nearly half of study subjects in BS group (46%) changed to the category of overweight after surgery. However, 4% in BS group were still in class 3 obesity, 14% in class 2 obesity and 36% in class 1 obesity category. The mean weight before surgery 115.99 + 22.97 was reduced to a mean of 84.02 + 17.75 after surgery. The mean percentage of EWL was 63.31 + 26.20. The mean weight of BS group was 84.02 + 17.75 at the time of

study while the mean weight of obese group was 91.71 + 13.68 with a BMI 42.47 + 6.03 obesity Vs 38.72 + 3.48 (F value significant at 0.001).

Quality of Life in patients after bariatric surgery and in obese patients who have not undergone bariatric surgery.

Table 1: Distribution of subjects based on mean QoL in eight dimensions N=200

Dimensions	BS (n=100)				OBESE (n=100)			
	Min.	Max.	Mean	SD	Min.	Max.	Mean	SD
Physical functioning (PF)	15	100	86.95	23.41	0	95	52.5	22.78
Role limitations due to physical health (RPF)	0	100	86.25	33.59	0	100	47.75	24.89
Role limitation due to emotional problems (REF)	0	100	88.67	30.05	0	100	41.33	31.11
Energy fatigue (E)	0	100	83.55	23.6	15	85	52.45	13.64
Emotional well being(EW)	0	100	85	23.41	28	88	53.2	11.96
Social functioning (SF)	0	100	83.88	30.01	13	100	55.5	17.13
Pain(P)	0	100	77.85	28.27	10	100	60.75	24.2
General Health (GH)	20	80	53.9	8.95	0	65	38.2	12.46

Of the eight dimensions of QoL assessed, the mean scores in all the dimensions were found to be good in BS group with the highest score in Role Limitations due to Emotional Problems ie, REF (88.67 + 30.05), followed by Physical Functioning ie, PF and Role Limitations due to Physical Health ie, RPF (86.95 + 23.41, 86.25 + 33.59 respectively) and the lowest in General Health ie, GH (53.90 + 8.95). On the other hand, the dimension GH was found to be very poor in obese group (38.2 + 12.46) followed by REF with a score of 41.33 + 31.11 and RPF 47.75 + 24.89. The other dimensions showed only a slightly above average score.

Table 2: Distribution of subjects based on the physical and mental component mean scores of QoL N=200

Component	BS (n=100)				OBESE(n=100)			
	Min.	Max.	Mean	SD	Min.	Max.	Mean	SD
Physical component score (PCS)	5	100	83.68	21.8	3	84	52.34	18.95
Mental component score (MCS)	0	100	85.74	22.72	25	83	49.98	11.84

Both PCS and MCS were found to be high in BS group. The mental component score was higher (85.74 + 22.72) than the physical component score (83.68 + 21.8) in BS group whereas the mental component score was poor in obese group (49.98 + 11.84) than the physical component score (52.34 + 18.95).

Table 3 Mean and Standard deviation of the overall QoL in BS group and obese group N=200

QoL	Minimum	Maximum	Mean	SD
QoL BS group	22	94	80.93	18.18
QoL Obese group	15	77	49.69	11.77

The overall quality of life of BS group was found to be good (mean 80.93 + 18.18) whereas it was poor in obese group (49.69 + 11.77).

Table 4: Distribution of the subjects based on their present general health compared to Oneyear ago. N = 200

	BS group (n=100)		Obese group (n=100)	
	f	%	f	%
Much better	62	62	6	6
Somewhat better	15	15	25	25
Same	8	8	25	25
Somewhat worse	8	8	42	42
Much worse	7	7	2	2

Majority (62%) in the BS group perceived their present general health much better compared to one year ago while only 6% of the obese group perceived it so. The rest 42% in the obese group perceived their general health as somewhat worse than one year ago and for 25%, it was status quo.

Since the p-value obtained by the K-S test was less than 0.05 significance level in all the dimensions or components, the two groups were considered as heterogeneous. Hence Mann - Whitney U test was used to compare the mean scores of both the groups. It showed a highly significant statistical difference between the BS group and obese group in their Mean QoL (over all, dimension wise and component wise). Hence the null hypothesis was rejected.

Of the six socio-demographic variables (age, gender, marital status, education, occupation and type of work), statistically significant association was found between age, education, occupation and QoL (p value < 0.05). A highly significant statistical association was found between duration after surgery and QoL in the BS group. 86% of the subjects studied were between 6 months to 5 years after LSG. Of, these 94.18% had good QoL. However, QoL was good only in nine out of fourteen subjects who had undergone bariatric surgery five years before.

Discussion

LSG is the recent bariatric surgery performed to reduce excess weight and improve QoL in morbidly obese. Though studies have shown that QoL can improve as soon as three months after bariatric surgery, the present study included only subjects who underwent LSG from six months to six years under the assumption that patients may have surgery related discomforts that may interfere in their QoL within six months.[15]

The mean scores of QoL (dimension wise,physical and mental componentsand overall) were found to be good in BS group than the obese group. Similar findings were observed in studies conducted mostly abroad. Substantial and significant improvement in physical and mental health favouring the surgical group was observed in a systematic review and meta-analysis on long term HRQL in bariatric surgery patients compared with controls spanning 5 to 25 years after surgery.[16] Sleeve gastrectomy has been found to improve QoL and allows reduction of comorbidities.[17,18]

Studies by Akan et al., Fezzi et al., Porta et al. and Rebibo et al. demonstrated significant improvement in all domains of the SF-36 in 6 and 12 months after surgery compared to preoperative scores.[19,20,21,22] Two studies in Indian settings also showed similar improvements in QoL one being in kerala.[23,24]

Long term studies like the famous Swedish Obese Subjects (SOS) intervention study, Norway(2014) systematic database search for a period of 10 years found significantly better outcome in the surgical group. But the peak improvements in HRQL after bariatric surgery was during the first year, whereas the weight regain phase (mainly between 1 and 6 year follow-up) was accompanied by a gradual decline in HRQL.[25,26]

Some studies could prove significant improvement only in selected dimensions of QoL.An Italian study (2014) to evaluate the changes of HRQL after bariatric surgery in 110 patients using SF- 36 showed a significant improvement in all dimensions of SF- 36 except General health and Mental health.[27]In Poland the SF 36 scores were statistically different in all parameters ($P < 0.05$) except for “role limitations attributed to emotional problems” and “mental health” in a group of 120 patients in comparison with patients scheduled for surgery.[28]A

systematic review with 72 studies on 9433 patients found that bariatric surgery has a significant positive influence on QoL in general with a greater positive influence on physical QoL compared to mental QoL.,[29,30,31,32,33]

These findings are different from the present study findings in that the QoL had significantly improved in mental dimensions than the physical dimensions. The difference may be due to the improvement in self esteem, societal and family acceptance felt by the subjects probably influenced by the age, education and culture.

Contradictory to the findings of the present study, the physical and mental component scores were significantly found to be lower than the norm population mean in a Midwestern academic medical center study on 350 patients after bariatric surgery (2015). The study concluded that improvements in HRQL following bariatric surgery do not appear to be sustained over long term.[34]

Recent literature has raised concerns regarding the risk of adverse psychiatric events among bariatric surgery patients. The improvement in MCS score found in the present study is contrary to a recent study by Szmulewicz A, et al. 2019 who did a systematic review and meta-analysis of RCTs that compared surgical and non-surgical treatments and assessed mental health QoL of bariatric surgery patients. Eleven randomized trials with 731 participants were included in the finalanalysis. The final mentalhealth QoL scores were similar for surgically and non-surgically treated patients (SMD: 0.37, 95% CI -0.07 to 0.81). These results suggest that intensive mental health follow-up following surgery should be routinely considered.[35]

In general it can be stated that most of the studies showed improvement in HRQL after LSG in 6-80 months follow-up in adult population. The impact varied considerably across studies showing a significantly greater positive influence on physical QoL compared to mental QoL.

Clinical Application: The compliance of the bariatric surgery subjects to the new lifestyle and changes during weight loss/weight regain periods could be enhanced only by consistent follow up by the community health workers resulting in better QoL. The fluctuations in weight loss after crossing certain threshold needs further longitudinal studies with multiple check points.[36] Listening to the psychosocial issues of these patients would help in detecting early the manifestations of psychological disorders like depression so that appropriate referral services could be offered. Finally aggressive, comprehensive measures should be taken by the regional, state and national level governments to prevent obesity from childhood as patients after bariatric surgery have to live with restrictions hour as India ranks third in obesity in the world.

Conclusion

The study concludes that the health related quality of life is better in obese patients after LSG than those without surgery in the study subjects. Hence the null hypothesis is rejected. The study also strongly recommends the conduct of long term longitudinal qualitative studies with multiple points of measurements and follow-ups to be extended to the community.

Socio-Legal Updates of Children's Rights on the Protection and Shared Assets in Divorce Cases in Indonesian Family Law

Muhyidin

Lecturer at Diponegoro University, Semarang, Indonesia

Abstract

The focus of this research study is the law on the distribution of joint assets and child custody as a result of divorce against husbands and wives who work based on justice value. Article 97 Compilation of Islamic Law which determines that widows of divorced widows get a half share of the joint property. This is inseparable from the provisions of Article 31 and Article 34 of Law Number 1 of 1974 concerning Marriage. This study uses normative juridical method, sociological juridical method, and comparative juridical research method; and using decision data and interviews with judges of the religious courts, using critical paradigms and using inductive qualitative analysis. The results of the study were that the judge had begun to make legal discoveries. Factors that influence the ruling of the religious courts that do not bring about justice are substantial, structural, and cultural factors. The current division of shared assets and the rights of child ownership as a result of divorce is not yet fair, meaning that the construction of the distribution of shared assets and child rights as a result of divorce is currently granted by The reconstruction of the legal value of the distribution of shared assets due to divorce is carried out casually based on its contribution by taking into account the benefit and well-being of the company.

Keywords: *Child rights, custody, child care, marital assets, family law.*

Introduction

Marriage law is part of the teachings of Islam that must be obeyed and implemented according to the religious provisions. With the enactment of Law Number 1 of 1974 concerning Marriage, the reception theory by Snouck Hurgronje as taught in the Dutch East Indies era was erased formally[1]. The reception theory is a theory which states that Islamic law only applies in Indonesia to adherents of Islam, if something Islamic law has clearly been permeated by and in customary law[2]. By looking at certain articles in this Marriage Law there is no doubt to accept the argument that Islamic law has become a direct source of law without the need for assistance/intermediaries for customary law[3]. Marriage law that applies to all Indonesian people, namely Law Number 1 of 1974 concerning Marriage, was ratified and signed by the President Soeharto in Jakarta on January 2, 1974, and that day was also promulgated and signed by the Minister/Secretary of the Republic of Indonesia Maj. Gen. Sudarmono, as well as being included in the 1974 State Gazette no. 1 and the explanation contained in the additional sheet of the Republic of Indonesia No. 3019. This law contains 14 chapters and 67 articles. In it regulates the basis of marriage, conditions for marriage, marriage prevention, marriage cancellation, marriage agreements, rights and obligations of husband and wife, property in marriage, marriage termination and its consequences, child status, rights and obligations between parents and children, guardianship and other provisions[4,5,6].

For the smooth implementation of Law Number 1 of 1974 the government issued Government Regulation Number 9 of 1975 concerning Implementation of Law Number 1 of 1974. Government Regulation Number

9 of 1975 is contained in State Gazette No. 12 and its explanation in the Supplement to the State Gazette No. 3050. Government Regulation Number 9 of 1975 contains 10 Chapters and 47 articles. The study aims to examine further the case of the distribution of shared assets and the right of child care due to divorce of husband and wife. Different from the perspective offered in previous studies, this paper also aims to examine the right for child custody after divorce[7,8,9]. This is based on the assumption that there is an absence regarding clear arrangements regarding the distribution of shared assets, as well as child custody due to divorce in Islamic Marriage Law.

Marriage in Religious and Legal Perspectives: Marriage is very important in the lives of people, individuals and groups. By way of a legal marriage, the association of men and women takes place in an honorable manner according to the position of humans as respectable beings. Relationships of married life are fostered in an atmosphere of peace, tranquility, and affection between husband and wife. The offspring of the result of a legal marriage adorns family life and at the same time is a continuation of human life in a clean and respectful manner. Human relations between men and women are determined to be based on a sense of devotion to God and devotion to humanity in order to carry on the life of its kind. Marriage is carried out on the basis of the willingness of the parties concerned, which is reflected in the provisions of the marriage before marriage and consent granted in the marriage ceremony which is also witnessed before the public in an event. The rights and obligations of a husband and wife are regulated very neatly and in an orderly manner, as well as the rights and obligations between parents and children. If there is a dispute between husband and wife, it is also arranged how to deal with it. It also guided the customs of social courtesy in the family as well as possible so that harmony of life remains maintained and guaranteed.

From the foregoing, it can be seen that marriage has a very important position in Islamic law because the marriage law regulates family life procedures which are the core of people's lives in line with the position of humans as respectable beings over other creatures[10]. Opinion which states that the reception theory both as a theory and as a provision in article 134 paragraph 2 Indische Staatsregeling has been erased by the enactment of the 1945 Constitution. This can be seen in the 1945 Constitution article 29 paragraph (2), which contains provisions: The state guarantees the independence of each population to embrace their respective religions and to worship according to their religion and beliefs. From the provisions of article 29 paragraph (2), the government has the right to regulate certain issues based on Islamic law, to what extent these regulations are intended for citizens who are Muslim[11].

Child Rights on Shared Assets as Results of Divorce: Regarding the consequences of divorce against children Law Number 1 of 1974 concerning Marriage under Article 41 determines that the mother or father remains obliged to look after and educate their children, solely based on the interests of the child, if there is a dispute regarding childcare, the court gives its decision. The father is responsible for all the maintenance and education costs required by the child, if in fact the father cannot provide this obligation, the court can determine that the mother will share the costs. Article 149(d) Compilation of Islamic Law, stated that if the marriage is broken because of divorce, then the ex-husband is required to provide child custody fees for his children who have not reached the age of 21 years old[12,13,14]. According to Law Number 1 of 1974 and the Compilation of Islamic Law, parental divorce does not eliminate the obligation of parents to care for and educate their children. It is the father who is responsible for bearing the costs of maintaining and educating his children with the provisions that if in reality the father cannot fulfill his obligations, then the mother can also be burdened to bear the costs. As a result of divorce against a child is about the issue of parental power, with the divorce resulting in the termination of marriage, the court determined that each of the children who had not grown up who of the parents who do guardianship. Regarding the trusteeship it is up to the judge who determines and who will be appointed guardian only in the appointment must be considered the interests of the child.

Most people, especially parents or husband and wife, do understand and realize that caring for their child is an obligation. However, there are also those who mistakenly carry out child care, so that there are only those who are concerned only with the physical growth of their children and meet the material needs of children excessively, without regard to the child's mental growth and the spiritual needs of children in the form of attention to mental development and giving love affection for him. This mistake may be caused by the lack of understanding of the parents of the meaning and understanding of the child care, as well as the obligations that exist in it.

Child care is an authority to care for and educate people who have not been adults who have not sufficiently acquired their intelligence. The emergence of the child care problem is sometimes caused by divorce or because of death where children are not yet mature and are no longer able to take care of themselves, hence the need for people who are responsible for caring for and educating the child[15,16,17]. Child care is to equip children materially and spiritually, mentally and physically so that children are able to stand alone in facing life and later life when he is an adult. Child care covers all the needs of the child, physically and spiritually. So including child care is to develop the intellectual soul of children through education.

Islamic jurists agree that the mother is the person most entitled to do child care. However, they differ in matters, especially regarding the length of a mother's upbringing, which is most entitled after the mother and also about the conditions for being a caregiver mother. As long as there is no obstacle to taking care of the children, the mother must perform the child care unless there is an obstacle preventing her from carrying out the child care.

In the condition of the more dominant wife/greater contribution in meeting the needs of the family, the right of the child care due to divorce, the child in the care of the mother. This right will be erased if the mother behaves badly or because of desires the child himself (the child who has been in teenage has the right to choose to get child care from his father or mother, article 156 letter b of the Compilation). Thus, the husband (also applies to the wife) can also ask for custody of the child based on the best interests of the child, by proving the arguments that one of the parties apparently cannot be used as a role model for children. In other words one of the parties cannot carry out a good obligation as a parent to their children, in the same conditions. First, one party commits adultery or becomes a drunkard, compactor, gambler, etc. that is difficult to cure; second, one party has left the other party without the permission of the other party and without a valid reason or because of anything else beyond its ability; third, one party gets a prison sentence; fourth, one party commits atrocities or severe persecution that endangers the other party; fifth, in carrying out the activities of caring for children so far, it turns out that it is no better than the party that submitted it; and/or other reasons[19].

Article 156 of the Compilation point b stated that as a result of the marriage breaking up due to divorce are that children who are in teen have the right to choose custody of the child from their father or mother. One thing that needs to be warned is that whoever is ultimately chosen to be followed, the success of education in order to become a godly child becomes the joint responsibility of his father and mother. Everything is discussed together, divorce father and mother do not result in the child being a victim. The child should never instill hatred to parents, mothers should not make the father's name in the face of the child, and vice versa. The child who follows the father should not be separated at all from his mother and the child who follows the mother should never be separated from his father's relationship.

Conclusion

The current division of shared assets and the rights of child ownership as a result of divorce is not yet fair, meaning that the construction of the distribution of shared assets and child rights as a result of divorce is currently granted by Marriage Law No. 1 of 1974, Compilation of Islamic Law has not fulfilled a sense of justice. The factors which influence the distribution of shared assets and the rights of the children of a child due to divorce are not based on justice. The reconstruction of the legal value of the distribution of shared assets due to divorce is carried out casually based on its contribution by taking into account the benefit and well-being of the company. The provisions of article 97 the Compilation will not be considered fair and cannot explain or resolve if there is a case of a wife other than as a housewife as well as a household regulator, the wife also contributes to family needs. The judge needs to make a legal discovery. The right to child care often becomes a problem after divorce. This study uses normative juridical method, sociological juridical method, and comparative juridical research method; and using decision data and interviews with judges of the religious courts, using critical paradigms and using inductive qualitative analysis. The results of the study were that the judge had begun to make legal discoveries such as in the decision of the Padang High Religious Court with No. 38/Pdt.G/2013/PTA.Pdg. by adjudicating themselves, namely establishing joint assets of 1/3 part for the plaintiff (husband) and 2/3 part for the defendant (wife) on the basis of consideration in obtaining joint property of the plaintiff and defendant during the marriage, the defendant is more dominant and plays an active role as a civil servant. Factors that influence the ruling of the religious courts that do not bring about justice are substantial, structural, and cultural

factors. The development of the value of the division of shared assets due to divorce is carried out casually based on its contribution by taking into account the benefit and well-being of it. The development of the value of child custody due to divorce is based on orientation in child care is solely for the benefit, benefit and benefit of the child concerned. The theory of case law with justice and prosperity can be used as a contribution in the formation of national law in the field of marriage, especially to re-construct article 37 of Law Number 1 of 1974 and Article 97 of Compilation of Islamic Law.

New Treatment for Regular Astigmatism Using Physical Exercises

Mundher Sameen Shuker

Assist Prof., Department of Optics Technology, College of Health and Medical Technology, Middle Technical University, 10047 Bab Al Muadham, Baghdad, Iraq

Abstract

Introduction: Regular Astigmatism is one of the most common problems for the eye; it makes a patient unable to see things clearly. Therefore, the aim of the study estimates the incidence of regular astigmatism among age group (10-32) years by using physical exerciser in the college of health and medical technology. We perform therapeutic exercises in an applied scientific way to activate the towed eye muscles by the pulled during treatment sessions to get rid of regular astigmatism and improve vision without the use of glasses or surgery to patients.

Materials and Method: The method used in this study was a cross-sectional analysis of 100 cases (51 males) (49 females) with different types of astigmatism through physical exercise. The data analysed using the SPSS package program.

Results: We found the compound astigmatism (58%) is higher than simple astigmatism (33%), as well as the compound astigmatism is higher than mixed astigmatism (13%). Also, we found to improve in (90%) patients treatment for continuous exercise as requested by the therapist.

Conclusion: This study that most patients of Astigmatism were compound and improvement in 90% of cases treatment by physical exercise and did not need to use any glasses to read during the examination and get 'Visual Acuity' VA=6/6.

Keywords: *Regular Astigmatism, Physical Exercises, New Treatment, Visual Acuity, Astigmatism Treatment.*

Introduction

Astigmatism, considered to be one of a group of eye defects with certain sights, including myopia and hyperopia, known as Refractive Errors (R.E)[(1)]. This is also the concept of the inability of the cornea to focus the image on the retina; the effect is a blurred picture of the patient[(2)]. As they influence light refraction in the eyes, this creates a change in the way light beam focused in the eye,it simply means that the shape of your cornea is different[(3)] . Many symptoms may include eyestrain, headache, and night driving problems[(4)]. The stigmatism has many classifications, but there are two types of astigmatism, which are determined by the shape of the cornea: Irregular Astigmatism, and Regular Astigmatism[(5,6)]. The two terms are defined:

Irregular Astigmatism is a kind of astigmatism that arises from the disruption of light rays caused by a cornea lens disorder[(7)]. Interruption is usually caused by illness or injury in one of these areas of the eye, resulting in surface irregularity and, consequently, distortion of the light rays that reaching the eye[(7)]. This type of astigmatism is only treated with surgical procedures or special type of contact lenses and will not be emphasized in this research.

Regular Astigmatism also, there is a type of astigmatism in different areas of the eye[(7)], while light is not focused on the centre of the retina in normal conditions if the stabilizing beam is called near-sightedness or hyperopia in the retina in front of the eye[(8)]. There is one trend in all cases of regular astigmatism where the lines are very far and one in the right corners of this where conventional lenses (lenses, contact lenses, and surgery) tend to be more confusing and accurate. But today we

correct the curative exercises of weak eye muscles in a different way from the previous one, and it is called muscle stimulation[9]. This type of astigmatism has three classes (simple astigmatism, complex astigmatism, and mixed astigmatism), and these types are known as:

A -Simple Astigmatism; is the one area of the eye is regular while the other is either myopia or hyperopia; therefore, when two or perpendicular lines have been seen, the line representing myopia or hyperopia is out of focus and blurred while the other line is clearly focused (10). The simple type of astigmatism is corrected by means of cylindrical lenses that guide the out of focus beam of the eye according to the power required [7,10].

A- Compound Astigmatism Two primary meridians are described (Myopia, or Hyperopia). 1- Composite Astigmatism of Myopia, a beam in all meridians in front of the eye comes to a concentration. 2- Hybrid astigmatism with hyperopia, a pulse in both meridians is focussed in the retina[11].

B- Mixed Astigmatism; one of the definitions of the meridian is myopia, while the other is hyperopia. In combination and mixed types, the ring is attached to the spherical lenses to create a clear image[11,12].

The incidence of astigmatism usually refers to the overall population of people who treat it at any given time[13] · The incidence of high levels of astigmatism among Americans is greater (1D)*. That key fundamental causes have postulated is inherited.

In 1995, 11% of schoolchildren in Taiwan had astigmatism (1D-2D) and 1.3% (3D). While in 2000 it was 13% had astigmatism (1D-2D), and 1.8% (3D). The incidence of myopic astigmatism increased with age, but the comparison is a reduction in the rate of hyperopic and mixed astigmatism with age 17 years [14]. Most of the children had astigmatism were from East Asia 17.2%, the Middle East 4.9%, and South America 0.9%[15].

*(D = Dioptre)

Astigmatism treatment at first, if the degree of astigmatism is small, and there are no other refractive problems, such as Myopia or Hyperopia, corrective lenses may not be required[11]. While, if the degree of astigmatism causes visual loss or pain, it will prescribe prescription lenses[16]. However, there are very effective alternatives, such as eye robins, which allow a clear vision of contact lenses or glasses to be restored naturally[17]. There are three common types of Astigmatism treatment:

1. Eye-glasses: a method of correction for people with astigmatism. In order to account for astigmatism, it must contain a special cylindrical lens prescription in only specific lens meridians; this provides additional lens power [18]. A single vision lens is a clear vision at all distances, but when the patient is 40 years of age, it is considered presbyopia[17,19].
2. Contact lens (C.L): is a better vision than eyeglasses; it can provide a clearer vision and a wider FOV because C.L is worn directly on the eyes, but regular cleaning and care are needed to protect and safety of the eyes[20].
3. Surgery: it has two method of astigmatism treatment by surgery. First, Implantation of contact lens: Recent attempts to surgically implant contact lenses for correction of regular astigmatism have also been found effective[21]. Second, refractive surgery (LASIK): improves vision and removes the need for eyeglasses and contact lenses[22,23]. Your eye surgeon uses a laser beam to reshape corneal curves to correct astigmatism before surgery[23,24]; doctors will assess you and determine whether or not you are a candidate for LASIK astigmatism[25,26].

Materials and Method

Materials: The research group consists of 100 patients with Regular Astigmatism (51 Male, 49 female). All patients were exposed to regular physical activity, astigmatism therapy, and attending the clinical advisory in the Medical and Health Technology Collage. It was the criteria for selecting patients with astigmatism and determines the level of natural astigmatism at the age of 10-30 years. Then all information was done by means of a direct questioner, including (age, gender, family history, and glass wearing).

Method: The method will use four-step procedures for regular astigmatism. Initially, the use of the (automatic refractormeter) for an automatic tool automatically measures the power of eye focus. Second (visual acuity); This test was used to measure the VA, requesting the patient to read messages using the Snellen chart or cubes. Third (retina range), the patient adjusts and looks directly at the Snellen chart for about 6 meters, the doctor holds the instrument for about 0.5 to 1 or 1.5 meters, and light from the device directs the patient's eye to see the type and measure the degree of regular astigmatism for each individual eye. Finally, conducting therapeutic exercises in an integrated scientific way to stimulate the muscles

of the eye without closing the healthy eye after placing the cornea in the centre of the eye and using a principle pinholl and then the eyes are drilled without movement for a period of 15 minutes depending on the experience of the therapist until a straight movement in addition to conducting training at home before Parents need to maintain the amount of improvement that they got in each session of treatment sessions to get rid of regular astigmatism. Initially, using glasses for three sessions occurs to determine the extent of improvement exercises and then the continuous exercise without glasses.

Results

In the beginning, it is noted that most types of treatment use glasses and in the case of leaving or not wearing the glasses are returned to their old position. But in this method, what has been done to the patient by means of therapeutic exercises to stimulate the eye muscles and to conduct an optician test without affecting the eye and the possibility of getting VA=6/6 and removing the glasses, the results show all that.

Table (1) shows the samples were 100 patients, split into 51% male and 49% female. Higher percentages at age groups 10-15 years were ratio formed 51%, while the proportion was 11% for people 22-27 years of age. This means that the highest percentage is children, so the patient's family needs to help the patient conduct therapy exercises.

Table (1): Distribution of cases of regular astigmatism according to age groups (years) and gender.

Age Groups (Years)	Male		Female		Total	
	N	%	N	%	N	%
15-10	29	29%	22	22%	51	51%
21-16	06	6%	19	19%	25	25%
27-22	06	6%	05	5%	11	11%
Up to 32	10	10%	03	3%	13	13%

It is evident that the aetiology of the types of daily astigmatism in 100 patients is the majority of smart devices such as (x-box, play station, and mobile) where the proportion 67% of the total causes is considered to be the most common among other causal types. While, it was found 25% because of continuous reading with neglect of wearing glasses and lack of therapeutic exercises. We also found that compound astigmatism has been aggravated in 58% of cases. Table (2) show the distribution of all 100 patients according to causes by types of regular astigmatism.Also, It is evident from Table (3) that the case with compound Astigmatism were 58% regular the distribution of astigmatism according to age groups (years), which found that 20 cases were having compound astigmatism & were at age group 16-21 years.

Table (2): Distribution of samples according to causes by types of regular astigmatism.

Types of Regular Astigmatism	Causes			Total
	Smart Devices	Continuous Reading	Others	
Simple Astigmatism	22	8	3	33
Compound Astigmatism	40	14	4	58
Mix Astigmatism	05	03	1	09
Total	**67**	**25**	**8**	**100**

Table (3): Distribution of cases of regular astigmatism by age (year) and type of regular astigmatism.

Age Groups (Year)	Type of regular astigmatism			Total
	Simple	Compound	Mixed	
10-15	10	15	3	28%
16-21	15	20	4	39%
22-27	5	13	2	20%

According to Visual acuity (VA) of patients with glasses, the highest rates of patient physical exercise therapy 94.8% found 55 cases out of 58 whose visual accuracy exceeds the compound form of regular astigmatism. In contrast, the lower rates of patient physical exercise therapy 44.4% in 4 cases out of 9 of their VA with glass reaches in mixed astigmatism. Table (4)show the distribution Visual Acuity (VA) of cases without glasses and form of Regular Astigmatism (simple, compound, and mixed) before and after treatment without glass.

Table (4): Distribution Visual Acuity (VA) of cases of Regular Astigmatism (R.A) before and after treatment without glass.

Type of (R.A) VA	Type of Regular Astigmatism (R.A) before and after treatment						Total	
	Simple		Compound		Mixed			
	Before	After	Before	After	Before	After	Before Treatment	After Treatment
C.F- 6/60	12	12	20	19	3	2	35	33

R.A= Regular Astigmatism, VA= Visual Acuity, C.F = Count Figure

Table (5): Distribution of cases of regular astigmatism by groupage and family history.

Family history Age	Family history				Total	
	Positive		Negative			
	N	%	N	%	N	%
10 – 15	15	37.5%	25	41.5%	40	40%
16 – 21	12	30%	20	33.5%	32	32%
22 – 27	7	17.5%	10	16.5%	17	17%
Up to 32	6	15%	5	8.4%	11	11%
Total	**40**	**40%**	**60**	**60**	**100**	**100%**

Table (5) shows that cases with a negative family history of astigmatism accounted for more than 60% of those without a negative family history, particularly those with a 41.5% negative family history age group of 10-15 years.

Discussion

The number of males is marginally higher than that of females for a retrospective study of medical data on 100 patients, the proportion of males is 51 %, while the ratio of females is 49%. In this study, we found that 52% of patients have a complex type of normal astigmatism and that most patients have modified the way visual acuity(VA) is viewed from prescription glasses to physics therapy exercises. This is the ease of therapeutic exercises with the use of medicinal drugs and 90% of patients have been treated, most of them were the degree of vision produced 6/6 without glasses.

It also found that the prevalence of astigmatism in patients between the ages of 10 and 15 due to the excessive use of electronic devices (smart devices) and their inability to wear glasses when continuous reading is caused by a higher prevalence of 16 % between the ages of 16 and 21. For this report, the number of patients who use smart devices are 67% .According to a study carried out in the United States, we found similar results in which compound astigmatism is more prevalent among students than simple and mixed astigmatism. In addition, Family history is a significant risk factor in children with regular astigmatism.

Clinical initiatives and identification of method of treatment have shown how patient outcomes can be improved, that is, by recognizing and moving weak eye muscles and finding the test. During exercises 1-6 sessions, the patient turns the eye in all directions and forces it forward to minimize the eye muscle pressure by about 15 minutes to strengthen the weak eye. Therefore, both patients were treated and strengthened in the degree of concern of each session with therapeutic exercises and did not need to use any glasses to read during the test and to achieve ‘ visual acuity ‘ VA=6/6.

Conclusion

It was recommended that all patients should be tested for their visual acuity and that all cases of astigmatism (regular astigmatism) should be treated with glasses at first and checked every six months to see the difference in the degree of astigmatism that, if any, or any complications in the eye due to misuse of smart devices (It is necessary to use MC-lenses to prevent harmful radiation from smart devices). It must to treat by Physical exercises and at least advised the patient wearing glasses and conduct exercises according to instructions the therapist. After the end of this study are advised to adhere to therapeutic exercises to get rid form correct regular astigmatism. Upon completion of this research are advised to adhere to therapeutic exercises to get rid form regular astigmatism.

Acknowledgments: The author would like to thank the patients who have kindly offered their time to take the information and confidence in the treatment method. The author would also like to thank the College of Health and Medical Technology, Middle Technical University, Baghdad, Iraq, for their moral support.

[3]Postgraduate, Department of Paediatric Maxillofacial Surgery, Tashkent State Dental Institute, Uzbekistan

Abstract

In this study was to analyse the patterns of maxillofacial fractures in children under 18 years of age admitted at paediatric maxillofacial surgery department in Tashkent state dental institute, Uzbekistan in a period of 12 years between January 2007 and December 2018.Out of 757 children with maxillofacial bone fractures, the majority were aged between 6-18 years (78,6%, n=595). The mean (±SD) age was 9.3±0.5 years and male to female ratio was 6.2:1. Falls was the most frequent mode of injury (46,9%, n=355). The mandible was most commonly involved (67.2%, n=509) of the cases. The incidence of paediatrics maxillofacial fractures in Uzbekistan region was high. The 6-18-year olds and boys were most commonly involved in maxillofacial paediatrics trauma. Mandibular fractures were the most common type of fracture. Safety programs should be instituted in Uzbekistan region to increase public awareness and to decrease morbidity resulting from paediatrics maxillofacial trauma.

Keywords: *Paediatric, Maxillofacial area, Trauma, Mandibular fractures.*

Introduction

Head injuries of children are common, comprising more than half of all injuries sustained. The mortality and morbidity rates associated with traumatic head injury in children are high and the majority of deaths due to trauma in children are caused by brain injury[1,2]. Trauma is a leading cause of injury and death among the paediatric population. There is a pattern of facial fractures by age that is influenced by trends in the mechanism of injury and facial development. Cranial and central facial injuries are more common in toddlers and infants and mandibular fractures are more common in adolescents and beyond. A large proportion of facial fractures were caused by fall[4,5]. The exponential rise in the incidence of facial fractures associated with skull fractures in children reflect the growth and development of the face to downward and forward direction that make it more susceptible to trauma. Paediatric facial fractures account for 25% of all maxillofacial injuries[1,3,6,7,8,11].

The most prevalent cause of facial fractures in paediatric patients are accidental falls (58.2%) including falling on the floor when playing, falling from bed and stairs, and falling from height, followed by violence (12.7%), bicycle (10%), and motor vehicle accidents (8.2%). Sports injuries represented only 7.3% and others 3.6% [2,5] Nasal fractures were the most common (69.1%) and condyle was the most common site of mandibular fractures (63.2%). The mandible was the most common bone to fracture (65%) and the body of the mandible was the commonest site to be involved by fracture (27%). Only 10% of cases involved both jaws[12]. The zygomatic bone appeared to be the most common bone involved in mid-face fractures (45%)[6].

The minimally displaced mandibular fracture is usually managed by a short course of maxilla-mandibular fixation (MMF) usually 21 days using elastics[6,9,10]. The use of open reduction and rigid internal fixation without maxillomandibular fixation also has obvious advantages for the management of children with multiple injuries. The aim of this study was to analyze the patterns of facial fractures in children up to eighteen years of age admitted at paediatric maxillofacial surgery department in Tashkent state dental institute, Tashkent city, Uzbekistan retrospectively in the last twelve years (2007-2018).

Material and Method

All paediatric patients under 18 years admitted at the department of paediatric maxillofacial surgery of Tashkent state dental institute diagnosed with maxillofacial fracture were included in this study. The study was a twelve years retrospective study from January 2007 – December 2018. The data collected from the patients records included, age, gender, etiology, type of injuries.

Inclusion Criteria: All paediatric patients under 18 years admitted to paediatric maxillofacial surgery department with maxillofacial bone fractures.

Exclusion Criteria:

1. Fractures involving the skull vault or frontal bone were not included in the study because children with cranial bone fracture are usually referred and managed by neurosurgery according to the hospital policy.
2. Soft tissue injuries were not included in the study as they are mainly treated at emergency departments without recording.
3. Patients with dental trauma also were not included in the study as they were either managed at emergency departments without recording or refereed to pedodontist at dental center.

The study was conducted at the department of paediatric maxillofacial surgery at Tashkent state dental institute following the approval from research centre of Tashkent state dental institute and hospital ethical committee. Statistical analysis was performed using Statistical Package for Social Sciences (IBM SPSS), Version 25.0 for Windows 10.

Results

The incidence of paediatric maxillofacial fractures in relation to age group: out of 757 children with maxillofacial bone fractures, 78.6% (n=595) were 6-18 years (school age) old and 21.4% (n=162) were under 5 years (pre-school) of age. It can be seen that children in the 6-18 years age group were more commonly involved with a peak incidence at <12 years. The mean age was 9.3±0.5 (SD) years, ranging from 2-18 years. Gender distribution showed that 86.1% (n=652) were males and 13.9% (n=105) were females with a male to female ratio of 6.2:1.

Falls were the most frequent mode of injury (46.9%, n=355), followed by sport (26.8%, n=203), bicycle accident (21.1%, n=160), and RTAs (5.2%, n=39). The mandible was most commonly involved (67.2%, n=509), followed by nasal 14.9% (n=113), dentoalveolar fractures (8.1%, n=61), zygoma (5.9%, n=45), maxilla (3.8%, n=29) fractures, respectively.

Cross-tabulation showed 6-18 years age group was more likely to have facial fractures in all sites. Association between gender and site of facial fracture by cross-tabulation showed male were more likely to have facial fractures in all sites than female shows the association between site of paediatric facial fractures and mode of injury. All sites of fracture except dentoalveolar were more likely to be due to falls. Dentoalveolar fracture was more likely to be due to sport.

Discussion and Conclusions

The current study showed that males were more susceptible to facial trauma than females. More frequently young children sustain injuries from low-velocity forces than older children who are more likely to be exposed to high velocity forces[12]. In the present study, falls were the most prevalent etiological factor of facial fractures. This is in agreement with the reports by Lee (2009)[5] who stated that falls are a major health hazard.

The mandible was the most common site (67.2%) which is in agreement with the majority of studies which have reported the mandible as being the most common bone involved in paediatrics facial fractures[13,14].

The twelve years incidence of paediatrics facial fractures in Uzbekistan region was higher in 6-18

year olds and boys were more commonly involved in maxillofacial paediatrics trauma. The most common etiological factor was falls. Mandibular fractures were the leading type of fracture. This data serves as a warning to maxillofacial surgeons to provide the proper and early management to prevent farther facial asymmetry or occlusion disturbances. It is also recommended that researchers should conduct future studies analysing the post-operative deformity for the managed children in the same hospital.

Effect of Blood Groups and Complications on Orofacial Measurements of B Thalassemia Adult Patients

Nada Hashim Mohammed[1], Nawal Mustafa Abdullah[2], Riad Altaee[3]

1Lec./MB,ChB, MSc Anatomy, Department of Anatomy/Al Zahraa College of Medicine, University of Basrah, [2]Assist- Prof/MB,ChB, MSc, PhD Anatomy, Department of Anatomy/Al Zahraa College of Medicine, University of Basrah, [3]Assistant Prof/B.D.S, College of Dentistry/University of Basrah

Abstract

Background: β- thalassaemia is a common hereditary disorders in Iraq and worldwide .with different treatment schemes,, including blood transfusion, iron chelation and splenectomy, patients with B thalassemia may develop different skeletal changes. Limited studies link these complications with orofacial changes, This study aimed to evaluate the orofacial dimensions in β- thalassemia patients with age, gender, blood groups, splenectomy and cholecystectomy and to assist surgeons for planning their future intervention.

Method: This study was conducted on 130 ß-thalassemia patients of both gender,,and two age categories (20-30 yrs), & (21-40 yrs), five orofacial measurements (face,eyes,nose,mouth and ears) and sixteen parameters were measured and calculated for differences,P value is estimated,data analysis were done by using Chi square test and SPSS version 20

Results: Significant findings were found for mandibular width and mouth width at older age group (31-40 years), the nasal width and ear height are more in male, patients with splenectomy have significance for lower 1\3 face and ear width. Cholecystectomy increase eye length measurments and ear height but for blood groups the $P > 0.05$

Conclusions: Orofacial bone changes are pronounced in β- thalassaemia with distinct findings regarding sex dimorphism, older are more prone to have variations, earlier splenectomy is advisable,cholecystectomy is better choice for symptomatic patients, blood groups have no significance.

Keywords: *βThalassemia,,Blood groups, Orofacial measurments, Complications.*

Introduction

Thalassemia are group of single gene inherited hematological disorders caused by deficiencies in the synthesis of hemoglobin chains that cause haemolytic anemia[1]. ß-thalassemia major is the most severe form leading to severe anemia in infancy or childhood and used to be life threatening in absence of regular red cell transfusions[2]. Various studies found that patients with blood group O are more risky to develop ß thalassemia[3,4]. The common symptoms of the disease include severe anemia, poor growth, delayed sexual maturation,splenomegaly and gall bladder bilirubin stones, if patients are symptomatic, they may require laproscopic cholecystectomy,could be at the same time as the splenectomy.[5-8]

Patients with ß thalassemia commonly have skeletal abnormalities including limbs,vertebral column,skull and bones of the face, commonly called squirrel –like face[9]. Theorofacial bone changes are the results of ineffective erythropoiesis, the bones become thinner with pathological fractures may occur due to overexpansion

University of Basrah
e-mail: nawal.abdullah@uobasrah.edu.iq

of the bone marrow and extra medullary region and this is frequently noticed in patients who receive insufficient or irregular blood transfusions[10,11]. Patient survival depends on regular blood transfusions and iron chelating therapy,In spite of being an effective cure but there are many serious associated long-term problems. Iron toxicity (hemosiderosis) will lead to hepato splenomegaly which end with organ damage,surgical intervention and impaired growth [12,13] .

Different orofacial dimensions include face, eyes, nose, mouth and ears of thalassemia patients have significant differences from normal individuals which is documented in many studies[14,15] Although B thalassemia is a leading health problem in Basrah, southern of Iraq but limited published data were available on orofacial measurements therefore the aim of the study is to evaluate the effect of age,gender, blood groups, splenectomy and cholecystectomy on orofacial bone changes and determine their clinical outcome in thalassemia patients .

Material and Method

The present study was conducted during the period from August 2019 to March 2020, data obtained from a total number of 130 adult B Thalassemia Major Iraqi patients from Basrah city (72 female and 58 male) who attended to the thalassemia center for Hereditary Blood diseases at Basrah Maternity and Child Hospital irrespective to their social or educational backgrounds .All patients were diagnosed previously based on hemoglobin electrophoresis or high-performance liquid chromatography and submitted to frequent blood transfusions. The age ranged between 20-40 years. Patients were divided according to age into two groups, 21-30 age group, and 31-40 age group. Patient's data including age, sex, weight (in kg), and height (in cm), were obtained and evaluated . All patients receive different treatments and blood transfusion.

Verbal consent obtained from each participantin this study and the approval of the Ethical Committee of Al Zahraa Medical College/University of Basrah and Centre for Human Development of Basrah Health Authority (Ref. No. 261 at 13/5/2019} was obtained . The standard instruments used in this study were calipers and measuring tape, Fig. 1 & 2

Surface landmarks were marked on the face before taking the standard anthropometric measurement according to Farkas method[16]. The head orientation was achieved by positioning the head in Frankfurt horizontal plane aligned parallel to the floor. Three anatomical landmarks determined the facial midline: the nasion, the subnasal, and the gnathion. "Fourteen linear and two angular measurement taken, these are:.

1. Face: Face width (zy- zy), Face height (n- gn), Upper face height (n- sto), Maxillary depth (t- sn), Mandibular depth (t- gn).
2. Nose: Nose width (al- al), Nose height (n- sn), Nasal tip protrusion (sn- prn)
3. Eyes: Biorbital width (ex-ex), Intercanthal distance (en- en), Palpebral fissure length (en- ex).
4. Mouth: Mouth width (ch- ch), Lower lip height (sto-ls), Upper lip height (sn- sto).
5. Ears: Ear width (par- pa), Ear length (sa- sba).

Facial measurments are taken in millimeters.

A comprehensive analysis of data was achieved by using SPSS version 20 and Chi square test

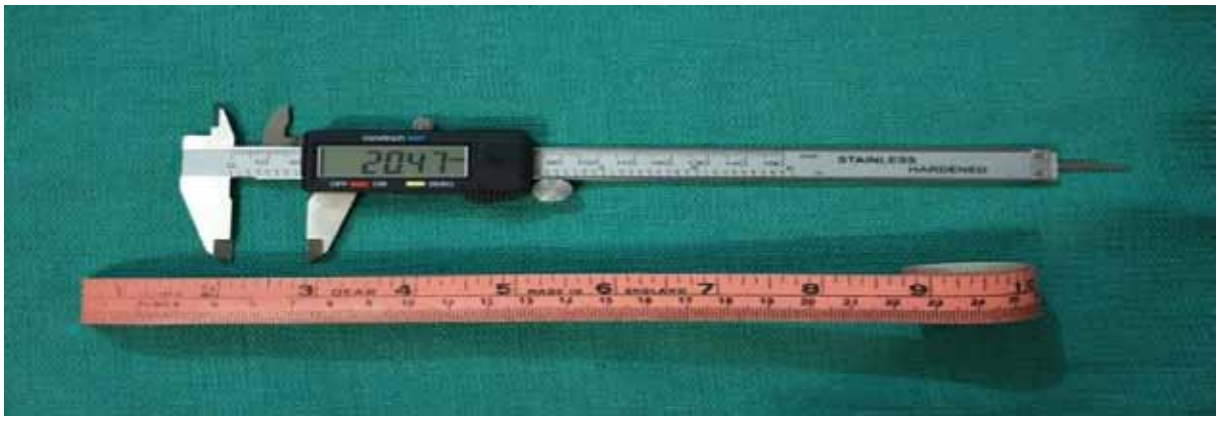

Fig. 1: The vernia and measuring tape

Fig. 2: Orofacial measurments

Results

A total number of 130 B - thalassemia adult patients of both gender (72 male/58 female; 1.2/1),age range from 20 to 40 years were enrolled in this study for estimating orofacial measurments (OFM).

Significant differences were found between different age groups regarding face, ear, eye, and nose, the mandibular depth (t-gn) show high results at age group 31-40 years ($p = 0.022$) and the mouth width (ch-ch) show significance at older age group also ($p = 0.041$). Table 1.

Table 1: Relation of age to OFM of B thalassemia patients

OFM		Age Group		
		20-30	31-40	
Face	Face width (zy-zy)	96.1	99.3087	0.129
	Facial height (n-gn)	107.1111	107.8261	0.801
	Upper facial Morphological height (n-sto)	68.7944	72.3957	0.099
	Maxillary depth (t-sn)	117.1278	118.9174	0.505
	Mandibular depth (t-gn)	128.0472	135.7652	0.022
Nose	Nasal width (al-al)	34.9139	35.4783	0.527
	Nasal height (n-sn)	48.0222	51.3783	0.083
	Nasal length (sn-pr n)	14.7778	17.2391	0.136
Mouth	Mouth width (ch-ch)	42.8556	45.6696	0.041
	Lower third face height (sn-gn)	59.0222	58.0826	0.616
Eye	Outer eye space (ex-ex)	90.8333	91.1261	0.94
	Inner corner eye space (en-en)	33.3306	34.0174	0.344
	Eye length (en-ex)	30.6806	31.5	0.373
Ear	Ear width (pra-pa)	36.6861	37.1261	0.785
	Ear Height (sa-sba)	54.9417	56.4917	0.367

$P<0.05$ is significant

No significant differences were detected between male and female in orofacial measurement, except for nasal width (al-al), and ear height (sa-sba) which show higher results in male patients (p = 0.019), (p = 0.011) respectively Table 2.

Table 2: Relation of Sex and Orofacial measurements of B thalassemia patients

OFM		Sex		P-value
		Female	Male	
Face	Face width (zy-zy)	96.5364	98.3846	0.377
	Facial height (n-gn)	105.9182	109.2577	0.228

Discussion

The ultimate cure of transfusion dependent thalassemia is bone marrow transplantation, but this is very costly procedure for the majority of patients, their survival, therefore, depends on regular blood transfusions and iron chelating drugs It was found that severe anemia, frequent blood transfusion,,iron over load and chelation drug toxicities and bone changes are common complications of this hereditary disease [17,18]. The pathogenesis of skeletal changes is still unclear in spite of the enhanced treatment,, patients used to have derange in bone mineral turnover with raised resorption rates and inhibition of osteoblast action which result in diminished bone mineral density (BMD) clearly evident asosteoporosis in the vertebrae,skull and face[13,19].

The results of the current study showed that the number of male affected by thalassemia are higher than females (M :1.3\ F :1). However the differences were not significant. Our study is consistent with a study of Baghianimoghadam *et al*. 2011, and Hannan et al,2018[20.21], bone changes are more common in older age group,(31-40 years old) for mandibular depth (135.76mm) and mouth width (45.66mm) as in Table 1 Furthermore the study found that the relation of sex and orofacial measurments were significant in patients with B thalassemia, the facial variations of nasal width (36.25) and ear height (57.89) are higher in male than female Table 2.

Bone changes in adult thalassemia patients can be explained on the bases that chronic anemia increases erythropoietin secretion, lead to bone marrow expansion and thinning of bony cortices beside overloaded iron interferes with growth of osteoid and deposited in hydroxyapatite crystals thus effecting the normal bone mineralization furthermore desferoxamine (iron chelator) prevents DNA synthesis, proliferation, and maturing of fibroblasts and osteoblasts which enhance the skeletal deformities in thalassemia[22,23]. Different blood groups have no significant effect in changing craniofacial parameters as shown in table 3.

Splenectomy result in minor changes on orofacial parameters in thalassemia patients,differences were seen for lower third face (60mm) and ear width (35.3mmL) when compared with those without splenectomy as in Table 4 . Spleen is most commonly affected organ in B thalassemia due to excessive destruction of abnormal red blood cells, extra medullary hematopoiesis, and transfusion overload. The splenectomy definitely reduce blood need therefore improve hemoglobin level but seems to have prolonged orofacial changes[24,25]. In severe cases bone changes could be minimized when splenectomy is done as early as possible.

Cholelithiasis (gallstones) is well known complication in patients with thalassemia major: (TM) .Several possible explanations for this observation, including older age, high degree of ineffective erythropoiesis, whenever symptoms found, cholecystectomy must be done with follow up to prevent complications like obstructive jaundice and cholangitis[26]. Table 5 showed significant effect of cholecystectomy on orofacial measurements regarding eye length (p=0.00) and ear height. (p=0.019).

Further studies may assist in better understanding of the pathogenetic mechanism underlying bone anomalies in B thalassemia patients and it is needed to develop useful treatment therapy like use of bisphosphonate in early osteoporosis which is an effective regime to minimize the severity of skeletal complications, new-generation of iron chelators may reduce the negative effects of deferoxamine on bone metabolism. and to improve the nutritional,hormonal deficits with the help of physical training programs.

Conclusion

The screening for carriers, premarital regulatory rules and counseling programs, can help in decreasing the incidence rate and complications although a high prevalence of thalassemia in Basrahsouthern Iraq was observed,Results had shown sex dimorphism,older age groups are prone to have obvious bony changes,earlier splenectomy is advisable in severe cases, cholecystectomy is done whenever symptoms are found, ABO blood groups have no remarkable changes on OFM.

Prevalence of Oral Maxillary and Mandibular Tori among Outpatients Attending Dental Collage in Basra Governorate Southern of Iraq

Nadia Azzam Al-Shareeda[1], Majed Mohamed Refaat[2], Abdullah M. Hussain[3]

[1]Assistant Lecturer, Pedodontics, Orthodontics and Preventive Dentistry, College of Dentistry, University of Basrah, Basrah, Iraq, [2]Assistant Lecturer, Prosthetic Dentistry, [3]Assistant Lecturer, Restorative and Aesthetic Dentistry, College of Dentistry, University of Basrah, Basrah, Iraq

Abstract

The objectives of the study is the assessment of torus palatinus (TP) prevalence as well as torus mandibular is (TM) among different gender and age groups. Seven hundred and fifty (750) out door patients (380 male and 370 female) were tested for the tori presence or absence at dentistry collage in Basrah city between January 2019 and June 2019. Sex, gender and location factors were evaluated. The prevalence rate of TP was 4.73% for male and 5.13% for female, and the prevalence rate of TM was 2.36% for male and 3.24% for female. In females, TP prevalence was more compared to males. The TP incidence more commonly in middle aged persons, While the TM more commonly in older persons.

Keywords: *Exostosis, Prevalence, Tori.*

Introduction

Tori arenon-pathologic bony exostosis that are consist of dense cortical bone covered by thin mucosa with poor vascularization[1]. Thin mucosal membrane covering the tori easily traumatized by removable dental prosthesis unless adequate relief is provided. Surgical removal is mandatory if large exostosis cause trauma or interference with artificial removable replacement insertion or with its function[2]. TP mostly found along the mid suture of the hard palate, and TM located in areas of premolar and canine at the mandible lingual aspect, usually bilateral[3]. TP has four shapes flat, nodular, lobular and spindle[4.5]. The etiology of both tori has been subjected multifactorial due to genetic, mastication, environmental and continued growth[6,7]. TP has been found more common in females, while TM more frequently in males. Tori usually are noticed in young and middle age adulds[8].

Objectives: The study aimed to investigate the location and prevalence of TP and TM. Also determine the correlation between current findings and population gender and age.

Materials and Method

Patients of seven hundred and fifty (380 male and 370 female) randomly selected outdoor admitted at Dentistry College/Basrah University between January to June 2019. Detailed questioner sheet prepared for the study, subjects were stratified depend on their age into 5age categories: (20-29, 30-39, 40-49, 50-59, ≥60 years).To prevent inter examiner bias, one author clinically examine all the subjects for tori absenceor presence through clinical palpation and inspection, the subject who has questionable tori was excluded. Raised bony exostosis located in the hard palatal midline defined as torus palatinus, raised bony exostosis situated in mandibular lingual aspect defined as being torus mandibularis.

The collected data were inserted in a computerized spreadsheet (Microsoft Excel 2013) and analyzed by SPSS version 20.

Results

Among the 750 male and female studied subjects, 58 person found having tori with a prevalence rate of 7.73% as shown in table 1. TP was presented in 37

subjects with a prevalence rate of 4.93% the males were 18 (4.73%) and the females were 19 (5.13%), whereas TM was detected in 21 subjects expressing 2.8 % prevalence rate,males were 9 (2.36%) and the females were 12 (3.24%). Table 2 summarize this distribution according to sex.

Table 1:Tori Prevalence in different groups

Age Groups	M+F (Total)	M+F with tori	% Prevalence
20-29	175	9	5.14
30-39	170	15	8.82
40-49	175	19	10.85
50-59	150	10	6.66
≥ 60	80	5	6.25
Total	**750**	**58**	**7.73**

Table 2: Tori distribution in male and female

Tori	Male (%)	Female (%)	Total (%)
Torus palatinus	18 (4.73)	19 (5.13)	37 (4.93)
Torus mandibularis	9 (2.36)	12 (3.24)	21 (2.8)
Total	**27 (7.1)**	**31 (8.37)**	**58 (7.73)**

Most patients located at 40-59 years age group and tori incidence decreased over the 60 years old. The prevalence in each age groups seen in table 3.

Table 3: Prevalence of TP and TM based on gender and age

Age groups (years)	Torus palatinus	Torus palatinus	Torus palatinus	Torus mandibularis	Torus mandibularis	Torus mandibularis
	Male (%)	Female (%)	Total (%)	Male (%)	Female (%)	Total (%)
20-29	3 (16.66)	3 (15.78)	6 (16.21)	1 (11.11)	2 (16.66)	3 (13.28)

Total	**18 (100)**	**19 (100)**	**37 (100)**	**9 (100)**	**12 (100)**	**21 (100)**

Discussion

Tori of maxilla and mandible were detected as bony outgrowths slowly is growing at palatal midline and mandibular lingual aspect[9,10]. A Jordanian study had been reported that no significant difference in the prevalence between male and female among Jordanian population 29.8% [11]. The racial divergence or ethnic groups may cause the tori prevalence varies among studies[12,13]. An Indian study showed torus prevalence being 9.5% in the palate and commonly occurred more in women in comparison to men[14]. Actually, no clear interpretation for such variance between sexes was identified, where genetics mightpropose being a fundamental contributing factor.

A significant finding of our study among this population was that TP (4.93 %) was more frequently seen than TM(2.8%).

Tori occurrence peak at third decade of life as mentioned by other observations[15,16], our investigation illustrate the occurrence peak for both tori at fifth decade of life. With age, tori prevalence starts to increase until reaching the peak at 40-49 years old. After that the occurrence of both tori trend to decrease over the 50 year old, this is agreed with the findings of many authors[16,17,18]. Functional factors affect this variation, after teeth extraction the torus palatinusregression noticed. Eggen and Natvig[19] showed same findings in Norwegians and summarized that prevalence decreased over the fifty years was attributed to remaining teeth numbers decrease, and also they associated the high TM prevalence with increasing the stress of mastication. Both tori was more common in female (8.37 %) as compared to male (7.1 %).

Conclusion

a. More occurrence of tori in female compared to male.

b. Both tori prevalence is low at such region, and prevalence of TP is higher than the prevalence of TM.

c. The incidence to tori increased with age up to 50 years old.

Abstract

Background: Depakine and epanutin are widely used in the treatment of a variety of diseases. A special attention should be given for their deleterious impacts on genetic material of patients.

Method: Sixty-five male albino mice were separated into four main sections. First is control injected with normal saline 1ml/kg, second section injected with depakine 25 & 50 mg/kg/day, third section injected with epanutin 3 & 6 mg/kg/day and fourth section injected with (depakine 25 + epanutin 3) & (depakine 50 + epanutin 6) mg/kg/day. Injections were via intraperitoneal, samples of both bone marrow erythrocytes for micronucleus test and hepatocytes for comet assay were collected after one and two weeks for each dose.

Conclusions: Human therapeutic doses range of depakine and/or epanutin generate (s) variable degrees of damages in genetic material in both bone marrow erythrocytes and hepatocytes of male albino mice depended on dose and time.

Keywords: *Epilepsy, liver, mutagenicity, phenytoin, sodium valproate.*

Introduction

Epilepsy is a prevalent long-lasting neurological illness symptomized by gratuitous muscular convulsions(1). It cannot be cured but it can be controlled by antiepileptic drugs(2). Antiepilepticdrugs have a wide range of clinical applications for the treatment of epilepsy and other disease(3). It was stated that there is a positive correlation between DNA damage and teratogenicity(4). Depakine (valproate sodium) has a broad capability to treat several types of epilepsy(5), psychiatricdisorders(6) and neuropathic spasm (7). Administration of valproate was associated with many delirious impacts. It was reported that in utero exposure to valproate induced high significant value of major congenital malformations in human embryo(8). According to several clinical reviews treatment with depakine during pregnancy resulted in fetal valproate syndrome symptomized with craniofacial deformities, growth delay, spina bifida, skeletal deformities and cognitive disorders(9). Epanutin (phenytoin sodium) applied to solve several clinical issues such as various degree of epilepsy, cardiac arrythmia and sensory-motor disorders(10). Phenytoin has adverse effects in pregnancy known as fetal hydantoin syndrome resembles to the fetal alcohol syndrome(11), characterized with craniofacial anomalies (broad nasal bridge, cleft lip and palate, smaller than normal head) and mental retardation(12).

Materials and Method

Present study was performed on December 2019 at university of Ain shams, collage of education, biological and geological science department, Cairo, Egypt.

Drugs: Depakine is produced by Sanofi Aventis in pharmaceutical form of sodium valproate 200mg/1ml oral solution.

Epanutin is produced by El Nile Pharmaceutical Company in the form of phenytoin 250mg/5ml vail for injection.All tested doses were prepared in constant volume of 1ml/kg body weigh by dissolving drugs in normal saline. Tested doses were equivalent to human therapeutic doses[13].

Animals and experimental design: Current experiment was carried out on pure and closed mating strain of male albino mice *Mus musculus* (CD -1). Animals were adult (6 to 8 weeks) with body weight (28 ± 2 g.) reared in animal house of Ain shams university, Egypt. Mice were resident in special acrylic boxes with base covered with clean wood shavings dust (3 mice per box) under constant temperature 20˚C and 12 hours of light/dark natural sequence for two weeks before the beginning of the experiment and during all procedures. Mice were supplied with typical murine pellets diet and deionized water. Sawdust was changed daily to avoid septic pollutants. Animals care, usage and experimental procedures were circumscribed with recommendations of Ain shams University ethics authorities. Sixty-five mice were randomly sectioned into seven groups (8 mice/group).

Control: Mice were injected daily with normal saline 1ml/kg.

Group 2: Mice were injected daily with depakine drug 25 mg/kg body wieght.

Group 3: Mice were injected daily with depakine drug 50 mg/kg body wieght.

Group 4: Mice were injected daily with epanutin drug 3 mg/kg body wieght.

Group 5: Mice were injected daily with epanutin drug 6 mg/kg body wieght.

Group 6: Injected daily with (depakine drug 25 + epanutin drug 3) mg/kg b.wt.

Group 7: Injected daily with (depakine drug 50 + epanutin drug 6) mg/kgb.wt.

All mice were injected intraperitoneally. Mice from all treated groups were randomly selected, sacrificed and specimens were taken after one and two week(s) for each dose.

Micronucleus (MN) test: Mice were injected with 0.05mg colchicine solution (2ml/1kg b.wt.) for 90-120 mins. Bone marrow was collected in fetal calf serum (media), smeared on clean microscope slide then stained by May-Grunwald 5-10 minutes[14]. Micronucleus test results represented by (mean ± SD) of polychromatic erythrocytes with micronucleus(MnPCEs) out of total scored 6000/group polychromatic erythrocytes (PCEs) and cytotoxicity results based on (mean ± SD) polychromatic erythrocytes (PCEs)/normochromatic erythrocytes (NCEs).

Comet Assay: It was applied on mice hepatocytes to spot and estimate DNA single-stranded breakages under cold, sterile, aseptic and UV free conditions to prevent DNA contaminations or damage. Hepatocytes isolated from homogenized liver by hepatocytes lysis media (1:1 by volume) and centrifuge (1500r.p.m.) for 30min. One drop of the mixture consisted of [20 µl of hepatocyte + 60 µl of low melting point agarose (0.5% phosphate buffer solution)] was smeared on clean microscopic slide pre-coated with dried normal melting point agarose (0.75% phosphate buffer solution) left to harden at 4°C, final layer of normal melting point agarose was applied, slides were immersed gently in a cold lysis liquid thenelectrophorized by 0.74 Volt/ centimeter and 300 milli ampere for 30 minutes where DNA fragments migrate toward anode[15]. Slides were immediately stained in dim light by ethidium bromide and comets were evaluated by adjusted filter 515-560 nm of fluorescent microscope.

Statistical Analysis: Data were processed by version 16.0 of (SPSS). Results are determined by means ± SD of three independent repetitions. T- test was applied to evaluate statistical significance of varianceat $P < 0.05$ level as statistically significant.

Results

Micronucleus Test: Under microscope two distinguishable colored stages of erythrocytes were identified. Figure 1 displayed that polychromatic erythrocytes (PCEs) were immature erythrocytes contain variable amounts of chromatin material so, it

was stained in blue-grayish,some of (PCEs) contain a condensed chromatin appeared in the form of dark blue spot known as micronucleus and it considered as pathogen (MnPCEs) andnormochromatic erythrocytes (NCEs) were mature erythrocytes had no chromatin stained in pinky-yellowish. As shown in table 1 the mean of (MnPCEs) and the mean of (PCEs/NCEs) displayed variable degrees in the significant values. The means of (MnPCEs) were increased while the means of (PCEs/ MnPCEs) were decreased (cytotoxicity increased) by dose and time in all treated groups in comparison to control group.

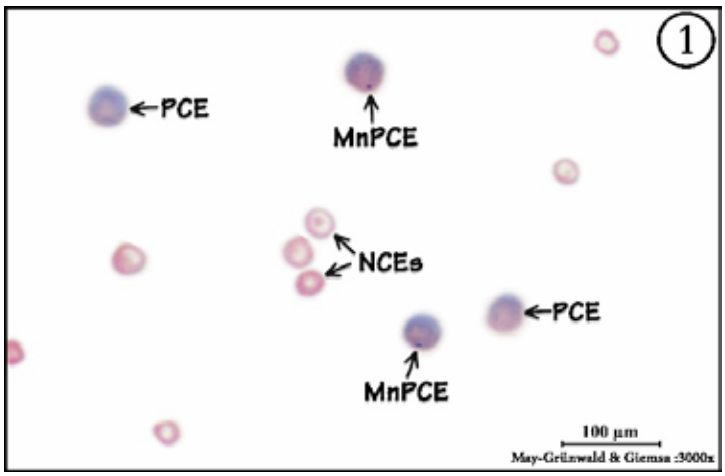

Figure1: Photomicrograph of bone marrow smear of male albino mouse *Mus musculus* treated with single dose of epanutin (6 mg/kg b.wt.) for two weeks showing polychromatic erythrocytes (PCEs), normochromatic erythrocytes (NCEs) and Polychromic erythrocytes with micronucleus (MnPCEs).

Table 1: The (Mean ± SD) of both polychromatic erythrocytes with micronucleus (MnPCEs) and polychromatic erythrocytes (PCEs)/normochromatic erythrocytes (NCEs) in bone marrow of male albino mice of control and all treated groups.

Drug	Dose mg/kg	PCEs/mouse	Micronucleus		Cytotoxicity	
			MnPCEs		PCEs/NCEs	
			1st week	2nd week	1st week	2nd week
Control		6000/3	12.7±1.3	12.7±1.3	2.1	2.1
Depakine	25	6000/3	14.0±0.8	19.7±1.7*	1.9*	1.8**
	50	6000/3	24.0±0.8**	33.0±2.5**	1.8*	1.7**

* represented high significant value (P<0.01), ** represented significant value (P<0.05)

Comet Assay: According to tail length 3 classes of nuclei were figured out. Class 0 had no tail; class 1 tail is shorter than the diameter of nucleus and class 2 tail length 1 to 2x the diameter of the nuclei as shown in figure 2. Hepatocytes with no heads were omitted from the calculation because they represented dead cells. Total comet score results were expressed by (mean ± SD) of (number of comets multiplied by class number) out of total scored 300 randomly selected and non-overlapping hepatocytes nuclei/group. Statistical analysis was summarized in table 2, it exhibited high significant increase (P<0.01) in the mean of total comet score in most of treated groups in comparison to control group depend on dose and time.

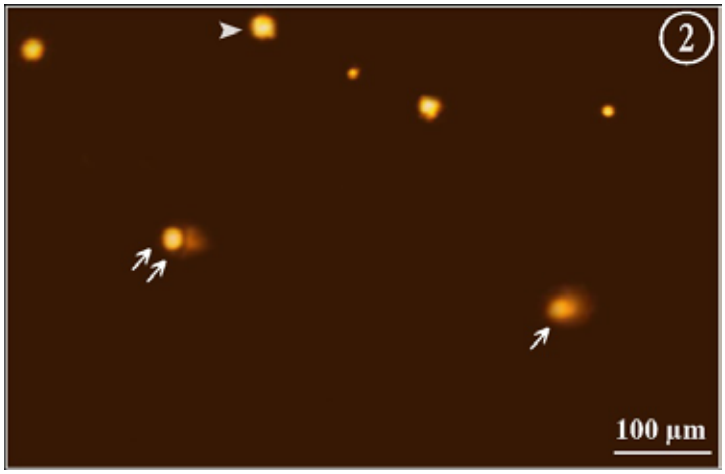

Figure 2: photomicrograph of comet-FISH product of hepatocytes nuclei of male albino mouse *Mus musculus* treated with single dose of epanutin (6 mg/kg b.wt.) for two weeks showing comet class 0 (arrow head), comet class 1 (single arrow) and comet class 2 (duple arrows).

Discussion

Current investigation declared that treatment of depakine and/or epanutinresulted in significant increase in the mean of micronuclei formation in bone marrow erythrocytes of male albino mice depend on dose and time. Our results was supported by previous publications found that micronuclei formation was enhanced in erythrocytes of mice and rat after the treatment with depakine [16], or was enhanced in reticulocytes of male mice after the treatment with phenytoin [17] or was enhanced in human umbilical blood cells *in vivo* after the treatment with depakine together with epanutin [18]. These findings explanations were in the light of micronuclei are chromosomal residual after improper cellular division[19] produced as a result of chromosomal aberrations caused by the treatment of either depakine[20] or epanutin [21]. Also, treatment of depakine and/or epanutin resulted in significant increase in the mean of cytotoxic impacts in bone marrow erythrocytes of male albino mice depend on dose and time. It was proved that cytotoxicity in rat hepatocytes was generated either by depakine treatment represented by enzymatic leakage in rat hepatocytes *in vitro* depended on dose [22] or by epanutin treatment represented by collapsing of mitochondrial membrane and kreb's cycle dysfunction [23]. Cytotoxicity results were due to the arrest of erythroblasts maturation (early stage of PCE) by depakine treatment *in vitro* [24]or even by epanutin treatment in human[25] and this maturation arresting resulted in decreased the number of PCE

(numerator) of the PCEs/NCEs ratio. Results found that treatment with depakine and/or epanutin resulted in raising the mean of total comet score by dose and by the time in compression to control group. According to earlier studies DNA fragmentation could be induced in human after depakine treatment [26]and in mice fetus cell culture pretreated with epanutin [27].In the present work variable degrees of significance among all treated groups were due to the difference in the depakine and/ or epanutin mechanisms of action. Genotoxicity and cytotoxicity were induced as a result of oxidative stress [28]induced either by depakine administration[29] or by epanutin administration[30] in addition to folate deficiency [31]caused by epanutin treatment [32].Results of groups that were co-treated with depakine together with epanutin could be described due to depakine repel epanutin from plasma [33].

Conclusion

Treatment with human therapeutic doses range of depakine drug and/or epanutin drug generated genotoxic impacts in bone marrow erythrocytes and hepatocytes in adition to induction of cytotoxic effects in bone marrow erythrocytes in male albino mice. These drugs should be administrated under restricted medical consideration to avoid the incidance of mutagenicity in human patient.

Assessment of Neutrophil-to-Lymphocyte Ratio, Platelet-to-Lymphocyte Ratio,Oxidative Stress and Anti Oxidants levels in Polycystic Ovary Syndrome Patients with Low-Grade Chronic Inflammation

Najlaa Abdulameer Ali AL-Dahhan[1], Aseel Jassim Albdairi[2], Ammar Jabbar Hamad[3]

[1]Assist. Prof., Department of Basic Science, College of Dentistry, University of Kufa, Al-Najaf, Iraq, [2]Assist. Prof., Department of Physiology, College of Medicine, University of Kufa, Al-Najaf, Iraq, [3]Assist. Prof.,Department of Medicine, College of Medicine, University of Kufa, Al-Najaf, Iraq

Abstract

Background: The ratio of neutrophils to lymphocytes (NLR) and the ratio of platelets to lymphocytes (PLR)are prognostic factors in many diseases such as inflammatory diseases, cardiovascular diseases and cancer. However, racing NLR and PLR are important, it is important to establish reference values for NLR and PLR in polycystic ovary syndrome (PCOS) patients with mild chronic inflammation.

Objective: To determine the neutrophil-lymphocyte *ratio* (NLR)and platelet-lymphocyte *ratio* (PLR), and the relationship between *oxidative stress* markers *and anti oxidants* markers in PCOS patients *with low-grade chronic Inflammation*. Methodology. The study included 92 patients with PCOS and 46 control. Serum PON1, XO, SOD activities, 8-OHdG and NO levels were measured using enzyme linked immunosorbent assay (ELISA) kits.

Results: Concentration of TNF-α, IL-6, IL-8, IL-10 and CRP were significantly higher in PCOS patients compared with control (P<0.001). Significant increases were recorded in WBC, ANC, PLT, NLR, PLR, and ESR values. A significant decrease in ALC and MPV values in PCOS patients compared with control (P<0.01). Serum XO, SOD activities and NOlevels were higher in PCOS patients than in the control (p<0.001). Serum 8-OHdG levels and PON1 activities were lower in PCOS patients than in the control (p<0.001). Serum CRP values is positively correlated with XO, NO, 8-OHdG and PON1 activity (r=0.377, p<0.008; r=0.560, p<0.007; r=0.387, p<0.006; r=0.481, p<0.009), respectively. Serum CRP values is negatively correlated with SOD activity in PCOS patients (r=−0.444, p<0.004).Serum XO activities were negatively correlated with serum PON1 and SOD. Serum XO activities were Positively correlated with serum NO and 8-OHdG levels.

Conclusion: Inflammation stimulates the oxidation process and reduces the ability of cellular antioxidants in PCOS patients. NLR and PLR are good markers of inflammation, their highest values indicate the severity of the disease and an imbalance between neutrophils and lymphocytes can be linked to cancer and its development.

Introduction

Polycystic ovary syndrome (PCOS) is a common disorder in women of childbearing years characterized by increased androgen and ovulation and is associated with many metabolic disorders, especially insulin

resistance and obesity [1] . Oxidativestress (OS) indicates an imbalance between oxidizing substances and antioxidants that lead to abnormal cell state [2] . OS occurs when destructive reactive oxygen species (ROS) overcome antioxidants,and stress leads to the accumulation of peroxides and free radicals causing damage to DNA and/orprogrammed cell death and causing damage to proteins,lipids,carbohydrates and other molecules [3] . Chronic inflammation and ROS contribute to the DNA damage of many organs, and ROS causes oxidation of biomolecules such as lipids,proteins,and other molecules which leads to the formation of toxic and mutagenic intermediates [4] .Cells produce ROS and reactive nitrogen species (RNS) as normal products of the biological reduction of molecular oxygen. ROS include superoxide anion ($O2^{\bullet-}$), hydroxyl radical ($OH^{\bullet}$), hydrogen peroxide (H2O2) and organic peroxides [5,6] . Superoxide ($O2^{\bullet-}$) is mainly generated at the mitochondrial electron transport chain level and canbe converted to hydrogen peroxide (H2O2) by SODorundergospontaneous disassociation [6] . RNS includes nitric oxide (NO) and its metabolites, which are also highly reactive and toxic [1,5]. Inflammation is one of the main pathophysiological factors in PCOS diseases. Nowadays diagnostic and monitoring markers are used, such as C-reactiveprotein (CRP), erythrocyte sedimentation rate, ferritin, serumalbumin, apolipoprotein A-1, tumor necrosis factor, interleukin-1, interleukin-6 and others [7,8] .Chronic inflammation and infection are an important and major cause of cancer,include NF-κB,reactive oxygen species and nitrogen, inflammatory cytokines,prostaglandins,andR NAs,through proliferation changes,cell death,cellular aging,mutation and methylation in DNA [7] .

Several biomarkers such as CRP, neutrophil-to-lymphocyteratio (NLR) and platelet-to lymphocyte ratio (PLR) were used as markers of inflammation and endothelial damage [8,9] .Complete blood count (CBC) test is widely used,and mainly includes white blood cell (WBC) count, red blood cell (RBC) count and platelet count.WBCs most abundant in healthy individuals are neutrophils,which play important roles during acute and chronic inflammation and may be potential therapeutic targets in several diseases [10,11].

8-Hydroxydeoxyguanosine (8-OHdG) can be a defense mechanism against oxidative stress and preventing inflammatory disease [12]. ROS easily attacks guanine bases in DNA and forms 8-OHdG, which can bind to thymidine instead of cytosine, so the 8-OHdG level is a biological biomarker of mutations resulting from oxidative stress. The oxidative form of DNA damage can be seen by assessing the concentration of 8-OHdG (13) .8-OHdG can reduce ROS production, reduce the pathway of nuclear factor-κB,and reduce expression of inflammatorymediators such as interleukin IL-1,IL-6,cyclo-oxygenase-2,and inducible nitric oxide synthase in addition to the expression of nicotinamide adenine dinucleotide phosphate oxidase (NOX) -1,NOX organizer-1and NOX activator-1 in different cases of PCOS inflammation [2] .To determine the role of OS in PCOS, a set of vital biomarkers were examined including Xanthine oxidase (XO),NO,8-OHdG, Paraoxonase1 (PON1) and Superoxide disututase (SOD) . The aim of present study was to verify individual and group diagnostic accuracy of NLR,PLR,and MPVin PCOS patients diagnosed with CRC. And assess whether there was any relationship between oxidative stress markers and antioxidant markers with inflammation in the development of PCOS.We have investigated oxidative stress by measuring serum XO activity (as a generator of reactive oxygen species) and NO levels.

Material and Method

Study Population: One hundred and thirty-eight women within the (21-38) age group were involved in this study from 12 October 2018 to 16 November 2019. They were divided into two groups:92 patients with PCOS (mean age:34.4±5.8years)and 46 healthy individuals were recruited as a controls (mean age:35.7±5.8years). Patients selected clinically diagnosed with polycystic ovary syndrome fromAl-Saddr Teaching Hospital in Najaf city,Iraq. The diagnosis was based on the presence ofoligomenorrhea or chronic menopause (less than six menstrual periods in the preceding year), hirsutism (Ferriman-Gallweyscore of7),LH/FSH ratio (3.0),hyperandrogenemia, plasma total testosterone concentrations of more than (0.6)ng/ml,and free androgen index (FAI)of less than 5.Patients were excluded if they had evidence of the presence history of malignancy,hype rprolactinemia,diabetes mellitus,hypertension,pregnanc y,thyroid and adrenal dysfunction,any history of cardiac symptoms, myocardial infarction,angina,coronary arterydisease,vascular disease.Womenwho are taking contraceptives because they contain hormones,acetyl salicylic acid,non-steroidal anti-inflammatory drugs or other pharmacological factors that could affect On the results of our study.

Sample Collection: Blood samples were collected

after an overnight fasting of ≥12 hours on the second or third day of the menstrual cycle. Venous blood samples (5ml)were collected into EDTA tubes and centrifuged at 3000 rpm for 5 minutes, and, were separated and stored at -20ºC for estimate some criteria.

Method:On the second or third day of the menstrual cycle, the BMI was calculated according toWHOcriteria based on weight divided by height squared (kg/m^2).Using commercially available diagnostic kits (Bayer Corporation, Tarrytown, NY) in an Advia Centaur Immunoassay System, Follicle stimulating hormone (FSH), lutenizing hormone (LH), and prolactin (PRL)levels were measured. SerumCRP was turbidimetricallydetermined by aclinical chemistrysystem (SPACE, Schiapparelli Biosystems, Woerden, The Netherlands), which gives a quantitative result.SerumC-reactive protein (CRP), tumor necrosisfactor-a (TNF-a), interleukin-6 (IL-6), interleukin-8 (IL-8), andinterleukin-10 (IL-10)were determined using ELISAkits (SunLong Biotech Co, China).Serum PON1, XO, SODactivities, 8-OHdG and NO levels were measured using enzyme linked immuno sorbent assay (ELISA)kits (SunLongBiotechCo, China). Complete blood counts (CBC)tests were performed in anticoagulant samples with EDTA within 4hours after collection, using a Coulter®LH750Hematology Analyzer (Beckman Coulter, USA). Neutrophil-to-lymphocyteratio (NLR) was calculated by dividing the absolute neutrophil count (ANC) by the absolute lymphocyte count (ALC); likewise, platelet to lymphocyte ratio (PLR) was calculated by dividing the absolute platelet count by Absolute lymphocyte count (ALC). Three levels of commercial surveillance material (Beckman Coulter, USA) were run twice daily. Samples were excluded with white blood count (WBC)less than 3.5×10^9/Lor more than 9.5×10^9/Land platelet less than 125×10^9/Lor more than 350×10^9/L.

Statistical Analysis: SPSS software 22 was used for statistically analysis. The data are expressed as mean±SD. Significance of the difference between the mean value of the measured parameters between groups were evaluated by Student's t-test. and chi-square. Correlation was indicated by Pearson correlation tests and P<0.05 is consider significant.

Results

The demographic characteristics and hormones levels in PCOS patients and control are shown in Table 1. Concentration of pro-inflammatory cytokines (TNF-a, IL-6and IL-8), anti-inflammatory cytokines (IL-10), and CRP were significantly higher in PCOS patients compared with control (P<0.001) Table 2. A significant increases in WBC, ANC, PLT, NLR, PLR and ESR values in PCOS patients compared to controls.A significant decrease in ALC and MPV values in PCOS patients compared with control (P<0.01) Table 3 and Fig.1. Serum XO, SOD activities and NOlevels were higher in the PCOS patients compared with control (p<0.001). Serum 8-OHdG levels and PON1 activities were lower in women with PCOS than in the control (p<0.001)Table 4. Serum CRP values is positively correlated with XO, NO, 8-OHdG and PON1 activity (r=0.377, p<0.008; r=0.560, p<0.007; r=0.387, p<0.006; r=0.481, p<0.009), respectively. Serum CRP values is negatively correlated with SOD activity in PCOS patients (r=−0.444, p<0.004) Table 5. SerumXO activities were negatively correlated with serum PON1 and SOD activities (r=−0.465, p<0.008; r=−0.375, p<0.007), respectively. Serum XO activities were Positively correlated with serum NO and 8-OhdG levels (r=0.483, p<0.009; r=0.472, p<0.006), respectively Table 6.

Table 1. Characteristics in PCOS patients and control.

Parameter	PCOS (n=92) Mean ± SD	Controls (n=46) Mean ± SD	*p*-Value
Age (Years)	23.40±2.80	24.72±1.68	NR
BMI (kg/m^2)	29.33±3.56	22.48±2.87	<0.01*
FSH (mIU/ml)	5.22±2.20	6.10±2.11	<0.001
LH (mIU/ml)	10.33±2.11	5.01±2.77	<0.001
PRL (mIU/ml)	40.42±1.28	18.88±1.18	<0.001

*p<0.05 was considered significant; NR,Not significant.

Table 2. Concentration of pro-inflammatory cytokines, anti-inflammatory cytokinesand CRP in PCOS patients and control.

p-Value	Control (n=46) Mean ± SD	PCOS (n=92) Mean ± SD	Parameter
< 0.001	8.11±2.21	43.30±3.42	CRP (mg/l)
< 0.001	5.42 ± 1.66	97.33 ± 1.74	TNF-a(pg/ml)
< 0.001	38.32±6.32	142.31±5.24	IL-6 (pg/ml)
< 0.001	31.34±5.95	127.44±7.10	IL-8 (pg/ml)
< 0.001	40.14±2.27	77.62±2.22	IL-10 (pg/ml)

CRP, C-reactive protein; TNF-α, tumor necrosis factor-α; IL-6,interleukin-6; IL-8, interleukin-8.p<0.05 was considered significant

Table 3. Laboratory values in PCOS patients and control.

p-Value	Controls (n=46) Mean ± SD	PCOS (n=92) Mean ± SD	Parameter
<0.01	4.55±7.33	12.02±4.31	WBC(10^9/L)
<0.01	4.33 ± 1.62	7.55 ± 2.66	ANC (%)

<0.01	15.86±4.76	31.11±8.21	ESR(mm/hour)

p<0.05 was considered significant; WBC, white blood count. Tumor necrosis factor-alphaCBC,Complete blood counts;ANC,Absolute neutrophil count; ALC,Absolute lymphocyte count.

Table 4. Serum oxidative stress markers (XO, NO and 8-OHdG) and antioxidative stress markers (SOD and PON1) in PCOS patients and control.

p-Value	Controls (n=46) Mean ± SD	PCOS (n=92) Mean ± SD	Parameter
< 0.001	0.73±0.30	4.07±0.22	XO (U/mL)
< 0.001	6.82±3.11	10.06±2.52	NO (µmol/L)
< 0.001	220.32 ± 64.81	136.72 ± 45.34	8-OHdG (pg/mL)
< 0.001	748.66±20.77	855.44±41.44	SOD (U/gm of Hb)
< 0.001	196.10±81.83	127.50±77.26	PON1 (U/L)

p<0.05 was considered significant

Table 5. Correlation between Oxidative stress markers, Antioxidative stress markers and CRP in PCOS patients.

Parameter	PCOS (n=92)		Control (n=46)	
	r	p-value	r	p-value
XO (U/mL)	0.377	<0.008	0.228	<0.005
NO (µmol/L)	0.560	<0.007	0.217	<0.008
8-OHdG (pg/mL)	0.387	<0.006	0.636	<0.005
SOD (U/gm of Hb)	−0.444	<0.006	0.338	<0.002
PON-1 (U/L)	0.481	<0.009	0.568	<0.007

Table 6. Correlation between XO activity and PON1, SOD activity, and NO, 8-OHdG levels in PCOS patients.

Parameter				p-value
8-OHdG (pg/mL)	NO (μmol/L)	SOD (U/gm of Hb)	PON1 (U/L)	
0.472	0.483	−0.375	−0.465	r
<0.006	<0.009	<0.007	<0.008	

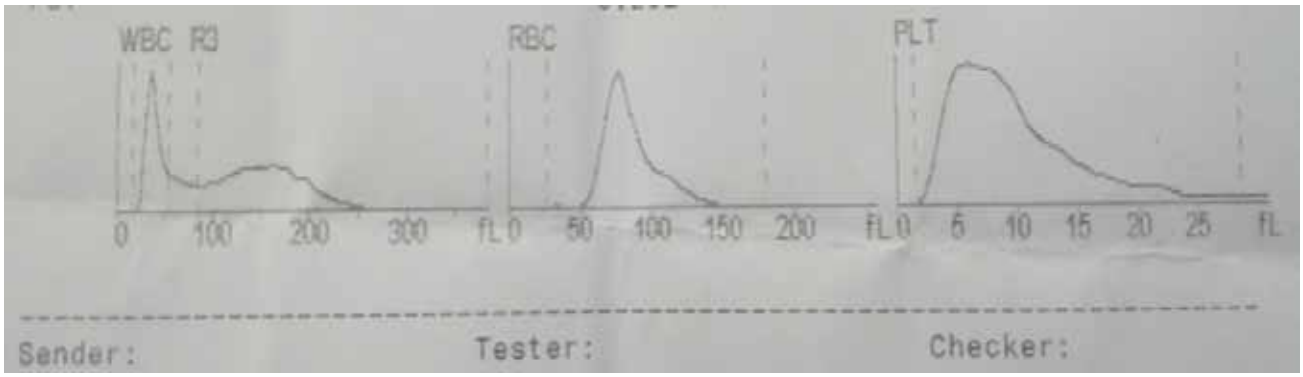

Fig. 1. Values of WBC, RBC and PLT in PCOS patients

Discussion

Enlarged adipose tissue leads to infiltration of macrophages and imbalance are pro-inflammatory and anti-inflammatory factors secreted by adipose tissue, which leads to enhanced inflammation, impairment of insulin sensitivity and dysregulation of lipid metabolism. Obesity-related inflammation is caused by extra nutrients that initially activate many pathways of metabolic signals, such as JNK, NF-kB, and protein kinase R pathways [2, 14].In obese PCOS patients, BMI, free fatty acids, IL-6, and CRPlevels increased, while androgen levels decreases with gonadotropin-releasing hormone (Gn RH) agonist for a long term [15]. These results are consistent with Our current study. Activation of these pathways leads to the production of many inflammatory cytokines and then leads to chronic low grade inflammation [6]. Increased production of ROSleads to disruption of the organism, therefore, the enhancement of OS in tissues and organisms causes related damage;harms mitochondrial components (mtDNA, proteins, lipids, etc.), and induces apoptosis [1]. Our results indicate the concentration of pro-inflammatory cytokines (TNF-α, IL-6 and IL-8), anti-inflammatory cytokines (IL-10), and CRP were significantly higher in PCOS patients compared with control (P< 0.001, foreach) Table 2. Several recent studies have indicated that chronic inflammation have a role in causing PCOS because many markers of inflammation are elevated in those women with this disease. On the other hand, a relationship was found between the proinflammatory condition and PCOS, associated with polymorphism of TNF-α, IL-6, and its receptor[16,17]. Inflammation are involved in the pathogenesis of numerous chronic diseases. Where there is a relationship between chronic low-grade Inflammation and the development of PCOS [4].

Our results indicate a significant increases in WBC, ANC, PLT, NLR, PLR and ESR values, and a significant decrease in ALC and MPV values in PCOS patients compared with control (P<0.01, for each) Table 3 and Fig. 1. These results are consistent with other studies [9, 18]. NLR (neutrophil-to-lymphocyte ratio)and PLR (platelet to lymphocyte ratio) were good inflammatory markers and can be used to assess disease activity and in some diseases they are used to differentiate infections [16]. On the other hand, these parameters are related to the early diagnosis of diseases[11]. MPV is used as a marker for platelet size and activity [10]. MPV has been identified as an inflammatory marker for cerebrovascular, cardiovascular, digestive and rheumatic diseases [18]. Also, as a marker of early diagnosis in detecting types of cancer [9, 10]. Ahigh BMI can be explained by considering that obesity can also affect MPV [19].

Oxidants and antioxidants are involved in regulating gene expression in physiological and pathological

conditions, and therefore ROS modulate proliferation (1). The results indicated a significantly increased Serum XO activity in women with PCOS compared with control (p<0.001). Table 4. XO plays an important role in the catabolism of purines and generating ROS in PCOS patients [20], Thus it can be said that the increase is due to the increase in oxidative stress in patients. These results are consistent with previous studies[20, 21]. PCOS can be considered a purely oxidative state in which the body's antioxidants cannot exceed the overproduction of free radicals [3]. This indicates that the increase in XO activity is closely related to the changes and increase in markers of inflammation during the development of PCOS.XO is a key enzyme and source of ROS and can generate superoxide anion radicals, capable of lipid peroxide and protein degradation[21]. This enzyme catalyzes oxidation of hypoxanthine to xanthine and oxidation of xanthine to uric acid [20]. Free radicals seek stability by taking electrons from other stable molecules, which creates a chain reaction of free radical formation that can cause damage to body cells, proteins, and DNA. In addition, aging and/or environmental stressmay enhance this oxidation and may cause chronic inflammation, which may exacerbate damage and increase the risk of cancer. NO plays a major role in the pathophysiology of PCOS. The results showed that NO levels were statistically higher in patients with PCOS compared to control (p<0.001) Table 4. RNS, uch as NO with the unpaired electron are also highly reactive and toxic.OS occurs when destructive ROS overcome antioxidants, causing DNA damage and/or programmed cell death. Our current results are consistent with similar studies [6, 22]. Increased NO levels may be toxic to host cells, as they are also produced in immune responses by monocytes, macrophages, and neutrophils[6, 23], indicated that nitrite/ nitrate concentration is an indicator of NOlining. On the other hand, an analytical study showed that the mean NO level had no statistically significant difference in patients with PCOS compared to controls [24].Moreover, several data indicated a significant negative correlation between NO and fasting insulin levels and HOMAin PCOS patients [2].

Serum8-OHdG levels was decrease in PCOS patients compared with control (p<0.001)Table 4. The reason for the decrease in 8-OHdG level may be due to changes in antioxidant levels as response to increased oxidative stress that causes DNA damage these results are consistent with previous studies [25, 26], which have indicated that metformin therapy leads to reduced serum 8-OHdG level in obese patients.On the other hand, 8-OHdG levels are associated with body weight and the marker of inflammation CRP [13].Conversely, several studies indicated an increase in the 8-OHdG level in PCOS patients compared to control [27, 28]. On the other hand, Several studies have shown increased levels of 8-OHdG in diseases associated with oxidation. ROS easily attacks guanine bases in DNA and forms 8-OHdG, which can bind to thymidine instead of cytosine, so the 8-OHdG level is a biological biomarker of mutations resulting from oxidative stress [12]. The oxidative form of DNA damage can be seen by assessing the concentration of 8-OHdG [13].

SODs are a family of enzymes that catalyze the breakdown of $O2^{-}$ to H2O2, which is a toxic substance converted to water by GPx [29, 30].Serum SOD activity increased in patients with PCOS compared to control (p<0.001) Table 4. These results are consistent with other studies [22, 31, 2]. Excessive expression of SODmay be an adaptive response against increased ROS levels, and leads to increased dissociation of superoxide from hydrogen peroxide [33].Several studies have suggested that an increase in antioxidant enzymes may represent compensatory swelling in response to an increase in oxidative stress [34, 35]. Serum SOD activity can be a clinical marke for determining oxidative stress in PCOS patients. SODenzymes act as pro-oxidant producing H2O2;for this reason, other antioxidant enzymes such as GPXand CAT are urgently needed. On the other hand, the results of our study are not compatible with what previous studies have found[21, 36].

PON1 is an antioxidant responsible for removing oxidized toxins from lipids[37]. Serum PON1 activity decreased in PCOS patients compared to control (p<0.001) Table 4. Similar results have been reported in other studies[20, 38]. The mechanism of decrease serum PON1 activity is unclear. Consumption of PON1 to prevent oxidation can lead to decreased activity in PCOS patients, or the reason for the decrease is due to the increased disruption of PON1 as a result of increased ROS generation in patients[38]. Therefore, it can be speculated that the superoxide anions produced by XO are responsible for the decreased PON1 activity due to the change in structure of protein. PON1 associated with lipid peroxidation, therefore an anti-inflammatory indication due to its activity in paroxonase which does not represent its total physiological activity. PON1/ HDL activity was a better abnormal parameter in several diseases including PCOS [20].

Serum CRPvalues is positively correlated with XO, NO, 8-OHdG and PON1activity (r=0.377, p<0.008; r=0.560, p<0.007; r=0.387, p<0.006; r=0.481, p<0.009; respectively). Serum CRP values is negatively correlated with SODactivity in PCOSpatients (r=−0.444, p<0.006) Table 5. These results are consistent with other studies [20, 21]. OS and chronic inflammation are closely related mechanisms, the release of many active substances by inflammatory cells into inflammatory sites results in the overgeneration of the OS [39]. This relationship is confirmed by the increase in the levels of associated circulatory markers with inflammation, such as CRP, IL-6, TNF-α, IL-8, monocyte chemoattractant protein-1 (MCP-1), soluble intercellular adhesion molecule-1, and WBC in PCOS patients[16, 39]. XO was used as an indicator of oxidative stress (as agenerator of ROS); Serum XO activities were negatively correlated with serum PON1 and SOD activities (r=−0.465, p<0.008; r=−0.375, p<0.007; respectively).SerumXO activities were positively correlated with serumNO and8-OHdG levels (r=0.483, p<0.009; r=0.472, p<0.007; respectively)Table 6. These results are consistent with other studies[2, 20]. To our knowledge, this is the first study that combines NLR, PLR and MPV and has a high diagnostic accuracy. In addition, this is the first study among the Iraqi population, which is important given the regional prevalence of PCOS. **In conclusion**. An imbalance in oxidative stress and antioxidants system toward increased of ROS generation and cause PCOS and its development. Inflammation stimulates the oxidation process and reduces the ability of cellular antioxidants in PCOS patients. Diagnostic effectiveness of NLR, PLR, and MPV can be used as biomarkers and test markers to detect PCOS even in the early stages of the disease, taking into account that it is part of a routine blood work analysis, and its higher values disease severity and imbalance between neutrophils and lymphocytes then to cancer and its development.

Impact of Breakfast Habits on Physical Parameters and Academic Performance of Nursing Students

Nalini M.[1], Sukesh[2], Joyce Fernandes[3]

[1]Head of the Department, Mental Health Nursing, Nitte Usha Institute of Nursing Sciences, [2]Assistant Professor, Department of Mental Health Nursing, Nitte Usha Institute of Nursing Sciences, [3]Lecturer, Department of Mental Health Nursing, Nitte Usha Institute of Nursing Sciences

Abstract

Background: Breakfast is an important meal of the day. Skipping Breakfast has become very prevalent among health science university students. Therefore, the present study was conducted to find the impact breakfast habits on the Body Mass Index (BMI), Haemoglobin and Academic performance.

Methodology: Eighty-one, first year undergraduate nursing students from the Nitte (deemed to be University), were taken for the study, after taking informed consent from them. Purposive sampling Technique was used to select the students. Students Breakfast habits were assessed by questionnaires, and haemoglobin (Hb) level was by lab investigation. Standard instruments were used to check the height and weight of the students.

Results: Revealed that the majority of the students (55.6%) skipped Breakfast. Also, the majority of them mentioned the reason for skipping Breakfast is lack of time, getting up late, not hungry, not interested in having Breakfast, and tasteless food. Beside, there was no significant difference found between BMI, Hb, and Academic Score in breakfast-skippers and non-skippers. Though the present study hasn't shown any impact of breakfast habits on physical parameters and academic performance, it may affect on total nutritional status of the students. So it's need of the hour to aware the students on the importance of regular Breakfast.

Keywords: *Breakfast habits, BMI, Haemoglobin, Nursing Students, Academic Performance.*

Introduction

Adolescence is a crucial period, where rapid growth and development takes place. Having a regular and balanced diet in this period will ensure healthy development[1].Breakfast is important meal of the day. Regular consumption of Breakfast is a part of a healthy lifestyle. It should contribute around 20 to 30 percent of daily total energy needs[2,3]. Studies revealed that eating healthy breakfast results in a total positive nutritional outcome of children[4].Also, Breakfast with an adequate level of tryptophan will help to gain beneficial effects on mental health. The mechanism of action is the conversion of tryptophan into serotonin in the day time, which is a natural antidepressant and serotonin to melatonin at night induces good sleep[5]. Thus, it may positively affect the mental health, cognitive functions, and academics of young people[3]. On the Contrary, skipping Breakfast is associated with mood disorders, cognitive impairment, overweight and obesity, and health risk behaviours such as smoking, bullying.[6–8]

Despite the known effect of Breakfast on physical and mental health, skipping Breakfast become prevalent

among adolescence[6,9]. A systematic review conducted showed that Breakfast is frequently skipped meal compared to other meals, with the prevalence ranging from 5% to 83%[10]. Besides newspaper article in the new Indian express revealed that three out of four does not eat healthy Breakfast, and one out of four skip breakfast in India[11]. Also, to support this, studies conducted in India revealed, breakfast skipping habits among school-going adolescents ranged from 30-50%[12].

The prevalence rate is even high among Health science University students. The study conducted in Malaysian Health Science University revealed that the majority of students consume Breakfast between one to three times per week [13]. The data from the Saudi Arabian College of Health Sciences showed, 38.7% of the students eat Breakfast three to four times a week and daily by 49.9% [14]. Also, a study from Ghana revealed that 72% of Medical students skip the meal [15]. The research conducted in Iran told that 71% of nursing students skip Breakfast [16]. Beside a study conducted in Haryana, India showed 78.2% of B.Sc Nursing students skip a meal [17]. The reason given towards skipping Breakfast was to lose weight, no time, waking up late, not having Breakfast to eat, and not hungry [13].

As from the above review, it is clear that breakfast skipping habits are prevalent among health science university students. Also, these reviews have shown that it has a deleterious effect on cognitive functions; thus, it may lead to poor academic performance. As there are very few studies in the field of Nursing concerning breakfast habits, the present study is done to know the prevalence of Breakfast skipping among first-year nursing students and its effect on academic performance, BMI, and Hb level.

Method

A descriptive cross-sectional study was conducted to assess the breakfast habits and its impact on academic performance, BMI, and Hb level. After taking the informed consent total of of 81 students of First Year B.Sc. Nursing was taken for the study. Purposive sampling technique was used to select the above students.

Data Collection Instruments: Initially, demographic characteristics of the participants such as age, gender, type of family, Residence, attendance, academic grade, diet preference, Hight and weight, frequency of having Breakfast per week were collected. Followed by reasons for skipping the Breakfast were assessed by checklist, which had 11 items. Five ml of blood was collected to determine the Haemoglobin level of students. Lab investigation was done at Justice K.S Hegde Hospital, Mangaluru. BMI was calculated by dividing weight in kg by the height in meters square. Classification of the BMI was made as per the WHO guidelines.

Statistical Analysis: Collected data were analyzed using SPSS software 22 version. Descriptive statistics such as frequency and the percentage was used to explain the demographic characteristics and to assess the reason for skipping Breakfast. An independent sample t-test was used to find the difference in the BMI, Hb, and academic marks of breakfast-skippers and non-skippers. P-value is< 0.05 level is considered significant.

Result

Socio-Demographic Characteristics: In the present study, among 81 students, the majority of them were females (77%) belongs to the age group 17 to 19 (77%). Most of them from the nuclear family (77%) and stays in the Hostel (74%). The majority of them were having a normal BMI range (63%) and Hb level (81%).

Table 1: Reason for skipping Breakfast (n=81)

Reason for skipping Breakfast	Frequency	Percentage
Lack of time	67	82.71
Anxiety	10	12.34
Nauseated	7	8.64
Getting up late	47	58.02
Not hungry	46	56.79
Food allergy	2	2.46
No interest	27	33.33
Over weight	7	8.64
Tasteless Food	47	58.02
Fasting	9	11.11

Among 81 students, the majority of them said the reason for skipping Breakfast is lack of time (82.71%), getting up late(58.02%), not hungry (56.79%), not interested in having Breakfast (33.33%), and tasteless food (58.02%). (Table 1).

Table 2: Difference in Hb level, BMI and Academic Marks of Breakfast skippers and Non-Skippers (n=81)

		N	Mean	Std. Deviation	Mean Difference	df	T value	Sig. (p-Value)	Std. Error Difference
Hb	Non Skippers	36	13.044	1.6263	-.0022	79	-.006	.995	.3763
	Skippers	45	13.047	1.7267					
BMI	Non Skippers	36	20.786	2.9076	.7196	79	1.063	.291	.6771
	Skippers	45	20.066	3.1203					
Academic Marks	Non Skippers	36	61.11	12.723	3.133	79	1.181	.241	2.653
	Skippers	45	57.98	11.139					

Independent sample t-test Df-degree of freedom, $p<0.05$ is considered significant

An independent t-test showed that there is no significant difference in Hb level (t=-0.006, p=0.995), BMI (t=1.063, p=0.291) and Academic marks (t=1.181, p=0.241) among Breakfast skippers and non-skippers. (Table2)

Discussion

The present study shows that prevalence of Breakfast skipping in nursing students is 55.6% which is lower compared to the study conducted at in nursing college of Haryana (78.2%)[17] and Iraq (71%)[16]. The reason could be a difference in the geographical area and batch of the students included in the study. Also, in the present study, only first-year students were taken.

In the present study, there is no significant difference found in the academic score, BMI and Hb between Breakfast skippers and non skippers. In contrast, Study in the USA, US and Jpan showed that skipping Breakfast associated with obesity [18–20]. However, study conducted on Canadian adults revealed that skipping Breakfast is not associated withobesity[21]. Also, a study conducted in Denpasar, and review of literature conducted on breakfast habits and academic performance has shown the significant relation [22,23]. In Contrary, A study conducted by Andiarna F(2018) and one more study by Amrin(2014) revealed that skipping Breakfast increases the risk of anaemia [24]. The discrepancy in the result may be due to the geographical area, and cultural background. Also,the majority of the students were from the first year and stayed in the Hostel. Adjustment to the new type of food could be the reason for skipping Breakfast

Also, present study majority of the subject revealed the reason for skipping Breakfast as lack of time (82.71%), getting up late(58.02%), not hungry (56.79%), not interested in having Breakfast (33.33%) and tasteless food (58.02%). Which is similar to the study conducted by ALBashtawy M (2017), where children revealed the reason for skipping Breakfast was no enough time, nothing to eat, not hungry, poor appetite [25].

In the present study, there are many limitations such as small sample size, including only first-year nursing students and self-reported questionnaires, which might have caused the respondence bias. The study could be conducted with a larger sample size to get an accurate result.

Conclusion

Despite knowing the ill effects of Breakfast skipping its prevalent even in health science students. Though present findings show there is no significant effect of skipping Breakfast on BMI, Hb, and academic performance, it may affect the total nutritional status of students in the later period. Therefore creating awareness among students on the importance of breakfast habits is necessary.

Ethical Clearance: Was taken from Institutional Ethics committee Nitte Usha Institute of Nursing Sciences (Ref. No. NUINS/CON/NU/IEC/2018-19).

Source of Funding: This project was funded by Nitte (Deemed to be University).

Self Medication Practices among Youngsters: A Global Health Concern

Navdeep Kaur[1], Bandana Bisht[2], Manmeet Kaur[3]

[1]Vice Principal, Chitkara University College of Nursing, Chitkara University, Himachal Pradesh, India, [2]Principal, Chitkara University College of Nursing, Chitkara University, Himachal Pradesh, India, [3]Assistant Professor, Chitkara School of Health Sciences, Chitkara University, Punjab, India

Abstract

Self medication is considered as key aspect of primary health care to treat minor symptoms. However, inappropriate practice of self medication and related potential dangers has become public health concern worldwide.

Objectives: This study aimed at assessing the prevalence and frequency of practicing self medication. Common self diagnosed Disorders and prime reasons for engaging in self medication were explored by the researchers. Also, association between self medication and various sociodemographic variables was also discovered.

Method: The study employed exploratory design. A self structured questionnaire was administered to 500 students of selected University. The data were summarized and analyzed using descriptive and inferential statistics.

Results: Overall 442 (88.4%) students practiced self medication and approximately 77% of study subjects consume self medications occasionally. Headache (84.4%), common cold (83.8%), cough (82.6%) and gastric acidity (81.8%) were the most common minor ailments for which self medication is being taken. Major driving factors behind self medication are considering minor ailments non- seriously (83%), easy availability of medicines (82%) and lack of trust in institute dispensaries (79%). Further, no significant association was found between self medication practices and age, gender, year of study, academic disciplines, parents' education level, place of residence. *Conclusion:* Prevalence of self medication is remarkably high among scholars which constitutes health concern that requires conduction of awareness programs on risk and benefit of self medication at university level and stringent laws on sale of medicines without current prescription needs to be enforced to control malpractice.

Keywords: *Self medication, Prevalence, malpractice.*

Introduction

Self medication is a process of medicating oneself for self-diagnosed diseases. It involves consuming medicines without physician's advice, taking medicines on advice of pharmacist, relative or friend, using old prescriptions, sharing medicines with others and taking leftover medicines at home.[1-4] Key drives of self medication are inadequacies in healthcare system especially in developing world such as inaccessibility, inequitable distribution of health, high costs, patient' attitude and lack of healthcare resources.[5] Though, it provides the patients' greater independence in managing minor ailments, hence enhance empowerment. Also, self medication is advantageous to health care system and people when practiced correctly as it reduces time spent in visiting doctors, decreases load on medical services and saves cost.[6] Despite these facts, major problem is an inappropriate use of self medication thus resulting in detrimental consequences such as masking of potential health problems, severe adverse effects, and antibiotic resistance. Hence, Self medication has become a widespread practice and is an emerging health issue across the globe especially in developing countries.[7,8]

The prevalence of self-medication practice has risen sharply worldwide especially in economically deprived countries owing to limiting health resources. Certain projected evidences shown that prevalence of self medication in developing nations is in the range of 12.7% to 95%. [9-11] Moreover, there are huge variations in practice of self medication among population due to factors such as at age, gender, self care orientation, education level, drug access and exposure to advertisements by pharmaceutical companies.[9.10] Further, the most common ailments for which self-medication is being practiced are fever, headache, diarrhea, constipation, common cold as reported by many researchers.[11] Moreover, people do not refrain from consuming antimicrobials for self-care that may lead to serious drug related problems such as antimicrobial resistance and toxicity.[12,6]

Although, many studies are conducted at community level to assess magnitude of self medication, but only few studies are done to estimate prevalence in practicing self medication in youngsters who belong to the most vulnerable population. Through this study, researcher tried to explore the data from students of selected university with aims of find out the prevalence of self medication, common condition for which self medication is being used, and also to identify the association between factors such as age, gender, parent's education level and self medication practices.

Materials and Method

An exploratory study was conducted in selected university, Punjab, India in March, 2019. The sample size of 500 participants was determined using Power Analysis with formula as $n = z^2 P (1-p)/w^2$ at 5%.Respondents from the available population were chosen with multi-staged cluster sampling. In stage one, five departments were chosen, and 100 students were selected from each of the five departments in second stage using simple random method. Ethical approval was taken from ethical review committee of university. Also, an informed written content of respondents was taken with assurance of anonymity and confidentiality of data. Content validity of self structured tool was assured by five experts from departments specialized in pharmacy, nursing, health sciences and further data was collected using a pretested self administered questionnaire with closed and open ended questions. The respondents who were practicing self medication had to select/write the ailments for which they self medicate and the reason for such behavior. Finally, collected data was checked for completeness and analysis was done using SPSS latest version 25.

Results

The sociodemographic characteristics of the respondents depicts that most of them were females (55.9%) and hostellers ((52.8%). Majority of study subjects were from age group 19-20 years (65.6%) and having parental education level up to graduation and above (mother - 71.6%, father- 78.8%) as shown in table 1. Approximately 88% of the respondents admitted to self medication practice and majority of subjects 77.3% used self medication for treating minor illnesses occasionally as depicted in figure 1 and 2 respectively. Most common ailment for self medication is pain (84.40%), followed by respiratory problems (83.8%), gastrointestinal problems (81.8%) and other health problems (83.2%) as seen in table 2. Further, in pain, majority of respondents consume self medication for headache (84.8%), cold (83.8%) is the common respiratory condition for which self medication is being practiced whereas acidity (81.80%) and fever (83.2%) is the most common ailment in gastrointestinal and other problem for self medication respectively. Most common determinants that lead to self medication among youngsters were non- seriousness of illness (83.4%), easy availability of drugs (82%), lack of trust in institute dispensary (79.2%), Previous Prescriptions (74%), convenience (39%) and costly medicines prescribed by doctors (33%, table 3). Self medication practice was found not to be significantly associated with any of the sociodemographic variables.

Table No. 1: Frequency and percentage distribution of socio-demographic variables. N = 500

Variables	Opts	Percentage Distribution (%)	Frequency (f)
Age (in years)	19 to 20	65.6%	328
	21 to 22	33.4%	167
	23 to 24	1.0%	5
	24 to 25	0.0%	0

Variables	Opts	Percentage Distribution (%)	Frequency (f)
Gender	Male	44.2%	221
	Female	55.8%	279
Educational Status of Mother	Primary	1.4%	7
	Metric	13.6%	68
	Senior Secondary	13.4%	67
	Graduation and above	71.6%	358
Educational Status of Father	Primary	0.6%	3
	Metric	4.4%	22
	Senior Secondary	8.6%	43
	Graduation and above	78.8%	394
Place of Present Stay	Hostel	52.8%	264
	Home	45.4%	227
	Paying guest (PG)	1.6%	8

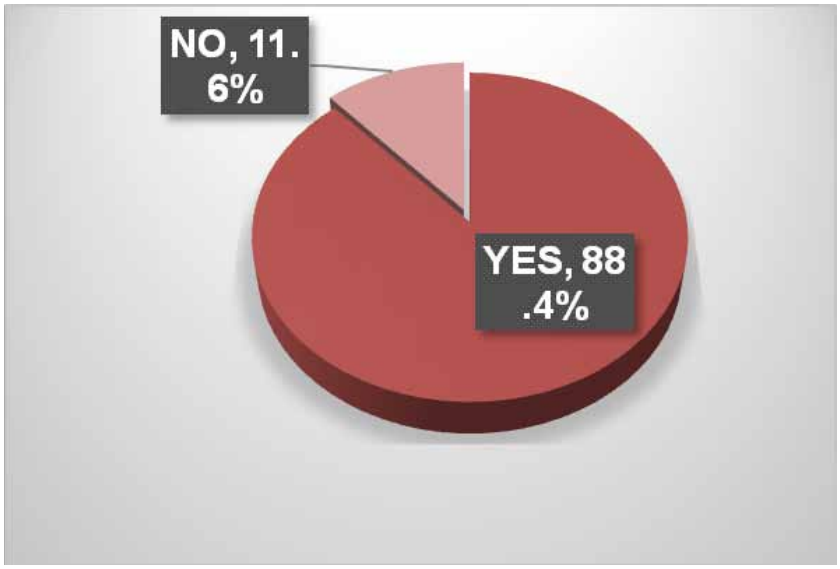

Fig no. 1: Prevalence of self-medication

Table 2: Common minor ailments for which self-medication is being used (N=442)

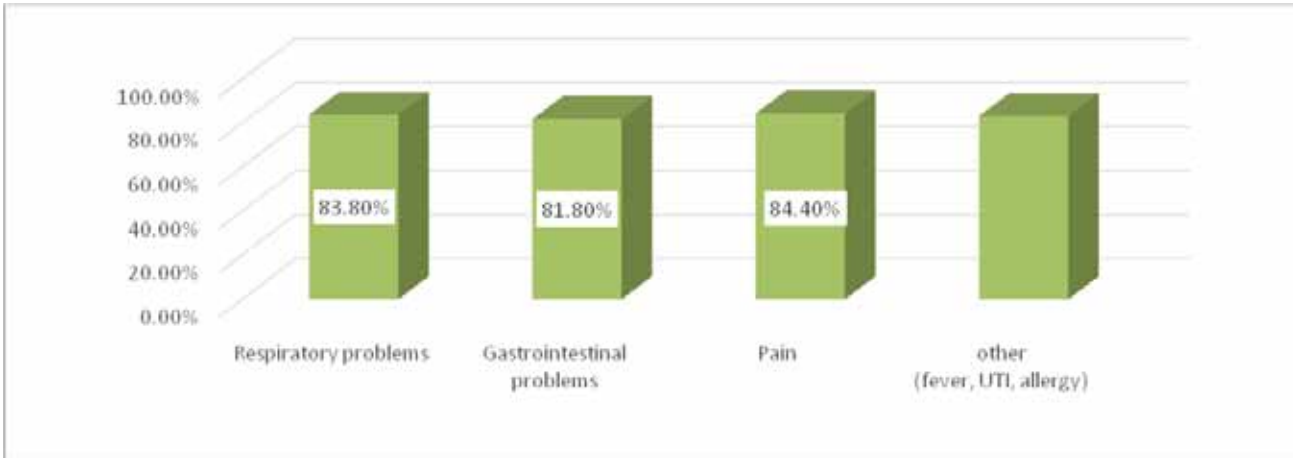

Table 3: Factors leading to self-medication among students N=442

Variables	Percentage (%)	Frequency (f)
Convenience	39%	195
Non- seriousness of illness	83.4%	417
Lack of trust in institute dispensary	79.2%	396
Easily available drugs	82.0%	410
Costly medications prescribed by doctors	33%	146
Previous Prescriptions	74.2%	371

Discussion

Prevalence of self medication is increasing worldwide particularly among youngsters and university students.[13,14] Many factors like readily available medicines, lack of accessible health services, extensive advertisement are leading causes of such practice.[15,16]

The findings of this revealed that the prevalence of self-medication is 88% among the university students and 77.3% respondents practice self medication now and then. The prevalence is considerable high and similar results were found in students of Bangladesh (100%), Brazil (86.4%), South India (92%) and South-west Nigeria (91.4%).[17,20] However, lower prevalence of self medication was reported by few studies as many university students declared not to self medicate.[21,22] In few, this difference could be attributed to the drug laws of country, accessibility to quality health services and discipline of the students

The results of this study reported that most common health problem that encouraged self-medication practice was pain (headache), followed by respiratory problems like cold, cough, then gastrointestinal problems such as acidity and, lastly for fever, UTI and allergies. Similarly, some studies reported comparable observations in which headache, common cold and fever were leading ailments for such practice[23, 11] where studies conducted in Egypt and western Nigeria found sore throat, intestinal colic, cramps and urinary tract infection, diarrhea as main complaints that lead to self medication respectively.[24, 25] These variations in findings could be because of different study population in all studies.

In the current study, causative factors for self medication practice among university students were non- seriousness of illness (83.4%), easy availability of drugs (82%), lack of trust in institute dispensary (79.2%) using previous prescriptions (74%). Various studies revealed many different reasons for indulging into self medication.[20, 26, 27] These reasons can be attributed to the fact the practice of self medication is influenced by several factors such as family, advertising, having previous experience, financial constraints. Not only this, seeking advice from pharmacists and friends to overcome the obstacles related to medical care cost and

dissatisfaction with medical care, lead to irrational self medication.

In present study, no association was found between self medication practice and sociodemographic variables. On the contrary, previous studies found that females tend to self medicate more as compare to males and this gender difference could be related to special health conditions in women like menstruation.[28] In addition to this, self medication is more common in residents of urban as per former studies. Reason for such variation can be described by difference in accessibility of health services.[24]

Conclusion

This study concluded that majority of university students engaged into self medication practice, and headache, cold, gastric acidity are the minor diseases for which self medication is being practiced. Further, non- seriousness about mild- illness, availability of drugs, lack of trust in institute dispensary and previous knowledge about disease were the main driving forces for indulging into self medication. Self medication, when used appropriately may not be harmful, but, it's inappropriate use poses a threat. So, awareness programs must be inculcated at university level to enlighten the youth about benefits and risks of self medication.

Limitations: One of the limitations is that analysis of this study was based on self report with chances of over and under reporting. Also, results of current study cannot be generalized to students of other universities of state and nation.

Conflicts of Interest: The researchers, hereby, declare there are no conflicts of interest related with present study or with materials and procedures used in this study.

Ethical Clearance: Ethical approval was taken from institutional ethical committee.

Funding: No

Service Quality Assessment of Higher Education by Gray Approach (The Case of Kerbala University)

Nawal Mousa Almeyali[1], Ali Al Mousawi[2]

[1]BSc, MSc, Quality Assurance Unit-College of Medicine-University of Kerbala, [2]MBChB, MSc. In Community Medicine Assistant Professor at the Department of Family and Community Medicine-College of Medicine-University of Kerbala

Abstract

The quality of higher education has become one of the main challenges facing educational systems in the last two decades. The promotion of services in the field of education and scientific research require active management that continuously improves academic services.

In this study, after identifying the indicators of the quality of higher education services, a questionnaire was distributed to 15 experts in order to elite the quality of higher education services in the university to assess these indicators and select the best effective ones. Then, a second questionnaire was provided to eight experts to evaluate the performance and the weight of these criteria in the university by using Gray weights.

The result of research revealed that the staff has the highest score and the university has a solid foundation. In order to reduce the existing gap, relevant academic subjects related to the disciplines need to be provided. Access to administrative services was improved, as well as electronic office services tailored to students' needs. In order to reduce the gap created for the environmental index, wider green space need to be developed within the university and increasing the opportunity for free web access and free access to valid and up-to-date scientific resources are needed.

Keywords: *Service Quality, Higher Education, Gray Weighting, University of Kerbala. Introduction.*

Introduction

We live in the Information Age characterized by the emergence of modern information and communication technologies(1). The educational system in every country is one of the most complicated social, economic and cultural sub-systems, and is considered as an influential factor in the realization of national macro policies. Considering the wide expansion of educational system activities, qualitative management of the educational system can play an important role in providing better institute's quality of education (Bazargan, 2015)(2). On the other hand, higher education is a source for inspiration and form the foundation for the development and advancement of any society(3).

To reach the goal of effective education in any educational institution; it is essential to establish an efficient teaching-learning process which could be comprehensively assessed in a framework of an effective behavioral system(4). For this reason the higher education systems in most countries in the world have established a quality management system in order to pay more attention to the quality of education, in addition to improving research and supplying of specialized services. The identification and evaluation an appropriate framework for managing the quality of higher education is one of the requirements for the success of higher education institutions for sustainability, advancement and growth.

The higher education system as a part of every country's educational system plays a critical and essential role in the development of various dimensions of economic and social and cultural development(3). Indeed; the growth and development of all systems in the society are dependent on the development of quantitative and qualitative dimensions of its higher education. In other words, the growth and development

of countries are tied to their educational system. Graduates of universities are responsible for government and society leading, cultural empowerment, originality, innovation, modern technology management, industry, trading and national security of a country. In the present era, the attention of the people and especially, the youth towards the educational system has been significantly increased. This is accompanied by an increase in the output expectations of the people from these institutions. Therefore, universities, on one side, should improve the quality of their services and on the other side, should have a continuous evaluating and observing system. Such body or system can monitor their current status and make plan for future improvements in these organizations. In the event of any problem; lack of a performance assessing system means losing links with the internal and external factors of the organization that are very important predictors of optimal performance. Indeed, the results of this performance assessment will be an improvement in the organization's activities since the organization cannot function without identifying the challenges and weaknesses that need rapid improvement[5-7].

In recent decades, the higher education system faces significant issues due to the growth of the technical procedure, wide-ranging social, economic and cultural changes and the urgent need for meeting the expanding needs of the community. A meta-synthesis approach was tried to designing a conceptual framework had concluded that out of 52 papers only 42 of them have mentioned codes and factors relevant to the infrastructure[8].

The assessment of quality techniques for identification of the differences and similarities surrounding quality improvement efforts covers each of three service areas typically found in higher education: academic, administrative, and auxiliary functions[9]. To assess the quality of services, Shick and Partners (2007) have designed aDeep Learning Skoval model(D.L. Skoval model) based on the combination of models of SERVQUAL and E.S.Q. The designed model has 12 indices: reliability, accountability, trust, empathy, merit, politeness, availability, efficiency, security, flexibility and communication. The Institute of Higher Education for Politics in Washington, DC, has conducted comprehensive studies in guaranteeing quality. Their research results in 2009 showed that organizational support, course development, teaching/Learning, course structure, students support, faculty support, evaluation and valuation are the essential factors in ensuring learning organization[7]. Many external studies in the field of multi-criteria decision making have been done to deal with the ambiguity of judgment. Several effective phase models and linear programming models have been presented. However, in recent years, after the presentation of the theory of Gray system by Deng and despite this theory being young and new, it has been used to find the solution for the problems in various fields of science, especially in regards of modeling, prediction, Gray relation analysis, and Gray decision making.

In most cases where the goal is choosing the preferred option and ranking options in uncertain conditions, Gray decision making has been used as a powerful method. Other foreign backgrounds are listed in the table below. In this table, in addition to the author and year of research, the studied university and results of the research are also presented. In Gray relational analysis method analysis method depends on Gray system theory[10]. According to the similarity or difference of the developmental trend among the factors, it could measure the relevancy among factors"Gray relevancy". The Gray relational analysis method could be used to describe the relative changes among factors in the system development process. If the relative changes of the two were basically the same in the development process, we could consider the relevancy between them is large, while, conversely, the relevancy is small. In the real world, the relevancy among many factors is Gray, namely the overall information and mutual relevancy is ''indefinite''. Therefore, when analyzing the relationship between two factors, we could apply the concept of relevancy to measure the relation between each factor and describe their relative changes quantitatively.

Ghasemi and Ahmadi (2013)[11], Evaluated Higher Education Institutes Performance in Zanjan province by BSC and GAHP. They used a new model is implemented for ranking the institutes. The research population includes 21 faculty members selected by random sampling. 3 separate questioners collected data, analysed by SPSS software, and weighted by Team Expert Choice software. The results of this research showed that in non-profit institutes of higher education, the most important criteria include higher income, reliability and number of students accepted for higher education.

Recently Ghasemi and Alizadeh (2017) use GMCDM technique to assess antifragility's performance of Iran Banknote papers. Table 1 summarised mentioned research[12].

Table 1: Summary of research background

Author	Year	University	Goal and model used
Owlia and Aspinall [13]	1996	Birmingham university	They presented a new framework for the dimensions of the quality of higher education services.
Waugh [14]	2002	Administrative quality in Australia.	He suggested a model for the University's administrative quality.
Lalovic[15]	2002	The Belgrade university	He presented an evaluation model using the Six Sigma methodology.
Lagrosen, Hashemi, and Leitner [16]	2004	University of Australia and Sweden	They evaluated dimensions of service quality in higher education institutions and compared these dimensions.
Yang, Yan-ping, and Jie[17]	2006	China Higher education	They studied two. They suggested a suitable model for evaluating the quality of service in China using the SERVQUAL model.
Tsinidou[18]	2010	Turkey	They studied two universities in Turkey and concluded that students care most about the two dimensions of empathy and quality of service.
Noaman[19]	2010	Higher education institutes in Greece	Decision-makers in higher education service quality were identified.
Ghasemi and Ahmadi[11]	2013	Nonprofit Higher education institutes in Zanjanprovince (Iran)	Evaluation of Higher Education Institutes Performance by BSC and GAHP
Ghasemi and Alizadeh [12]	2017	Antifragility Assessment	Application of Gray MCDM to antifragility assessment of Iranian Banknote papers.

Source: Noaman, Amin Yet al. (2014)[19]

The literature review showed only few studies in Iraq evaluated the service quality in higher education. A study assessing the private open university in a study in a tourism college in Mosul in 2007 reported that technical and administrative level was low[20]. While a more recent study in the College of Tourism Sciences concluded that there is a kind of good performance related for the organization, planning and evaluation, and support for users, but there is a Kind of average performance related to resources and facilities[21]. Another study in the Administration and Economics College at the university of Anbar concluded that the quality team lacks accountant of quality costs which made a weak in detailed documentation of quality costs[22]. While a study in Baghdad University tried to determine the links between strategic planning and entrepreneurial quality through a survey among 65 academic staff in three faculties concluded that a significant association was found[23]. Additionally, a study in Dewaniyah Technical Institute concluded that building a knowledge Society is fundamental point for students satisfaction [24].

Methodology

Tsinidou, Noaman, Ragab, Madbouly, Khedra and Fayoumi[18], in their research titled "Higher Educational Quality Assesment Model to achieve educational quality standards " at King Abdulaziz University (Saudi Arabia) presented HEQAM model for improving academic services. This model has eight main dimensions (curriculum, academic staff, business perspective, infrastructure, e-services, library services, office services and environments).

Research Methodology:

Method of data collection

The most important method of data collection in this study were as follows:

1. Library study: In this field to collect information in theoretical Foundations and topic research literature; library resources, articles, books and the internet have been used.
2. Field researches: In this section, a questionnaire was used to collect data and information for analysis. The questionnaire is a highly structured technique for collecting data, in which for each answer the same set of questions are asked. The mentioned questionnaire includes:

   (a) General questions: In general questions, the attempted concentrates on collecting project-

doers' profile, general and demographic information of respondents.

(b) Particular questions: This section contains 57 questions related to various factors adapted to the literature of the subject. When designing this section, questions have been tried to be as short as possible, hence easily understood, and to avoid asking negative questions. To design this section, the 5-option Likert spectrum has been used, which is one of the most common measurement scales.

Table 2: The questionnaire preparation guide

Factor name	Number of questions	Reference
Educational program	6 Questions	SERVQUAL (Parasuraman et al. *)*, 1985) [25]
Staff	11 Questions	SERVQUAL (Parasuraman et al.), 1985)[25] Noaman,Amin et al (2014)(19)
Infrastructures	7 Questions	SERVPERF (Cronin and Taylor, 1992) and SERVQUAL (Parasuraman et al., 1985)[25]
Environment	6 Questions	HEdPERF (Abdullah, Firdaus 2006)[26]
Office services	10 Questions	Noaman, Amin Yet al. (2014)(19)
Library services	6 Questions	HEdPERF (Abdullah, Firdaus, 2006) [26], (Noaman, Amin Y et al. (2014)[19]
Electronic services	5 Questions	HEdPERF (Abdullah, Firdaus, 2006)[27]
Job perspectives	6 Questions	Noaman, Amin Y et al. (2014)[19]

In each research, various stages are gone through. In many books, a precise number of research steps have been mentioned, such as the formulation and clarification of an issue or a topic, literature review, research design, data collection, data analysis, and writing. However, Sanders and colleagues (2009)[28], believe in rare cases, all of these steps happen in a row, without going back to the previous stages. In reality, we may want to go back to the previous stages and review our operations. Every time previous stages are rectified, the idea of research slightly changes, and this change is reflected in all stages of the research. However, in this research, it has been attempted to do the research process in a reasonable order.

After preparing a long list of criteria, it is the time for their refinement and screening. The reason for this is the high number of extracted criteria, preventing the possible reduction of the accuracy in completing questionnaires related to the weight of selected criteria, and the likelihood of an increase in inconsistency rates in experts responses. Screening of the extracted criteria was done by using a survey on experts about determining the most important criteria affecting the quality of education services according to a Likert spectrum. In order to have the necessary validity for this questionnaire, it was attempted to avoid using complex phrases as far as possible. To assess the reliability of this questionnaire, the Cronbach Alpha has been used. The estimated value of this index for the whole questionnaire was 0.927.

Then, after collecting completed questionnaires and in order to distinguish criteria with a higher degree of significance, the binomial test (sometimes called the ratio test) was used.

The assumptions of the mentioned test are as follows, in which the null hypothesis (H_0) which expresses the lack of effect for the variable and an alternative hypothesis (H_1) which expresses the presence of effect for the variable.

Equation 1:

$$\begin{cases} H_0: P = P_0 \\ H_1: P \neq P_0 \end{cases}$$

After distributing the questionnaire and collecting information through the binomial test (ratio), the most critical indices were extracted and became the base of the research. **Giving Weight to the criteria using the Gray method**

During the initial step, the analysis process was formulated by a group of eight specialists in a targeted manner with already-mentioned explanations. These specialists answered the questionnaire related to

identifying eight qualitative components that resulted in the presentation of 28 characteristics in the university.

Choosing approximate language terms for evaluating performance rate and weight of the importance of qualitative characteristics

To help professionals while allocating the performance rate of qualitative characteristics; linguistic terms in Likert scale were chosen as Excellent, very good, good, fair, poor, very poor, worst. In order to assess the importance of weighting the qualitative characteristics, linguistic terms have been chosen as very high, high, fairly high, medium, relatively low, low, very low. The Gray triangular used numbers along with the linguistic variables during the research to facilitate analysis (Table 3).

Table 3: The linguist terms and its peer Gray numbers

Language terms	Gray numbers	Language terms	Gray numbers
The worst (w)	(0-1.5)	Very Low (VL)	(0-0.15)
Very weak (vp)	(1-3)	Low (l)	(0.1-0.3)
Fair (f)	(3-7)	Medium (m)	(0.3-0.7)
Very good (vg)	(7-9)	High (h)	(0.7-0.9)
Excellent (e)	(8.5-10)	Very High (vh)	(0.85-1)

Linguistic terms and synonyms Gray numbers (peer-to-peer) have been adapted by previously-performed studies about performance assessment related to qualitative assessment and was confirmed by the experts.

Assessing the importance of gray weight of quality characteristic: According to the following table, the weight of the lower and upper limit of the qualitative characteristics for each variable has been for Educational program, Staff, Infrastructure, Environment, Office services, Library services, Electronic services and Job perspectives: 0.894, 1, 0.832, 0.949, 0.982, 0.989, 0.892, 0.915, respectively. The highest weight is for the staff criterion (6.85-8.95), and the rest of the criteria have been normalized. It seems that the staff in the university, in terms of experts and quality specialists, had acceptable performance. The lowest weight was assigned to the university infrastructure criterion (2.58-5.41). The other criteria were: educational program (3.72-6.81), environment (4.81-7.00), office services (4.75-7.58), library services (5.56-8.43), electronic services (4.88-7.12) and job perspectives (4.15-7.06).

Performance rate of qualitative characteristics: A detailed assessment of the expert assessment of the qualitative characteristics showed that very good (VG) assessment formed the majority of answers (%, 23 Out of 40, table 4).

Table 4: Details of the expert assessment of the qualitative characteristics Integration of Gray rates and weights

Qualitative Characteristics	Experts evaluation							
	E1	E2	E3	E4	E5	E6	E7	E8
Curriculum provides appropriate scientific subjects.	VG	VG	VP	VP	F	VG	E	F
The curriculum includes specialized courses (software education).	F	F	VP	E	F	F	F	F
University staff never turn down students' requests to cooperate	F	F	VG	VG	E	VG	E	VG
Staff have a good relationship with students.	VG	VG	E	VG	VG	VG	VG	VG
University staff spend adequate time to consults with students	VG	F	VG	VG	VG	VG	VG	VG

The arithmetic means, mode and median are method that are adapted to integrate multiple decision-makers assessments. The arithmetic mean due to its widespread use, have been used for research to integrate and unify comments, during the research. During the research, the arithmetic mean of Gray performance rate and arithmetic mean of performance rate for each characteristic has been determined by Rj and Wj symbols. Calculation of Rj and Wj through equation 1 and 2:

Equation 1:

$$R_j = (a_j, c_j) = \frac{R_{j1}+R_{j2}+\cdots+R_{jm}}{m}$$

Equation 2:

$$w_j = (x_j, z_j) = \frac{w_{j1}+w_{j2}+\cdots+w_{jm}}{m}$$

In order to unify and consolidate the Gray rates and the Gray weights used to determine the overall qualitative Gray index equation three have been used:

Equation 3:

$$\text{GQI} = \frac{\sum_{j=1}^{n} w_j \times R_j}{\sum_{j=1}^{n} w_j}$$

For example, the two qualitative characteristics of the curriculum and staff are calculated as follows:

Curriculum Characteristic:

$$\begin{cases} R_j = (6.81, 3.71) \\ w_j = (0.93, 0.74) \end{cases}$$

Staff Characteristic:

$$\begin{cases} R_j = (8.95, 6.85) \\ w_j = (0.94, 0.75) \end{cases}$$

As a result, the integrated Gray index for two characteristics is calculated as follows:

$$\frac{\sum_{j=1}^{n} w_j \times R_j}{\sum_{j=1}^{n} w_j} = \frac{\{=(6.81,3.71)\times(0.93,0.74)\}+\{(8.95,6.85)\times(0.94,0.75)\}}{(0.93,0.74)+(0.94,0.75)}$$

Similarly, the integrated Gray index for all indices is calculated as a general index. After calculating the whole performance rate average and the arithmetic mean of Gray weights for all characteristics, according to equation three the general integrated Gray quality index (GQI) of qualitative characteristic is GQI=(4.80,7.33).

Conclusion

Determining the Euclidean Distance to Adapt to Approximate Level of Quality: When the Gray quality index is obtained, it should be adapted to the language and verbal terms in order to determine the amount of quality level. During this study, the Euclidean distance method will be used for this purpose, since this is the best and most intuitive and understandable way for humans. In this study, linguistic expressions such as, Extremely Quality, Very Quality, Quality, Fairly Quality, Slowly Becoming Quality have been used in order to adapt and determine the quality level. Linguistic expressions and corresponding Gray numbers are given below:

Extremely Quality (EQ) = (8.5-10)

Very Quality (VQ) = (5.5-8.5)

Quality (Q) = (3.5-5.5)

Fairly Quality (FQ) = (1.5-3.5)

Slowly Becoming Quality (SQ) = (0-1.5)

Then Euclidean distance is calculated as follows:

$$D = \sqrt{\left\{\sum \left(f_{FAI}(x) - f_{AL_i}(x)\right)^2\right\}}$$

D(FA,EQ)=4.556601
D(FA,VQ)=1.3585.1
D(FA,FQ)=5.061145
D(FA,Q)=7.557464
D(FA,Q)=2.2499

By comparing the values of the calculated Euclidean distances, it is observed that the lowest Euclidean distance is related to the Very Quality level; resultantly the qualitative performance level of the university is Very Quality level (VQ).

After Euclidean calculations of each criterion, the final result categorized based on indices is presented in table 7. According to the table below, most of the indices have a desirable quality in the studied university.

Infrastructure, environment and career prospects indices have lower quality in comparison with other indices. Therefore, quality improvement programs in these indices should be prioritized by university officials. The results showed that the Educational program, Staff, Infrastructure, Office services, Library services, Electronic services were in ‘’very quality’’,

while was in ''Satisfying quality'' for Environment and job Perspectives.

As expected from the comparison of the status quo and desirable situation of quality of higher education services criteria, there is a significant gap between some criteria. This Figure has been presented below.

As mentioned beforehand, for assessing the quality of higher education services, eight indices at the current level and desirable level were evaluated among eight academic experts through a questionnaire approach. For calculating the importance of the main indices, the given points of sub-indices were averaged. Moreover, to reach a better analysis, all collected data were normalized and then analyzed.

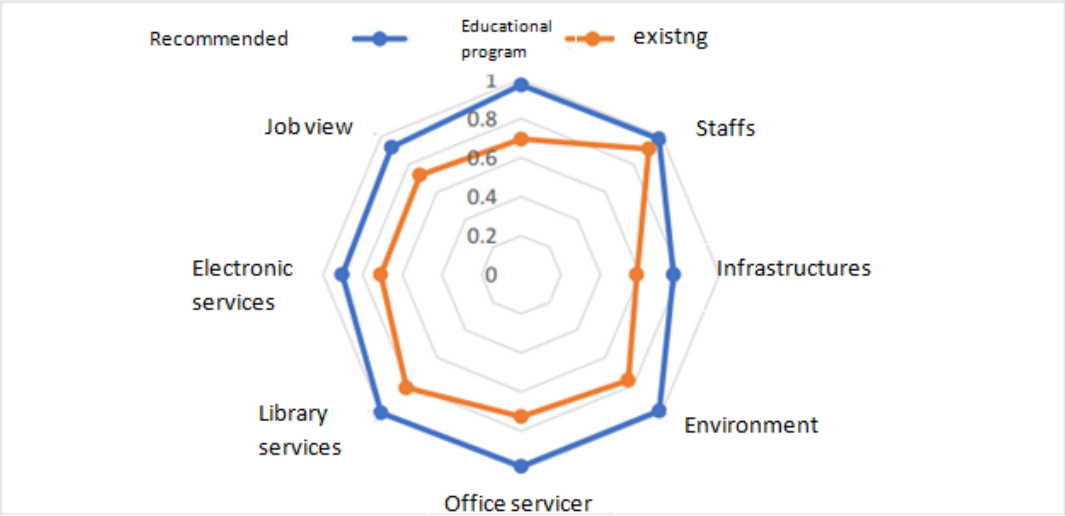

Figure 1: Comparison between existing status and recommended status of higher education services quality dimensions

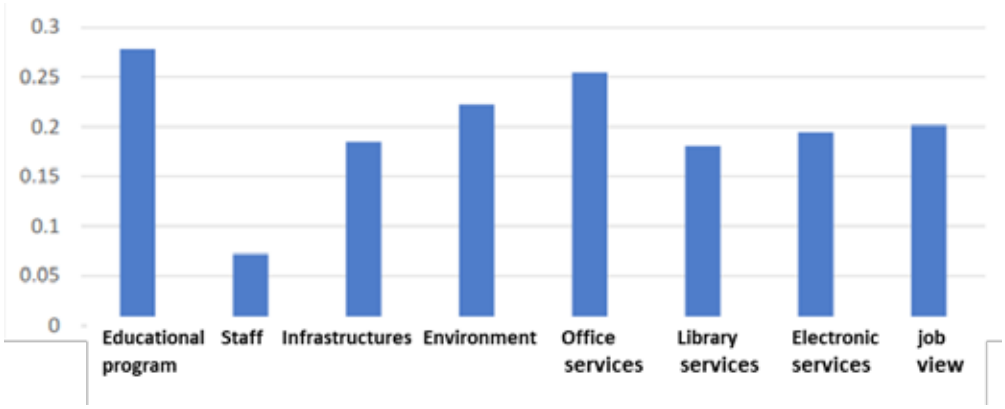

Figure 2: The rate of guff in existing weights of quality dimensions in Kerbala university higher education services

With a slight reflection in comparison of the current and desired weights, it can be understood that the lowest gap in staff index and the highest gap is in the university's curriculum index. For a better analysis of the gap in weights of each criterion, the bar chart (Figure 2) is presented:

According to Figure 1 and by comparing the current and desired weights, it can be concluded that the lowest gap is staff index. In other words, it can be said that from the viewpoint of specialists and experts of the quality of Kerbala University, staff have performed their duties correctly and have the necessary commitment to perform their duties. Therefore, there is not a noticeable gap in this criterion.

Results

1. It seems that considering achieved quality dimensions in this study can be used in assessing the quality of academic services. The results of the present study indicates that management process quality of departments at the university is rather desirable and requires planning its improvement
2. Looking at the obtained weights in the table showed that the staff have the highest weight. This means that the performance of the staff in the studied university is within acceptable limits. For this purpose, to maintain the status quo, an appropriate reward system can be established for the staff in the university.
3. Library services are ranked second. However, it could be understood that the provided library services at the university, as well as staff services, have a satisfactory level.
4. University environment: Due to the gap between the status quo and the desired situation, it is recommended to improve the available commuting services (such as provision of transportation services, precise timing and scheduling for commuting according to the peak hours of students attendance and improvement of covered routes in different spots of town), or partially, in routes where coverage of services is not possible. The cost of students' commute is partially paid by the student. Moreover, the development of parks and green spaces are also proposed due to the lack of enough space for the students.
5. Administrative and electronic services: According to Figure 2, the university situation in this criterion is far from being desired, and it is suggested that, in order to reduce the gap between the current and desirable status of this criterion, the administrative processes of the university should be clearly explained to freshmen. In addition, reviewing the administrative processes will provide students with fast, efficient and accurate services. Also, to facilitate the use of these services and access to them for students; it is necessary to synchronize the hours of administrative services with hours of student attendance at the university. Due to the nature of the administrative service; these services should be provided electronically with appropriate technical support to avoid loss of time and money. Also, appropriate communication tools (such as telephone operators) should be used to address student problems in different service units.
6. Library Services: To overcome the gap between the status quo and the desirable condition in this criterion, the university is recommended to update bookshelves and add books published in recent years to the shelves. Necessary facilities for students to access to new profiles and valid journals should be provided. Development of electronic library services (such as the extension of fines payment for late delivery of books and others). Considering copyright law, an e-book sharing network for students should be followed. Also, selecting the right place (that has enough lighting, internet access, providing reading equipment, and others) of the library for students to study.
7. Career perspective: To bridge the gap between the current situation and the desired situation in this criterion, it is suggested that a unit called "Relationships with Business" should be established that allows students to get acquainted with different occupational fields and get familiar with new job titles and opportunities. Also, negotiating with foreign universities provide students with the opportunity to continue studying abroad. A road map for different fields should be providing to make clear to students their career perspectives.
8. Curriculum: According to Figure 2, the biggest gap between the current and desired status is in this criterion. Therefore, it is suggested that firstly a good academic program should be provided; secondly, by offering special courses (including up-to-date software training programs), they improve this important dimension. (To any one to five) . Also, given the assigned weight to each criterion (Table1), this one has a good weight.
9. Staff: This qualitative dimension has the lowest between the current and the desired status. Also, the assigned weight for this criterion is the highest. Therefore, university authorities are suggested to set up a rewarding system proportionate to staff's performance and by providing better facilities, they try to maintain the status quo or even improve it.
10. Infrastructure: This criterion has attained the lowest weight. It seems that the university did not perform well in providing infrastructure and electronic services, including well-equipped buildings, green Service quality assessment in higher education,

and the case of Technological Educational Institute (TEI), Greece. In 9th International Conference on Marketing and Development: Marketing Contributions to Prosperity and Peace (pp. 8-11). spaces, sports facilities, well-equipped classrooms and laboratories, and medical facilities. Also, the gap between the existing and desirable situation of these dimensions are almost equal and worth pondering. Therefore, it is recommended that the university officials improve the existing situation by improving the university's infrastructure facilities (including building well-equipped buildings and laboratories, providing appropriate treatment facilities, expansion internet services, and others).

Effectiveness of Breathing as a Non-Pharmacological Method to Reduce Pain Severity among Woman During Labor

Nawras Monim Alzurfi[1], Shukriyia Shadhan Al-Ogaili[2]

[1]Research Scholar, Maternity Department/Faculty of Nursing/University of Kufa, Iraq,
[2]Professor, Health and Medical College Techniques, Al-Furat Al-Awsat Technical University, Iraq

Abstract

The aim of the study is identify the effect of non-pharmacological method technique (breathing) on severity of pain through comparing woman's pain score during labor.A quasi-experimental Design is used through the present study in order to achieve the study objectives. The period of the study is from 15th January to 4th June 2020. A Non-Probability (Purposive Sample) of (60) women (30) of them are control group and (30) women are the study group, selected from those who are admitted to Al-Zahraa Maternity Teaching Hospital/ Al-Forat Teaching Hospital, are included in the study sample. Labor pain was assessed using the scale known as: Face, Leg, Activity, Cry, And Consolability (FLACC). Breathing Technique was used as a non-pharmacological method to reduce pain **.** The current study revealed that applying the non-pharmacological pain managing interventions (breathing) showed a remarkably significant reduction in pain according to in FLACC behavioral scale regarding the other stages (active phase (after intervention); transition phase; second Phase; third Phase) which. . It is concluded that breathing has reduced pain during active phase, transition phase, and second phase .

Keywords: *Breathing, Non –Pharmacological, Pain Severity, Woman Labor.*

Introduction

Women often mention, that because of their anxiety they would prefer a caesarean section rather than a natural delivery(1). Occasionally, women feel little if any pain in labor and give birth unexpectedly(2). Labor pain has its two elements: visceral and somatic. The visceral one occurs during the first stage of labor and it is connected with the tension exerted on the cervix, which causes its dilatation. That is felt by a parturient as a pain. The somatic kind of pain appears at the end of the first stage and it lasts also in the second stage. It is a result of the force exerted on the vaginal part of the cervix, the vagina and the perineum(3). Labor pain management is not only a crucial concern for future mothers but also a great challenge in modern medicine. A wide range of both pharmacological and non-pharmacological labor pain relief techniques are currently available for pregnant women in Poland. The first group includes: epidural analgesia, gas for pain control and intravenous opioids. Non pharmacological techniques contain water birth and water immersion, transcutaneous electrical nerve stimulation (TENS), aromatherapy, acupuncture and acupressure, massage techniques(4). In general, labor pain management means use complementary and alternative medicine (CAM) that includes herbs, vitamins and minerals, massage, aromatherapy, acupuncture, homeopathic remedies as well as psychological, physical and spiritual techniques. Its prevalence is increasing in developed countries likewise in the united states of America (USA) used by more than one third of pregnant women, while in the united kingdom (UK) used by (57.1%) of women during pregnancy . In Arab countries, it is used by (40.0%) in Palestine, (75%) in Jordan, and (22.3%) in Iran. However, women in Iraq are little is known about the use of pain management during labor (5).TO identify the effect of non-pharmacological method technique (breathing, back massage) on severity of pain through comparing woman's pain score after the application of these method. The aim of the study is identify the effect of non-pharmacological method technique (breathing) on severity of pain through comparing woman's pain score after the application of these method .

Method

A quasi-experimental Design is used through the present study in order to achieve the study objectives. The period of the study is from 15th January to 4th June 2020.

A Non-Probability (Purposive Sample) of (60) women (30) of them are control group and (30) women are the study group, selected from those who are admitted to Al-Zahraa Maternity Teaching Hospital/Al-Forat Teaching Hospital, are included in the study sample.

Part 1: Demographic Data: A demographic data sheet, which consists of (6) items, include: Age, level of education, monthly income, occupational status of wife, occupational status of the husband, and resistance environment.

Part 2: Reproductive Health Data: The second part of the questionnaire is comprised which including expected date of delivery, history of current labor, gestational age, uterine contraction, duration and frequencies), membrane status for each stage.

Part 3: Pain Assessment (FLACC behavioral Scale): This scale has been constructed to assess the labor pain in a behavioral pain scale (Face, Leg, Activity, Cry, And Consolability (FLACC). It includes five categories ranged from 0 to 2 scale, which results in a total score of 0-10, (0 = relax and comfortable, 1-3= mild pain, 4-6 moderate pain, 7-10= sever pain).

Part 4: Breathing Technique was used as a non-pharmacological method to reduce pain.

Statistical Analysis: Descriptive statistics presented as mean, standard deviation, frequencies and percentages. Chi-square test was used to compare frequencies. Pearson's correlation test was used to assess the correlations. Level of significance of ≤ 0.05 was considered as significant difference or correlation.

Results

Table (1) shows the highest percentage of the women subgroup are : women ages between (16-20) years old (50% for study group and 40% for control group), those who live urban residents (86.7% for study group and 73.3% for control group), those who are secondary school graduated (30% for study groups) and primary school graduates (26.7% for control group), house wives (90% for study group and 83.3% for control group) .

Table (1) Statistical distribution of study sample (women) by their demographic data

Items	Sub-groups	Study Group Total = 30		Control Group Total = 30		Chi Sq. P value
		Freq.	Percent.	Freq.	Percent.	
Age/Years	16-20	15	50.0	12	40.0	0.93 (0.62)
	21-25	9	30.0	9	30.0	
	26-30	6	20.0	9	30.0	
Family Income	Sufficient	5	16.7	8	26.7	4.93 (0.08)

	Mild	0	0.0	0	0.0	
	Moderate	24	80.0	3	10.0	
	Severe	6	20.0	27	90.0	

Discussion

The present study reveals that the highest percentage of the women subgroup are : women with ages between (16-20) years old (50% for study group and 40% for control group) (table 1). This result is supported by Shrestha who indicated that labor pain was found to be more sever in younger age (adolescence parturient) as compared to those above 20[6]. In addition, these results study reported by Vyas, et.al who evaluated intra partum non-pharmacological pain relief techniques during labor, and found that out of the (60) sample of primigravida woman, the highest age groups were aged between (18-22) years old and that was (41.7%) and the lowest were found in the age group of (30-34) and they are accounted (11.7%)[7].

Concerning the level of education, the study reveals that the highest percentage of the study sample are secondary school graduated (30% for study groups) and primary school graduates (26.7% for control group), (table 1).

These result was in agreement with study conducted by Daniel, et al. who stated that the pain of a woman experiences during labor and birth is subjective, indivisaulized and caused by a number of interrelating factors such as physical, affective, psychological and environmental components all shape the pain experience. One of these factors is the educational level of women which majority of them (26.7%) are primary school graduates[8].

The study results reveal that the highest percentage of the study sample are live urban residents (86.7% for study group and 73.3% for control group). This is agreement with across-sectional survey on Iraqi woman that use of complementary and alternative medicine in pregnancy reported by Hwang et al. found that (53.7%) of Iraqi woman Women Were living in urban areas[9].

The study result reveals that the highest percentage of the study sample are barely sufficient family income (50% for study group and 63.3% for control group) They are accounted through applying of the Ministry of planning and Development Cooperative/Central Statistical Organization Technique and Information Scale. These results are in constant with studies reported by Johnston-Robledo [10]who stated that Insufficient of women were less likely than Sufficient Women to attend childbirth centers and classes and they are more likely to acquire information about childbirth from their mothers rather than acquired information from medical personnel during prenatal care visits. So that, these women experience higher levels of pain during childbirth. In addition, Al Ahmmar and Tarrafindicated, that the women with Sufficient of socioeconomic was more convinced with the labor process than those with Insufficient[11].

Table (2) show that reveals statistical distribution and difference in overall assessment of FLACC behavioral scale between study and control groups, it shows that there is no significant difference between study and control groups according to the evaluation of pain sings in term of FLACC behavioral scale; expect for face signs which indicated increased pain in the control group.

These finding are supported with a randomized controlled trial study in Turkey reported by Yuksel et al.[12] which measured the effects of breathing exercises on maternal pain during the second stage of labor which revealed that the mean visual analog scale score of intervention the study group and control group were (88.+ 6.3) and (90.5)+ 7.0), respectively (p> 0.001). based on this study, breathing exercises for women are effective in reducing the perception of labor pain; therefore breathing exercises consider an effective method pain management and lessening the duration of labor. The finding of the current study are supported with studied which used non-pharmacological pain relief method. A study reported in India by Jhala and its results show that practice of breathing exercise conditioned the mother to breathe and relax during contractions to control the experience of pain in gravid mothers, and shortens the duration of labor and prevents the complications during labor[13].

Conclusions

It is concluded that breathing has reduced pain during active phase, transition phase, and second phase.

Vitik Detection of Aerobic Spore-Forming Bacteria Isolated from Raw Milk, Skim Milk Powder and UHT Milk

Nawres N. Jaber[1], Nada Salih Hadi[1], Abeer Laily Mohammed[1], Marwa Idan[1], Adyan Niama[1]

[1]Scholar Researchers, Department of Microbiology, College of Veterinary Medicine University of Basrah, Basra, Iraq

Abstract

Background Aerobic spore-forming bacteria can be found in a wide range of environmental niches such as food production. Among them, the aerobic spore-forming bacteria like *Bacillus ceruse*, pose a risk of causing dairy product poisoning by the production of toxins.

Materials and Method: Out of 40 samples, 10 from each of Raw Milk, Skim Milk Powder, UHT Milk and Wight chees were collected to isolate aerobic spore-forming bacteria by morphological, physiological and biochemical tests.

Conclusion: A total of 25 isolates of heat resistant bacteria, 10(40%), 8(32%), 3(12%), 4(16%) from "RM, white chees, SMP and UHT milk respectively," were purified and characterized. Various spore forming bacteria belonging to Bacilli spp. which include pathogenic were biochemically identified using vitek 2 systems, the result showed the highest rate of *Bacillus subtilis* (28%) followed by *Bacillus ceruse* and *Bacillus thuringiensis* (24%).

Keywords: *Vitik Detection, Aerobic Spore-Forming Bacteria, Raw milk, Skim milk Powder, UHT milk.*

Introduction

Spore-forming bacteria is gram-positive microorganisms aerobic or anaerobic, ubiquitous in nature. Bacterial spores are common contaminants of food products, and their outgrowth may cause food spoilage or food borne diseases. Bacilli and Clostridia remain the most important classes relevant to the dairy industry(1). The *Bacillus* genus, part of the Bacillaceae family, have been recognized as major contributors to dairy product quality issues over the past 2 decades. They have a remarkable range of physiological characteristics that renders appropriate categorization and generalizations impossible(2,3). They are a primary cause of concern for the international dairy industry because of the pervasive and resistant nature of their spores in comparison to vegetative cells, surviving environmental challenges, such as heat, desiccation, freezing, thawing, presence of organic solvents and oxidizing agents, and UV irradiation, as well as predation by protozoa(4).

Spore-forming bacteria pose the greatest spoilage threat to dairy products, causing severe economic losses, equipment impairment and/or reputational damage of food companies. Bacilli and related genera are responsible for spoilage problems in milk and dairy products such as bitty cream, sweet curdling, off flavor, flat sour, non-sterility, bitterness, ropiness, interference with cheese production, and cheese blowing(5,6,7,8,9).

Material and Method

Sample Collections: A total of forty samples, including: 10 samples from each of Raw Milk, Skim Milk Powder, UHT Milk and Wight cheese samples were collected during the period from September to December

2019 from Basrah city markets according to standard Method for the Examination of Dairy Products[10].

Enumeration of total viable and aerobic spore-forming bacteria: Total viable counts of all samples and aerobic spore-forming bacteria were enumerated using the nutrient agar mediums. The bacterial and spore bacterial count was expressed as cfu/ml or g milk and cheese[10]. However, the samples of RM and SMP and cheese after preparation were heated in water bath at 80oC for 10 minimums then they cooled suddenly to the room temperature before transferring one ml aliquots in petri dishes[11].

Isolation of aerobic spore-forming bacteria: Some of the colonies, which suspected to be *Bacillus* spp. according to the colony morphology on Nutrient Agar and blood agar were identified by using Gram's staining, motility, spore staining, catalase test, hemolytic activity on blood agar[12], Casein hydrolysis test [11] and Lactose fermentation test [12].

Biochemical identification of Bacteria using Vitek-2 System: VITEK-2 system imparts an automated, computer-based technique of species identifications, relies on advanced colorimetry technology, the measurement of light attenuation associated with each biochemical reaction in VITEK cards.

Antibiotic susceptibility test: The antimicrobial susceptibility testing was determined by the disk agar diffusion method [13]. It tested for susceptibility to 7 antimicrobial disks. Erythromycin E (15mg), Cadazolid (10mg), chloramphenicol C (30mg), Cephalexin CN (10mg), Ciprofloxacin CIP (30mg) and Tetracycline TE (30 mg).

Results and Discussion

Enumeration of total viable and aerobic spore forming bacteria in raw milk, cheese, skim milk powder and UHT-milk

The results in Table (1) shown that all RM and white cheese samples contain highly bacterial levels or counts according to the ESS (No, 0154-01/2005) the average of the total number of micro-organisms should not exceed 100.000 per ml (log 5 cfu/ml) of raw cow's milk from primary production. Hence, the raw milk samples and locally synthesize white cheese may be considered of bad quality. While the skim milk powder and UHT milk contain fewer amounts of microbial count, the current results also were compatible with the study of (14) who reported the presence of bacteria isolated from raw milk, skim milk powder and UHT milk in Egypt and found that the mean counts of total viable count ranged between logs 5.06 and 8.03 cfu/ml in raw milk samples, RM samples were containing highly bacterial levels, also as shown in Table (2) aerobic spore-forming bacteria count ranged between 1.1*103 cfu/ml in in skim milk powder to 6.7*103 and 3.7*103 cfu/ml in white cheese and raw milk samples respectively. *Bacillus* contamination has been demonstrated to be a problem in the dairy manufacturing process, affecting the quality and safety of the final product. Second, the issue of secondary contamination of heat-treated milk products by spoiling bacteria is now widely known [15, 16, 17]. Also the present study is in line with study of (14) who recorded the aerobic spore-forming bacteria count ranged between <10 and log 3.53 cfu/ml in raw milk samples

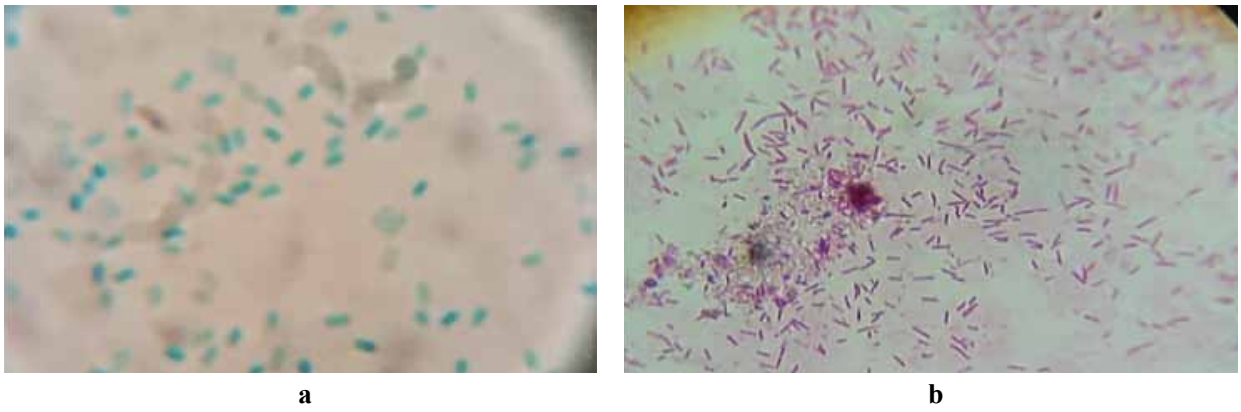
ASB: Aerobic Spore Forming Cell

Characterization and Enzymatic properties of aerobic spore-forming isolates: A total of 25 isolates 10, 8, 3, 4 from "RM, white chees, SMP and UHT milk respectively", were purified and characterized by gram positive, spore forming and motile bacteria, Fig 1 (a, b, c). Biochemical tests were used for detection the enzymatic properties of the of aerobic spore-forming isolates isolated bacteria; the isolates were shown different enzymatic properties. According to the results illustrated in fig (2), it was revealed that the proportion of 96% for total *Bacillus* Spp. isolates were able to hydrolyze the casein, the results were determined as clearing of the agar around the bacterial growth while there are 4% of the isolates was not able to hydrolyze the casein. Furthermore, 60 % of the isolates were ferment lactose, and 40% were determined as lactose non fermenter. The study of enzymatic properties of aerobic spore-forming isolates showed that the isolates have the applet to hydrolyze the casein and fermented lactose, these can cause spoilage in sterilized milk due to their production of proteolytic and lipolytic enzymes or recontamination during the filling of sterilized milk[18]. A finding in accordance with the study of (19) who reported that contamination with spore formers can lead to spoilage of milk and dairy products, mainly caused by enzyme deterioration (proteolytic and lipolytic activity by Bacillus species), acid production, (i.e. lactic, butyric and acetic acid. Moreover, (20), mentioned that the presence of *B. cereus* in UHT milk and 91.67% of mesophilic *Bacillus ssp*. isolates were able to hydrolyze the casein and 36.36% of isolates able to hydrolyze the casein were able to ferment the lactose. The UHT processing of milk destroys all microorganisms that can grow under normal storage conditions[21,22]. Almost all enzymes are also inactivated by UHT processing because the most enzymes in milk are inactivated at temperatures below 100 °C, but some bacterial proteinases and lipases needs temperatures above 150°C for inactivation[23].



a **b**

c

Fig. 1: a: Gram staining, b: spore staining, c: motility test

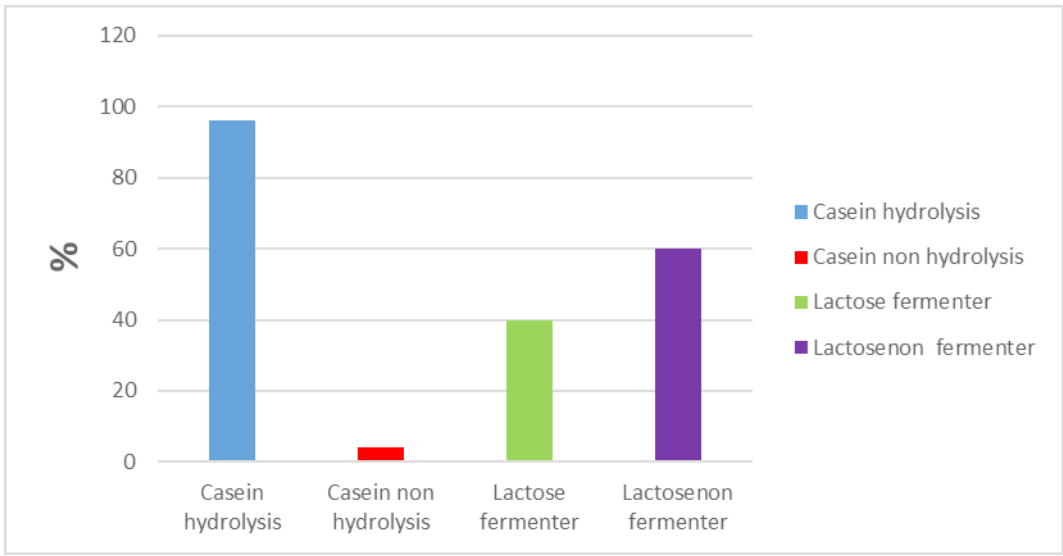


Fig (2): The Percentages of Casein hydrolyses and lactose fermenter isolates

The results showed that all the isolates were positive for Catalase test and have variable activity for blood hemolysis activity 44% blood hemolysis, 48% non-blood hemolysis and 8 % variable in hemolysis activity.

Biochemical identification of Bacteria using Vitek-2 System: Aerobic spore forming isolates were biochemically identified using vitek-2 system version: 07.01 according to the following test, AMY, APPA, LeuA, AlaA, Drib, NOVO, Draf, OPTO, PIPLC, CDEX, ProA, TyrA, ILATk, NC6.5, O129R, Dxyl, AspA, BGURr, Dsor, LAC, d MAN, SAL, ADH, BGAR, AGAL, URE, NAG, dMNAE, SAC, BGAL,

AMAN, PyrA, POLYB, dMAL, MBdG, dTRE, AGLU, AMAN, PyrA, POLYB, dMAL, MBdG, dTRE, AGLU, PHOS, BGUR, dGAL, BACI, PUL, ADH2s. The result for 25 isolates were presented in figure (3), there are 28% isolates were identified *Bacillus subtilis,* 24% isolates were identified as *Bacillus ceruse* and *Bacillus thuringiensis,* 8% isolates were identified as *Bacillus licheniformis* while 16% isolates were unidentified.

The preliminary identification of aerobic spore forming isolates was performed and the results indicated that morphological characteristics of isolates were bacilli. The Gram staining techniques showed that all isolates were gram positive and from the Catalase test all isolates were found to be positive. The selected organisms were identified using VITEK 2 system imparts an automated, computer based technique of species identifications, relies on advanced colorimetry technology, the measurement of light attenuation associated with each biochemical reaction in VITEK cards. The reagent cards have 63 wells and each well contain an individual test substrate. Substrates assess various metabolic activities such as alkalinisation, acidification, enzyme hydrolysis, and growth in the presence of inhibitory compounds. The VITEK-2 compact system combines several advantages like rapid identification, a simple methodology, high level of automation and taxonomically updated databases.

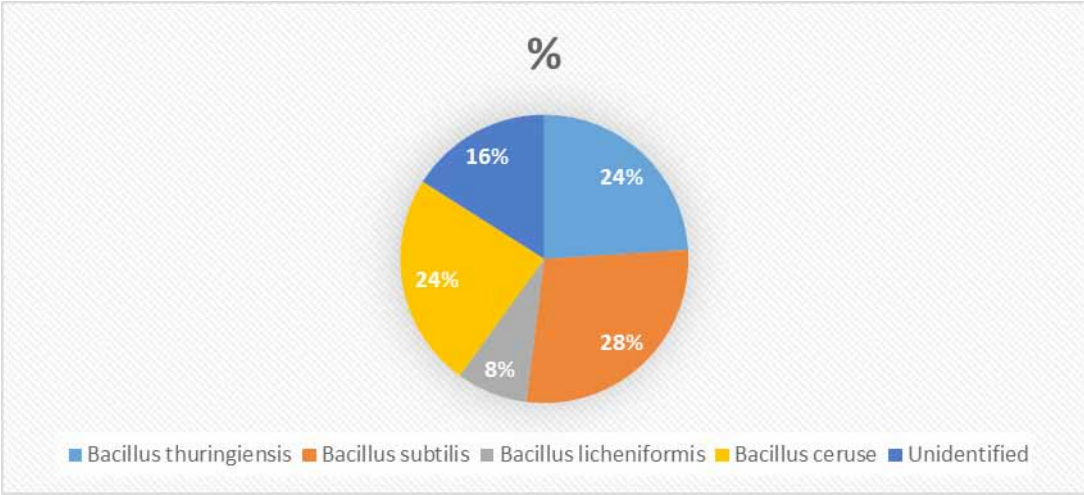

Figure (3) Results of microbial identification using VITEK 2 system

Antibiotic susceptibility test: Among the variety of antibiotics tested, the aerobic spore-forming isolated bacteria show resistance to Cadazolid (CDZ) and Chloramphenicol (C) and Show medium sensitivity for Tetracycline (TE), Erythromycin (E) and Vancomycin (VA), its show highest sensitivity to Ciprofloxacin (CIP) and Cephalexin (CN) (Table 3).

Table (3) Antibiotic susceptibility test of the isolated bacteria

Identified species	Mean of Diameter of inhibition						
	CDZ	C	VA	CN	TE	E	CIP
Bacillus thuringiensis	0	0	±13.2	±25.66	±15	±18.9	±27.66
Bacillus subtilis	0	0	±16.1	±27	±15	±20.2	± 25
Bacillus licheniformis	0	0	±19	±28.33	±20	±22.3	±31.66
Bacillus ceruse	0	0	±13	±26.32	±10.9	±13	±25.3

In conclusion, raw milk, skimmed milk powder and some of UHT milk samples were contaminated with aerobic spore forming bacteria. *Bacillus subtilis* was the highest isolates from Bacillus species. There were differences among isolates in ability to hydrolyze the casein and ferment lactose.

Counseling with Tooth Brushing Demonstration Method as an Effort to Improve Tooth Brushing Skills and the Status of Dental and Oral Hygiene in Early Childhood at School

Ngatemi[1], Tedi Purnama[1]

[1]*Assistant Professor, Department of Dental Health, Health Polytechnic of Jakarta I, Indonesia*

Abstract

Dental health problems suffered by many people in Indonesia is dental caries. Poor dental and oral hygiene is one of the factors causing dental caries or oral and dental health problems. Teaching oral health with demonstration method can improve tooth brushing skills and reduce oral and dental hygiene in early childhood. This study aims to the effectiveness of counseling with brushing demonstration method as an effort to improve tooth brushing skills and the status of dental hygiene in early childhood in school. Method: this study used a quasy experiment with a pretest and posttest with one group design. This research was conducted at Kindergarten Dharma Putra Nusantara 86 Cilandak District, South Jakarta City. Independent variable: counseling by demonstration method and the dependent variable: brushing skills and the status of early childhood dental and oral hygiene. Data were tested using Wilcoxon. Results: counseling with a tooth brushing demonstration method was effective in improving brushing skills ($p < 0.001$) and effective in improving the status of early childhood dental and oral hygiene ($p < 0.001$). Conclusion: Counseling with the demonstration method of tooth brushing is effective as an effort to improve tooth brushing skills and the status of dental and oral hygiene in early childhood at school.

Keywords: *Tooth brushing demonstration method,brushing skills, the status of dental and oral hygiene.*

Introduction

The goal of health development is the creation of Indonesian people who live and behave in a healthy environment and are able to reach quality health services. On the other hand, health services provided throughout Indonesia must be carried out fairly, evenly and optimally. Health development is directed at increasing the awareness, willingness and ability to live a healthy life for everyone so that the highest degree of public health can be realized.[1,2] Healthteeth are an integral part of general health. Besides teeth is one of the digestive organs that plays an important role in the process of masticating food. Dental and oral hygiene maintenance is one of the efforts to improve health so as to prevent various oral diseases.[3]

Dental and oral health problems can occur in adults and children. However, children are more vulnerable to these problems, especially post-school children. This is evidenced by the results of the 2018 Basic Health Research reports that 93% of early childhood aged 5-6 years experience dental health problems; with a national deft value of 8.43, it means that the average number of tooth decay is 8 to 9 teeth per child. The high rate of dental and mouth disease is currently very much influenced by several factors, one of which is the behavioral factor of the people who are not yet aware of the importance of maintaining oral health. It is seen that the brushing behavior of the population aged ≥ 3 years by 2.8% behaves to brush teeth properly.[4, 5]

Dental plaque is a soft, colorless sediment and contains a variety of bacteria that are firmly attached to the tooth surface. Plaque cannot be cleaned by gargling,

e-mail: tedypurnama23@yahoo.com

water spray or air, but plaque can only be cleaned mechanically. Until now the most effective mechanical way to clean plaque is by brushing teeth.[6]

The ability to brush your teeth properly and correctly is a fairly important factor for dental and oral health care. Rubbing teeth namely the simple action of removing plaque and food scraps with a brush and toothpaste, because plaque and food scraps are the main cause of dental caries.[7, 8]

Poor dental and oral hygiene is one of the factors causing dental caries or oral and dental health problems. Poor oral hygiene causes plaque accumulation which contains various kinds of bacteria including the bacterium Streptococcus mutans as the main cause of caries. Zulfikri research (2017) shows the status of dental and oral hygiene of children with moderate criteria totaling 31 people (51.7%), with poor criteria 29 people (48.3%), and very good criteria totaling (0%) and good criteria (0%) because there are no students who have very good criteria and good criteria.[9, 10]

Efforts to maintain oral health and the development of dental health, especially in school children, need special attention because at this age children are undergoing a process of growth and development that will affect the development of dental health in later adulthood. Through the counseling program it is expected that the target can increase the knowledge criteria and make aware of the importance of maintaining oral health and be able to actively participate in improving self-care efforts.[11]

The choice of demonstration method in oral and dental health education supports the improvement of children's understanding, by directly practicing the right way to brush their teeth. Demonstration method is one of the challenging method for children because it can satisfy a child's great curiosity about something that is learned and wants to be known. This demonstration method is also right for children because it matches the concrete style and way of thinking and enhances more critical thinking. Ilyas research (2012) shows that there is an effect of dental and oral health counseling with demonstration method on decreasing plaque scores in children.[6, 12]

Based on background above author interested in conducting research with the title "Counseling with brushing demonstration method as an effort to improve tooth brushing skills and dental hygiene status in early childhood at school"

Research Methodology

The method used in this research is quasy experiment with pre and post-test design with one group design. The study was conducted at Kindergarten Dharma Putra Nusantara 86 Cilandak District, South Jakarta City during February 2020. The research sample was taken with a total sampling technique, as many as 40 students. The independent variable in this study was demonstration of tooth brushing demonstration and the dependent variable was the ability to brush teeth and the exclusion status of preschool children.

Data collection on tooth brushing skills was measured by brushing teeth, validity and reliability tests had been carried out by the same researchers who examined tooth brushing skills. Dental hygiene status was measured by a standard dental hygiene examination that is the PHP-M index.[13] Stages of activities are as follows: pre-test by observing brushing and checking the status of children's dental hygiene, then intervening for 5 days in the form of counseling with a demonstration method of brushing teeth and practice brushing teeth at school every day and finally post-test by observing brushing teeth and check the child's dental hygiene status to see the changes. The research data uses ratio scales and statistical tests, because the data are not normal using Wilcoxon.

Result

Table 1. The mean value of tooth brushing skills and dental and oral hygiene status

No.	Variable	Mean	SD	Min-Max
1	**Tooth brushing skills**			
	Pre-test	5.67	1.298	4-9
	Post-test	8.87	0.596	8-10
2	**Dental and oral hygiene status (PHP-M)**			
	Pre-test	31.95	9,686	16-59
	Post-test	19.45	7,980	10-45

Table 1. Shows the average value of children's tooth brushing skills increased from 5.67 to 8.87 and the value of dental and oral hygiene status decreased from 31.95 to 19.45

Table 2. Test data normality

No.	Variable	Pre-test	Post-test
1	Tooth brushing skills	0.002	0,000
2	Dental and oral hygiene status	0,000	0,000

*Kolmogorov-Smirnov

Based on table 2 shows the normality of tooth brushing skills and dental and oral hygiene status p-value <0.05, meaning that the data is not normally distributed so non-parametric tests.

Table 3. Test the effectiveness of tooth brushing skills and dental and oral hygiene status before and after counseling interventions with the brushing demonstration method

Variable		Mean+SD	P-value
Tooth brushing skills	Pre-test	5.67+1,298	0.001
	Post-test	8.87+0.596	
Dental and oral hygiene status	Pre-test	31.95+9,686	0.001
	Post-test	19.45+7,980	

*Wilcoxon

The results of the effectiveness of tooth brushing skills before and after treatment showed that the p-value was 0.001 (p <0.05) meaning that counseling with a tooth brushing demonstration method effectively improved the brushing skills of early childhood teeth in school and the status of dental and oral hygiene status p-value is 0.001 (p <0.05) meaning that counseling with a brushing demonstration method is effective in reducing the status of dental and oral hygiene in early childhood.

Discussion

The results of the study of dental and oral hygiene status before counseling with the demonstration method of brushing teeth obtained an average value of dental and oral hygiene status of 31.95 including the medium category. In line with Pantow research (2014), the mean plaque index value before counseling using the brushing demonstration method was 1.53 in the medium category.

This is because early childhood children do not yet have the ability to brush their teeth properly proven the average value of children's tooth brushing skills of 5.67, including the category of less skilled, so that it affects the cleanliness of teeth and mouth. Strengthened Arianto et al (2014), states that brushing their teeth properly and correctly can affect the status of dental and oral hygiene.[7,14]

Then the respondent is given an intervention, the first step is to introduce the tooth brushing equipment along with the storage area stored in the school environment. The response of the sample in initiating more enthusiasm and enthusiasm, means that the stimulus given to the child was successfully seen by the child's ability to retrieve and store it easily. Purnama (2019) states that the provision of school toothbrush storage model facilities in the form of toothbrushes and toothpaste and gargle glasses in person so that children find it easier to take and store toothbrushes without the help of others.[8]

Researchers conducted counseling and demonstrations to brush their teeth using phantom media. For children, how to brush teeth need to be given an example of a good model and with the simplest technique possible. Delivery of dental and oral health education to children must be made as attractive as possible, including through attractive counseling without reducing the content of education, demonstrations directly. The choice of demonstration method in oral and dental health education supports the improvement of children's understanding, by directly practicing the right way to brush their teeth.[6] Furthermore, respondents do tooth brushing exercises every day for 5 consecutive days, this is in line with Research Pujiyasari (2015) the method of brushing teeth for 4 times can increase the independence of brushing your teeth. Makuch (2011) statement is also reinforced that the method of brushing teeth can be applied to teach preschoolers' brushing skills.[15, 16]

The results of the effectiveness test of tooth brushing skills and after being treated showed that the p-value was 0.001 (p <0.05) meaning that counseling with a tooth brushing demonstration method was effective in improving brushing skills in early childhood at school. This also justifies the opinion expressed by Ilyas (2012) demonstration method on oral health counseling to support increased understanding of children, by practicing directly how to brush teeth correctly.[6]

This success was also seen in the improvement of the child's dental and oral hygiene status. The results of the effectiveness test of oral and dental hygiene status and after being treated showed that the p-value was 0.001 (p <0.05) meaning that counseling with a tooth brushing demonstration method effectively improved the status of dental and oral hygiene in early childhood at school. The dental and mouth hygiene status scores decreased because they were given treatment in the form of counseling using a demonstration method about oral health, especially how to brush teeth correctly so that with this counseling, students will increase their knowledge so they are able to practice the right teeth brushing. The practice of brushing your teeth

properly will be able to remove plaque. Purnama et al (2019), proving that brushing your teeth with the right techniques will improve your brushing skills and clean teeth and mouth. Ilyas (2012) also proved the promotion of dental and oral health with a demonstration method for decreasing dental and oral hygiene scores.[6, 8]

Conclusion

Based on the results of the study, it can be concluded that:

1. Counseling with demonstration method proved significantly ($p < 0.001$) effectively improve early childhood toothbrushing skills in school.
2. Counseling with demonstration method proved significantly ($p < 0.001$) effectively improve the status of dental hygiene in early childhood

Abstract

Smoking behavior in women has a risk of fertility problems, the reproductive system, and many other health problems. This study was aimed at analyzing the effect of education level on smoking behavior among female workers in Indonesia. The samples used were a female worker. The sample size was 51,815 respondents. Apart from education, other independent variables analyzed were the place of residence, age, marital, wealth, and pregnant status. Determination of determinant by binary logistic regression. The results of the study informed that female workers with primary education were 0.456 times more likely than no education to become smokers. Female workers with secondary education are 0.428 times more likely than no education to become smokers. Female workers with higher education are 0.219 times more likely than no education to become smokers. The results of this analysis indicate that the higher the education level, the lower the possibility of female workers becoming smokers. Apart from the education level, 4 other variables were also found as predictors of smoking behavior among female workers, namely the place of residence, age, wealth, and pregnant status. It was concluded that the education level was a predictor of smoking behavior among female workers in Indonesia. The higher the education level, the lower the possibility of female workers becoming smokers.

Keywords: *Smoking behavior, female worker, tobacco use.*

Introduction

It is reported that female smokers worldwide reach 250 million people, 22% in developed countries, and 9% in developing countries[1].Several countries reported a complete reversal in relative prevalence between men and women, accompanied by a shrinking gap between male and female smokers in adulthood[2]. This condition shows that smoking behavior in women globally can change significantly in the future[2]. In line with the increase in female smokers, it was found that female smokers were at greater risk of experiencing pain due to tobacco use than men. Female smokers are at risk of developing breast, fibroid, and lung cancer[3,4]. Some female smokers reported not stopping smoking while pregnant[5]. Screening results in female smokers showed positive depression at early pregnancy, late pregnancy, and 12 months after delivery[5]. Quitting smoking especially early in pregnancy is associated with a reduction in preterm birth[6]. Besides, smoking also has adverse effects on the reproductive system, increased risk of infertility, stillbirth, sudden death syndrome, and intrauterine fetal growth disorders[7].

Corresponding Author:
Nikmatur Rohmah
Lecturer, Faculty of Health Science, Muhammadiyah University of Jember East Java Indonesia
e-mail: nikmaturrohmah@unmuhjember.ac.id

Most of the smokers are female workers. Female smokers working in Indonesia are reported to be 66.2%[8], in Iran 27.7%[9], and Brazil 40.3%[10]. 7.3% of female smokers in Brazil still smoke during pregnancy[10]. Women who smoke in China are reported to have poor education and socioeconomic[8]. A Canadian study of female smokers reported that female smokers were more likely to continue smoking during pregnancy which was associated with education and employment status[11]. Meanwhile, in Bangladesh, it was also reported that 51.0% of smokers were women, and 33.6% worked in various sectors[12].

Female workers are one of the seven vulnerable groups. Some of the vulnerabilities of female workers that occur in the European Union include discrimination in workgroups, sexual harassment, lack of concern for reproductive health, including menstruation leave and pregnancy[13]. Vulnerabilities in female reproduction include not being allowed to get pregnant while working, not having a baby during the contract period, greater wage discrimination for men, including work benefits, such as children and family, less than maximum menstrual and pregnancy leave, harassment, and sexual violence[14]. The psychological vulnerability of female workers is 30.8% higher than that of men. Psychological vulnerabilities can take the form of bullying, anxiety, stress, mental badness, and depression[15].

Working women show an important aspect in the macro economy[16],but it is also a challenge that women must face. Working women have a double burden, namely as workers outside the home and workers in the home[17]. World Bank data shows that the percentage of female workers in 2018 was 50.7%, and those aged 15 years and over. This data forms the basis that women have a role in the family economy[18]. The dual roles of female workers include caring for their children, being mothers, partners as well as being members of society. This condition affects emotional health, physical health, social and economic activities[15]. Based on the background description, the study was aimed at analyzing the effect of education level on smoking behavior among female workers in Indonesia.

Materials and Method

Data from the 2017 Indonesian Demographic Data Survey (IDHS) was used as material for analysis in this study. The unit of analysis in this study was female workers (15-49 years) in Indonesia. The 2017 IDHS used stratification and multistage random sampling, so it got 51,815 respondents.

Smoking behavior is the respondent's recognition of his smoking behavior. Divided into 2 categories, namely no smoking and smoking. Apart from the education level, other independent variables analyzed were the type of place of residence, age groups, marital status, wealth status, and pregnant status.

All variables involved in the analysis of this study were dichotomous variables, therefore the chi-square test was used to examine the relationship between education level and other variables. In the final stage, binary logistic regression is used because of the nature of the dependent variable. All statistical analyzes were carried out using SPSS 22 software.

Results and Discussion

Table 1 displays descriptive statistics of female workers in Indonesia. It can be seen that all categories of education level are dominated by female workers who don't smoke. Based on the education level, primary and no education female workers are predominantly living in rural areas, while female workers with secondary and higher education levels are predominantly living in urban areas.

Based on the age group, primary and no education female workers are dominated by the 45-49 age group, while female workers with secondary and higher education levels are dominated by the 35-39 age group. All-female workers are dominated by those who are married or living with partners.

Based on wealth status, primary and no education female workers were dominated by the poorest, while female workers who had education at the secondary category level were dominated by the richer, and female workers who had education at the higher category level were dominated by the richest. Based on variable status, all-female workers were dominated by those who were not pregnant.

Table 2 shows the results of the binary logistic regression of smoking behavior among female workers in Indonesia. It can be seen that female workers with primary education have a 0.456 times chance compared to no education female workers to become smokers (OR 0.456; 95% CI 0.393-0.529). Female workers with secondary education are 0.428 times more likely than

no education female workers to become smokers (OR 0.428; 95% CI 0.366-0.501). Female workers with higher education are 0.219 times more likely than no education female workers to become smokers (OR 0.219; 95% CI 0.171-0.279).

The results of this analysis indicate that the higher the education level, the lower the possibility of female workers becoming smokers. The better the level of education, the more female workers understand the risk of behavior that will be adopted in their daily lives. This condition makes education level often found as a positive predictor of output in the health sector[8,19,20]. On the other hand, low levels of education are often found to be a barrier to output in the health sector[21,22].

Apart from the education level, 4 other variables were also found as predictors of smoking behavior among female workers. First, based on the type of place of residence, it was found that female workers living in rural were 0.643 times more likely than female workers living in urban to become smokers (OR 0.643; 95% CI 0.588-0.704). This information shows that female workers who live in urban have a higher likelihood of becoming smokers. The same findings were also confirmed in several previous studies[23,24].

Age group of respondents: 40-44	0.059	1.975	0.976	3.997
Age group of respondents: 45-49	*0.032	2.168	1.071	4.387
Wealth status: Poorest	-	-	-	-
Wealth status: Poorer	***0.000	0.771	0.692	0.859
Wealth status: Middle	***0.000	0.523	0.460	0.595
Wealth status: Richer	***0.000	0.483	0.421	0.554
Wealth status: Richest	***0.000	0.481	0.414	0.560
Pregnant: No	-	-	-	-
Pregnant: Yes	*0.028	0.723	0.542	0.965

Note: $^{*}p < 0.05$; $^{**}p < 0.01$; $^{***}p < 0.001$.

Second, the results of the analysis found that the age group had a partial effect on smoking behavior among female workers. Female workers in the 35-39 age group were 2.140 times more likely than female workers in the 15-19 age group to become smokers (OR 2.140; 95% CI 1.057-4.330). Female workers in the 45-49 age group were 2.168 times more likely than female workers in the 15-19 age group to become smokers (OR 2.168; 95% CI 1.071-4.387). Previous studies in Costa Rica, Iran, and Cuba also informed the same finding, that age is a predictor of smoking behavior[23,25,26].

Third, wealth status. Female workers with poorer wealth status have a probability of 0.771 times compared to the poorest female workers to become a smoker (OR 0.771; 95% CI 0.692-0.859). Female workers with middle wealth status have a 0.523 times chance compared to the poorest female workers to become smokers (OR 0.523; 95% CI 0.460-0.595). Female workers with richer wealth status have a 0.483 times chance compared to the poorest female workers to become smokers (OR 0.483; 95% CI 0.421-0.554). The richest female worker was 0.481 times more likely than the poorest female worker to become a smoker (OR 0.481; 95% CI 0.414-0.560). This information is in line with the findings of the previous studies[27].

Fourth, pregnant status. Pregnant female workers had 0.723 times the probability of non-pregnant female workers becoming smokers (OR 0.723; 95% CI 0.542-0.965). This means that pregnancy is a protective factor to prevent female workers from smoking.

Conclusions

Based on the analysis, it can be concluded that education was a predictor of smoking behavior among

female workers in Indonesia. The higher the education, the lower the possibility of female workers to become smokers. Apart from education, 4 other variables were also found as predictors of smoking behavior among female workers, namely type of place of residence, age group, wealth status, and pregnant status.

Biostatistics Evaluation of Women Breast Lesions in Baghdad/Iraq

Noor F.M. Ali[1], Hiba A. Abdul Sattar[2], Mervet Abd-alhassan[3], Fathaa Abdullah Mahmoud[4], Munya H. Sabri[5]

[1]College of Pathological Analysis Technique/Al- Bayan University, Baghdad, Iraq, [2]College of Medical Lab Techniques/Osol Aldeen University College, Baghdad, Iraq, [3]College of Pathological Analysis Technique/Al-Bayan University, Baghdad, Iraq, [4]College of Pathological Analysis Technique/Al-Bayan University, Diyala, Iraq, [5]Al-Elwiyah Educational Hospital, Baghdad, Iraq

Abstract

Background: Breast lesions are a basic term for a benign or malignant tumor or bump in the breast. This study is aimed to evaluate the biostatistics range of the malignant lesions in women breast in Baghdad/Iraq and compared it with other types of breast lesions by using ultrasound in diagnoses.

Method: The study is done on 1494 of women patients from different ages and screened through six months in Al-Elwiya Educational Hospital in Baghdad/Iraq, by using ultrasound machine to diagnosis of the breast lesion type's and divided it into groups (normal, benign, suspected and malignant).

Conclusion: Our result showed **horizontally** significant differences (P≤0.01),(P≤0.05) in groups of (normal, Begnin, suspected) in percentages about (35.94%), (30.79%), (32.20%) respectively. Except of malignant group has no significant differences and percentage about (1.07%) throughall months. And **vertically** our result showed high significant differences (P≤0.01) between all the studied groups (normal, benign, suspected, and malignant) and percentages was (35.94%, 30.79%, 32.20%, and 1.07%) respectively. That means there is little case of malignant lesion significantly improved by ultrasound,because all the suspicious breast lesions detected by ultra-sound should be biopsied in histologic results to confirm or exclude the presence of malignancy.

Keywords: *Breast, lesion, tumor, benign, malignant, suspected, ultrasound.*

Introduction

The tumor (also known as a neoplasm) is an abnormal mass of tissue that may be solid or fluid-filled. In general, tumors are divided into three groups:[1,2]

- **Benign:** These are not cancerous, not harmful and cannot spread. A benign tumor will remain in its current form. They do not generally return after being removed.
- **Premalignant:** A premalignant tumor is not yet cancerous but appears to be developing the properties of cancer. It's required close monitoring.
- **Malignant:** Malignant tumors are cancerous. They can grow quickly, spread, and can potentially result in death.

Breast tissue is heterogeneous, associating connective and glandular structures, which grow and change cyclically under hormonal regulation. Hormones are also thought to be the main determinant of the major benign and malignant pathologies encountered in the breast. Benign lesions are more frequent and fibrocystic changes are by far the most common among them. They usually associate different entities, (adenosis, fibrosis, cysts and hyperplasia) but vary in intensity and extension.

Thus, their clinical and radiographic presentation is extremely different from one patient to another.[3]

Breast cancer is regarded as one of the most frequent mortality causes among women. As early detection of breast cancer increases the survival chance. Breast cancer symptoms vary widely — from lumps to swelling to skin changes—and many breast cancers have no obvious symptoms at all.[4, 5]

Ultrasound is safe, painless and widely used. It produces pictures of the inside of the body using sound waves. Ultrasound imaging is also called ultrasound scanning or sonography. Ultrasound exams are Noninvasive and does not use radiation (like X-rays) that helps physicians diagnose and treat many of medical conditions. The images are captured in real-time; so they can show the structure and movement of the body's internal organs. They can also show blood flowing through blood vessels. When an ultrasound examination reveals a suspicious breast abnormality, a physician may choose to perform an ultrasound-guided biopsy.[6]

Materials and Method

1494 of women patients from different ages were screened through six months (beginning from January/2019 till the end of June/2019) in Al-Elwiya Educational Hospital in Baghdad/Iraq, all were viewed by using ultrasound machine (MEDISON SONOACE 8000 Live prime) to diagnosis of the breast lesion type's and divided it into (normal, benign, suspected and malignant).

The ultrasound machine produces pictures of the internal structures of the breast by using sound waves. It uses a small probe called a transducer and gel placed directly on the skin of breast. High-frequency sound waves travel from the probe through the gel into the breast. The probe collects the sounds that bounce back. A computer uses those sound waves to create an image.

Ultrasound imaging can help to determine whether a new breast lump is a solid (which may be a non-cancerous tumor or a cancerous tumor), fluid-filled (such as a benign cyst) or both solid and cystic.[7]

High-quality images of the normal and abnormal breast can be obtained with modern ultrasound equipment. At the minimum, a 7.5 MHz linear array probe should be used, through digital broadband-width transducers using higher frequency (mid-range exceeding 7.5 MHz) are widely available and allow higher resolution imaging. The patient is examined in the supine oblique position. The side being examined is raised and the arm placed above the head to ensure that the breast tissue is evenly distributed over the chest wall. In addition to conventional orthogonal scanning direction, scanning in the radial and antiradial planes are of value in demonstrating ductal abnormalities. [8, 9]

Statistical Analysis: The Statistical Analysis Systemprogram was used to detect the effect of difference factors in study parameters. Chi-square test was used to significant compare between percentage (0.05 and 0.01 probability) in this study.[10]

Results and Discussion

Our results in **1494** patient screened will explained in two ways:

First: Horizontally: According to the table (1) the column of normal group has high significant differences ($P \leq 0.01$) in percentage about (35.94%) through all months, the highest percentage was in January (44.90%), the lowest percentage in June (26.91%).

The column of benign group has significant differences ($P \leq 0.05$) in percentage about (30.79%) through all months, the highest percentage was in January (37.24%), the lowest percentage in April (26.16%).

The column of suspected group has high significant differences ($P \leq 0.01$) in percentage about (32.20%) through all months, the highest percentage was in June (40.36%), the lowest percentage in January (17.86%).

The column of malignant group has no significant differences in percentage about **(1.07%)** through all months.

Second: Vertically: The table below showed high significant differences ($P \leq 0.01$) between all the studied groups (normal, benign, suspected, and malignant) was (35.94%, 30.79%, 32.20%, and 1.07%) respectively. The highest percentage was in normal cases (35.94%), but the lowest percentage was in malignant cases (1.07%). That means there is little case of malignant lesion diagnosed by ultrasound.

Table (1): Total Number of patients that are diagnosed in all the Six month (from January 2019 to June 2019) and classified to (normal, benign, malignant, and suspected)

Months	Total patients	Total No. of Normal	Total No. of Benign	Total No. of Suspected	Total No. of Malignant	Chi-Square (χ^2)
January	196(13.12%)	88(44.90%)	73(37.24%)	35(17.86%)	0(0.00%)	11.641**
February	281(18.81%)	112(39.86%)	95(33.81%)	70(24.91%)	4(1.42%)	9.836**
March	261(17.47%)	88(33.72%)	75(28.73%)	88(33.72%)	10(3.83%)	9.107**

Total summary						
All Six months	1494	537(35.94%)	460(30.79%)	481(32.20%)	16(1.07%)	9.761**

*(P≤0.05), ** (P≤0.01)

Discussion

Horizontally, our results in all six months showed significant differences (P≤0.01 & P≤0.05)of normal, benign and suspected cases group except the malignant that showed no significant differences because of the Variable consequences depending on the applied techniques used, as well as their diagnostic measures. Additionally, thickness, lesion size, shape of breast that affected on ultrasound for differentiation of normal, benign, suspected and malignant breast lesions. And this finding is agreed with.[11]

Malignant lesions that are soft, like: mucinous carcinomas, necrotic tumors, and ductal carcinoma in situ, may be false diagnosed as benign, and benign conditions that are stiff, such as: scarring, fibrosis, and complex fibroadenomas, may be misjudged as malignant. And this result is fixed with[12,13 and 14].

Vertically, the results showed high significant differences (P≤0.01) between all the studied groups (normal, benign, suspected, and malignant). The highest percentage was in normal cases (35.94%), but the lowest percentage was in malignant cases (1.07%). That means there is little case of malignant lesion significantly improved by ultrasound, because all the suspicious breast lesions detected by U/S should be biopsied in histologic results to confirm or exclude the presence of malignancy. And all that is agreed with.[15]

Conclusion

At the end, our study of Biostatistics evaluation of women breast lesions in Baghdad/Iraq showed that breast thickness (lesion size, lesion depth, lesion location and pathologic finding)are factors influencing the image quality at ultrasound, with sensitivity for the classification of benign and malignant masses improving with higher quality scores. And all the suspicious breast lesions detected by ultrasound should be biopsied in histologic results to confirm or exclude the presence of malignancy.

Strategies of Carious Tissue Removal in Deep Carious Lesions among Dentists in Iraq: Online Based Survey Study

Noor H. Fadhil[1], Anas F. Mahdee[2], Ahmed H. Ali[3]

[1]Assistant Lecturer, [2]Assistant Professor, [3]Lecturer, Department of Aesthetic and Restorative Dentistry, College of Dentistry, University of Baghdad, Baghdad, Iraq

Abstract

The aim was to find out the preferences of dentists in Iraq regarding strategies of carious tissue removal in management of deep carious lesions (CR) in asymptomatic teeth and how demographics (sex, years of experience, qualification, specialty, place of work) influences these preferences. An online questionnaire of two months duration was constructed and distributed randomly via social media (Facebook). The questionnaire' questions investigated the demographics, CR (included non-selective removal to hard dentine (NS), stepwise (SW) and selective (SE) removal). 238 dentists participated in the study, 164 (69%), 56 (23.5%) and 18 (7.5%) of respondents prefer NS, SW and SEremoval, respectively. Significantly both GDP and males prefer NS more than Endodontists and females ($P<0.05$), Percent of respondents work in private clinics who perform non-selective removal (53.6%) significantly lower than those who work in hospitals (73.6%) ($p<0.01$). less invasive CR significantly associated with being an endodontist or female or work in a private clinic (OR=2.02, CI 95% 1.02-4.0), (OR=2.04, CI 95% 1.12-3.7) and (OR=2.1, CI 95% 1.0-4.0), respectively. In conclusion Iraqi GDPs prefer invasive strategy of carious tissue removal in management of deep carious lesions. Specialty, place of work and sex of respondents affected these choices significantly.

Keywords: *Selective, stepwise, deep carious lesion, dentists, attitude.*

Introduction

The treatment of deep dentin caries is a daily practice for most dentists worldwide. However, there is no consensus in the dental profession regarding the best practice protocol, excavation technique, treatment option in the event of pulp exposure or suitable materials after pulp exposure. Traditionally removal of all heavily contaminated and demineralized dentin in deep carious lesions (non-selective carious tissue removal to hard dentine) was the aim of dentists in the case of treatment of deep carious lesion[1], this procedure may result in a pulpal exposure often. Therefore, attention has brought to a more minimal invasive method such as stepwise removal and selective removal (to leathery dentin), which shows higher success rates and lower risk of pulp exposure compared to non-selective removal to hard dentine[2,3]. In these removal techniques, all peripheral carious dentine is removed leaving some carious tissue over the pulp wall before permanent restoration in case of selective removal at the same visit [4], but re-entry is needed in stepwise removal to remove the remaining soft dentine before permanent restoration after temporarily sealing period. Higher success rate of the selective removal compared to stepwise removal reported, suggesting no need for re-entry [3, 5].

There is no existing data regarding how dental professionals manage deep carious lesions in Iraq, the aim of this study was to investigate the preference of strategies of carious tissue removal in management of deep carious lesions by the dental practitioners in Iraq and how the respondents' demographic variables (sex, years of experience, qualification, specialty, place of work) influences these decisions.

Materials and Method

An online questionnaire was designed and piloted through staff members at College of Dentistry/University of Baghdad. A sample size calculation was carried out through population for descriptive sampling technique with an expected response rate between 60 and 80 and 80% power calculation. Hence, 350 dentists were needed to respond. Online questionnaire was constructed using Google form, A section of the questionnaire constructed as a cover letter explaining the purpose of the questionnaire and emphasis on anonymity. The questionnaire questions investigated:

1. Demographics of respondent which included: sex, years of experience, qualification (BDS, Diploma, MSc and PhD), specialty (Endodontists, general dental practitioner (GDP) and other specialty (referred to as "other")), place of work (private clinic or hospital).
2. Carious tissue removal technique (non-selective vs stepwise vs selective removal) in deep carious lesions in asymptomatic teeth.

The questionnaire was sent electronically via social media (Facebook) with respondents completing the form anonymously. The distribution was performed through mailing to members of certain Iraqi Dental Facebook groups which were assigned using a simple randomization-lottery method to minimize bias in selection. The issue with respondents making more than one entry was excluded by using an IP-protection protocol. The respondents were asked to choose one suitable answer for each question. Ethical approval was considered unnecessary as there was no patient information included, only dentists were asked about their preference. Responses in the Google form gathered as Excel sheet. The collected data was analyzed using the statistical package SPSS 26 (SPSS Inc., Chicago, IL, USA). Descriptive statistics given as frequencies (n) and percent (%). Chi Square test was used to investigate the influence of gender, qualification, specialty, place of work and years of experience on the choice of carious tissue removal strategy and treatment option after pulp exposure. The background characteristic variable was chosen as an independent variable for the binary multivariable logistic regression analysis. Through this, odds ratios (OR) and their confidence intervals (CI) were calculated

Results

Demographic Data: 238 dentists responded in the study. Table 1 shows the demographic characteristics of the respondents in the study.

Table 1: Demographic characteristics of the respondents in the study.

Categories	n (%)
Sex:	
a. Females	100 (42%)
b. Males	138 (58%)
Experience:	
a. Less than 5 years	80 (33.6%)
b. 5-10 years	52 (21.8%)
c. 10-20 years	62 (26%)
d. More than 20 years	44 (18.4%)
Qualifications:	
a. BDS	136 (57%)
b. DIPLOMA	17 (7%)
c. MSc	52 (22%)
d. PhD	33 (14%)
Specialty:	
a. General practitioner	116 (48.7%)
b. Endodontists	58 (24.4%)
c. Other specialties	64 (26.9%)
Place of work:	
a. Private clinic	56 (23%)
b. Hospital	183 (27%)

n (%) = number (percentage) of respondents

Strategy of carious tissue removal in management of deep carious lesion in asymptomatic teeth:

164 (69%), 56 (23.5%) and 18 (7.5%) of respondents choose to use non-selective, stepwise and selective carious tissue excavation in treatment deep carious lesions, respectively, with statistically significant difference between frequencies ($p< 0.001$). Years of experience, age, qualification did not statistically significantly affect the decision of selection of the strategy used to remove carious tissue in deep carious lesions.

Specialty significantly affects the decision of carious tissue removal technique ($p=0.05$). Percent of endodontists who perform non-selective removal (55.2%) significantly lower than those in GDP (72.4%) ($p<0.05$) and Other (75%) ($p<0.05$), respectively.

Significantly higher percent of Endodontists perform stepwise removal compared to GDP ($p<0.05$) and Other ($P<0.01$), respectively. No differences in percentages of respondents who perform selective removal in all categories ($p>0.05$).

Sex significantly affect the decision of carious tissue removal technique ($p=0.026$). Significantly more males (75.4%) use non-selective removal compared to females (60%) ($p<0.05$). Significantly more females (32%) use stepwise removal compared to males (17.4%) ($p<0.01$). There was no significant difference in percentages of respondents who perform selective removal in different sex ($p>0.05$).

Place of work significantly affects the decision of carious tissue removal technique ($p=0.018$). Percent of respondents work in private clinics who perform non-selective removal (53.6%) significantly lower than those who work in hospitals (73.6%) ($p<0.01$). Percent of respondents work in private clinics who perform stepwise removal (35.7%) significantly higher than those who work in hospitals (19.7%) ($p<0.05$). There was no significant difference in percentages of respondents who perform selective removal in private clinics (10.7%) and hospitals (6.5%) ($P>0.05$), as shown in Table 2.

Table 2: Distribution of frequencies and percentages of Strategy of Carious tissue removal among significant demographic categories.

Respondents Categories	Strategy of Carious Tissue removal n (%)			
	Non-selective removal	Stepwise removal	Selective removal	Total
Specialty n (%)				
Endodontists	32(55.2%)[a]	22(37.9%)[b]	4(6.9%)	58(24.3%)
Others	48(75%)[a]	12(18.8%)[b]	4(6.3%)	64(26.8%)
GDP	84(72.4%)[a]	22(19%)[b]	10(8.6%)	116(48.7%)
Total	**164(69%)**	**56(23.5%)**	**18(7.5%)**	**238(100%)**
Sex n (%)				
Females	60(60%)[c]	32(32%)[d]	8(8%)	100(42%)
Males	104(75.4%)[c]	24(17.4%)[d]	10(7.2%)	138(58%)
Total	**164(69%)**	**56(23.5%)**	**18(7.5%)**	**238(100%)**
Place of Work n (%)				
Private clinics	30(53.6%)[e]	20(35.7%)[f]	6(10.7%)	56(23.5%)
Hospitals	134(73.2%)[e]	36(19.7%)[f]	12(6.5%)	182(76.5%)
Total	**164(69%)**	**56(23.5%)**	**18(7.5%)**	**238(100%)**

n= number of respondents, identical superscript small letters represent statistically significant difference among the relevant groups.

For the purpose of statistical analysis via binary multivariable logistic regression, CR categories classified into invasive (non-selective removal) and less invasive (include stepwise and selective caries removal). Results of regression analysis show that being an endodontist or female or work in a private clinic significantly associated with choosing a less invasive carious tissue removal strategy (stepwise or selective removal) in management of deep carious lesions (OR=2.023, CI 1.02-4.0), (OR=2.044, CI 1.12-3.7) and (OR=2.101, CI 1.0-4.0), respectively.

Discussion

With development of minimal invasive approaches in the management of deep carious lesions, it is important to investigate existing dentists' attitude and preferences toward these approaches and to assess the effect of different demographic factors influencing these choices. Therefore, this study is the first to compare and analyses management of deep carious lesions in Iraq. In this study, social media platforms were used to distribute the questionnaire into targeted groups representing the dentist population in Iraq. Rapid and effective sharing of information allowed by social media widely used by the population [6]. Daily, there are 1.52 billion active users of Facebook alone and 2.7 billion subscribers use social

media [7]. This media has been suggested as an alternative way for communications in a survey study involving medical professionals to assess social media use with a response rate of 64% [7]. This study showed a response rate of 68% which is satisfactory and representing the targeted population.

Majority of dentists who surveyed in this study (69%) preferred a non-selective carious tissue removal strategy in management of asymptomatic deep carious lesions and refused to leave caries under restoration. This decision is related to the idea that residual caries might progress and harm the pulp. According to the results, less invasive excavation method (stepwise and selective excavation) were chosen by 31% of the respondents, this result is in agreement with studies in United States and Brazil, reporting that only 21% [8] and 26% [9] of dentists considered incomplete excavation of pulp-proximal caries. Other studies carried out in USA, France, Germany and Brazil showed that majority of dentists (60-70%) preferred non-selective carious tissue removal to the hard dentine in management of deep carious lesions even with high risk of pulp exposure during the excavation procedure [8-10], similar to the results of this study.

Reduced risk of pulp exposure and pulpal complications associated with in complete excavation (selective removal) versus complete excavation (non-selective removal to hard dentine) has been confirmed recently by reviews and meta-analysis [10, 11]. Although the idea of leaving residual caries in proximity to the pulp bears the fear of restoration failure, failure risk did not seem to be increased significantly (OR = 0.97, 95% CI = 0.64–1.46). Therefore, current scientific evidence supports selective removal of caries if the residual carious lesion is sealed successfully with no indication for a considerable risk of progress [12, 13]. Also, recent randomized clinical trial supports the advantage of selective removal of carious tissue in deep carious lesion with symptoms of reversible pulpitis using a self-limiting excavation protocol (Carisolv gel and operating microscope) which maintain 90% pulp survival rate after one year of follow-up utilizing CBCT for radiographic evaluation of periapical health [4]. However long-term follow-up of teeth excavated selectively is limited.

One of the factors that affected preference of carious tissue removal strategy was specialty of the respondent, half of Endodontists prefer less invasive CR compared to GDP and other specialties significantly (Table 2), being an Endodontist increased the probability of choosing less invasive method by 2 times compared to GDPs (OR=2.023, CI (95%)1.02-4.0). This could be explained by the fact that endodontists may become more conscious about the recent clinical guidelines that outline the benefits of less invasive carious tissue removal strategies [11, 14-16].

Also, results of this study show that females prefer a less invasive approach in caries excavation of deep carious lesions (Table 2). The preference of a less invasive carious tissue removal strategy was significantly associated with the gender “female” (OR=2.044, CI (95%) 1.12-3.7). This agrees with another multi-national survey study which found that stepwise removal was performed less often by male dentists [10]. However other studies could not find such association between gender and CR strategy preference [17, 18].

Result of this study found that place of work significantly affects the decision of carious tissue removal technique. work in private clinics strongly associated with choosing less invasive Cr compared to working in hospitals Table 2. This disagrees with results from other studies which found a strong correlation between employment in the public sector and choosing a less invasive strategy [10, 18]. This probably can be explained by lack of local clinical guidelines that promote less invasive carious tissue removal strategies in the public sector compared to the private sector in Iraq which have more diversity and flexibility in terms of time and financial consideration. Also, it seems that treatment decision guided by previous experience and familiarities, for example, dental Under and postgraduate education significantly affect the dentist decision regarding the strategy of carious tissue removal adopted, most Iraqi dental schools teaches the contemporary invasive approach of non-selective carious tissue removal to hard dentine.

In conclusion, majority of the surveyed dentists preferred invasive carious tissue removal strategies in excavation of asymptomatic deep carious lesions. Therefore, benefits of selective excavation should be highlighted in under- and postgraduate education to promote minimally invasive techniques. Less invasive strategies in management of deep carious lesions and vital pulp therapies are not common in clinical practice in Iraq and there is urgent need to educate GDPs the current scientific evidence on less invasive strategies.

Antibiofilm Activity of Nystatin, Aspirin and EDTA Against *Candida albicans* Isolated from Iraqi Women with Vulvovaginitis

Noor Naser Raheem[1], Kais Kassim Ghaima[2]*

[1]Research Scholar, M Sc Student, Kamal Al-Samarrai Hospital, Ministry of Health, Baghdad, Iraq,
[2]Assistant Professor, Institute of Genetic Engineering and Biotechnology for Postgraduate Studies, University of Baghdad, Baghdad, Iraq

Abstract

The vulvovaginitis candidiasis is often associated with biofilm formation by *Candida albicans* and using of antifungal agents against *C. albicans* biofilms is urgently needed. Microtiter plate assay using crystal violet was used for detection the ability of *Candida albicans* to form biofilm and the microtiter broth dilution method was used for determination the minimum inhibitory concentrations (MICs). Out of 42 *Candida albicans* isolated from vulvovaginitis, 37 (88%) can produce biofilm at the varying degrees. Twenty-eight (75.7%) isolates could form a strong biofilm. The results of minimum inhibitory concentrations (MICs) of Nystatin, Aspirin and EDTA (Ethylenediaminetetraacetic acid) against 28 *C. albicans* isolates which formed the strong biofilm, revealed that range of concentrations of Nystatin were (6.25-100 µg/ml), while the MICs of aspirin and EDTA were more than 1000 µg/ml. It was obvious that the Nystatin had the inhibitory activity at the concentrations 6.25 and 12.5 µg/ml. The highest antibiofilm activity by Nystatin were demonstrated at the subinhibitory concentration 50 µg/ml with biofilm eradication percent (75.80%), while the lowest antifungal effect (2.86-10.70%) was at very low concentrations (3.125-6.25 µg/ml). Also, there was an obvious biofilm eradication of Aspirin and EDTA at the concentrations 500 and 1000 µg/ml but the effect of aspirin at the concentration 1000 µg/ml (70.51%) is more than EDTA (60.12%) in contrast with the concentration 500 µg/ml, it was found that the effect of EDTA (51.29%) is more than aspirin (34.25%). In conclusion, the present study highlights the role of Aspirin and EDTA as antibiofilm agents when used with Nystatin which have the ability to inhibit the growth of *C. albicans* in patients with vulvovaginitis.

Keywords: *Nystatin, Aspirin, EDTA, C. albicans, Biofilm, Vulvovaginitis.*

Introduction

Vulvovaginal candidiasis (VVC) is considered as the main infection caused by *Candida albicans*. Numerous virulence determinants and escalating resistance to antifungal therapy have contributed to its pathogenicity(1). Some virulence factors such as dimorphism and the ability to adhere and form biofilm on medical device and/or the host mucosal epithelium, enhance the pathogenicity of *C. albicans*(2). Vulvovaginal candidiasis defined as a disorder characterized by signs and symptoms of vaginal inflammation when the *Candida* species are found and is an ever living problem affecting 70–75% of women of reproductive age at least once during their life(3). The evolution of drug resistance of *Candida* species to conventional antifungal agents has been a major medical challenge worldwide; attempt to use the potential antifungal agents with appropriate therapy efficacy and minimum effects is considerably growing(4). The mechanism underlying development of antifungal resistance of *C. albicans* are complex and involve multiple pathways and genes. Further,

Corresponding Author:
Kais Kassim Ghaima
Assistant Professor, Institute of Genetic Engineering and Biotechnology for Postgraduate Studies, University of Baghdad, Baghdad, Iraq
e-mail: kaiskassim@gmail.com

these mechanisms continue to change and evolve and challenging the medical clinic [5]. The widespread use of antibiotics, frequent use of indwelling medical devices, and a trend towards increased patient immunosuppression has resulted in a creation of opportunity for clinically important *Candida* to form biofilms and there is growing evidence of the importance of *Candida* biofilms in clinical problems [6]. Therefore the aim of this study is investigate the biofilm formation of *C. albicans* isolates as the causative agent of vulvovaginitis in Iraqi women, also using of some compounds such as Aspirin and EDTA as antifungal agents against the high antifungal resistant isolates.

Materials and Method

***Candida albicans* isolates:** In this study, a total of 42 *C. albicans* clinical strains were collected from women patients with vulvovaginitis from three hospitals in Baghdad, Iraq, during the period from September to December 2019. All strains were previously identified by API Candida system (bioMérieux, France) and confirmed using VITEK 2 compact system (bioMérieux, France).

Quantitative biofilm production assay: The Colonies from all isolates of fresh *C. albicans* cultures (48 hours) were grown at 37°C in Sabouraud dextrose broth medium for 24 hours. Biofilm formation was tested by adding 100 µl of this standardized cell suspension to wells of microtiter plates that contained 100 µl of fresh Sabouraud dextrose broth media and incubating them at 37°C for 48 hours. Thereafter, the medium was removed and planktonic cells were removed by washing the biofilms in phosphate buffered saline. After staining plates with 2% crystal violet for 20 m, excess stain was removed using water. The plates were air dried and then the dye was resolubilized with absolute ethanol. The optical density (OD) of each well was measured at 570 nm using Enzyme-Linked Immunosorbent Assay (ELISA) reader (BioTek, Korea). Optical density cut-off value (ODc) was calculated using the equation: average OD of negative control + (3*SD of negative control) [7].

Minimum inhibitory concentration of Nystatin, Aspirin and EDTA: Nearly, 100 µl (0.5 McFarland) of the *C. albicans* culture was inoculated into each well of a 96-well microtiter plate containing 100 µl Nystatin, Aspirin and EDTA at different concentrations (0.39–200 µg/ml). Wells without Nystatin, Aspirin and EDTA were used as a positive control while those without *Candida* were considered as negative controls. After 24 hours incubation at 37°C, the wells were visually inspected for the growth. The MIC was considered as the lowest concentration of Nystatin, Aspirin and EDTA that inhibits the Yeast growth[8].

Antibiofilm activity of Nystatin, Aspirin and EDTA: This test was performed on four strains that showed strong biofilm formation ability in the biofilm production assay. The effect of different concentrations of Nystatin (3.125-100 µg/ml), while Aspirin and EDTA (31.25-1000 µg/ml) to inhibit the ability of *C. albicans* cells to form a biofilm was assessed using the TCP method adopted by Khodavandi *et al*. (2011) [9]. Nearly, 100 µl of 0.5 McFarland yeast cultures was dispensed into each well of 96-well polystyrene microtiter plates in the presence of 100 µl of the antibiofilm agent at different concentrations, and plates were incubated at 37°C for 48 hours. Antimicrobial agent free wells served as positive controls for the biofilm growth. After incubation, the medium and non-adherent cells were removed and wells were washed three times with sterile PBS. The plates were air dried and then the dye was resolubilized with absolute ethanol. The OD of each well was measured at 570 nm using ELISA reader (BioTek, Korea). Each assay was performed in triplicates.

Statistical Analysis: The Statistical Analysis System- SAS (2012) [10] program was used to detect the effect of difference factors in study percentage. Chi-square test was used to significant compare between percentage (0.05 and 0.01 probability). Least significant difference LSD test (Analysis of Variation-ANOVA) was used to significant compare between means in this study.

Results and Discussion

Biofilm formation: Out of 42 *Candida albicans* isolates, 37 (88%) can produce biofilm at the varying degrees. Twenty-eight (75.7%) isolates could form a strong biofilm, while 6 isolates were the moderate producer, and only 3 isolates were weak biofilm formers. Also it was found that five isolates don't have the ability to formation the biofilm (table 1). Microtiter plate assay using crystal violet was used for detection the ability of *Candida albicans* to form biofilm (figure 1).

Table 1. Distribution of biofilm formation ability among *Candida albicans* isolates.

Candida albicans	Biofilm formation			
	Weak	Moderate	Strong	Negative
Total no of Isolate = 42	3	6	28	5
%	7.14%	14.29%	66.67%	11.90%
Chi-Square (χ^2)	12.073 **			

** (P≤0.01).

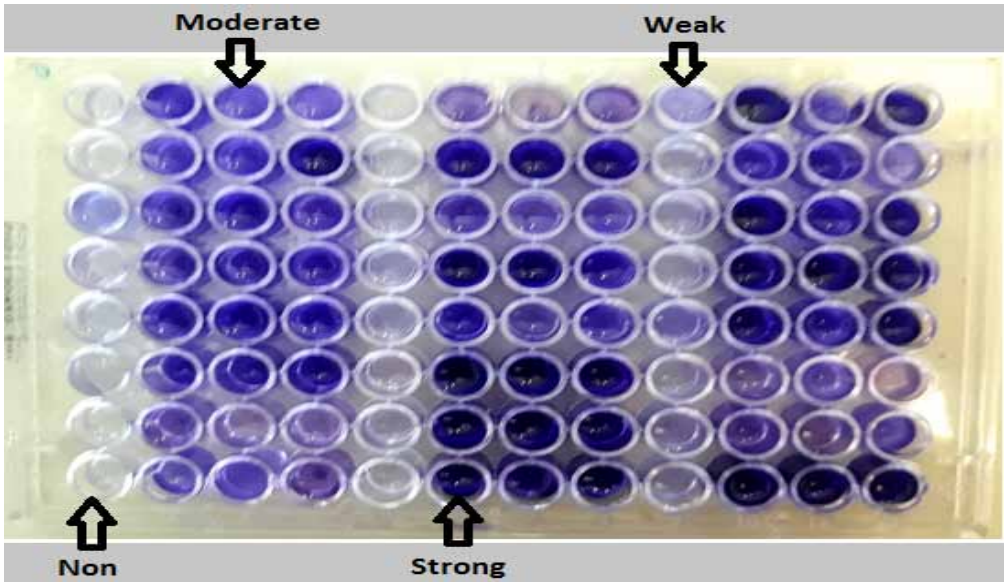

Figure 1. Biofilm formation detection of *Candida albicans* isolates by microtiter plate assay.

This study revealed that the most of *Candida albicans* isolated from Iraqi women patients with vulvovaginitis formed a strong biofilm. Many studies demonstrated the ability of *Candida albicans* clinical isolates to form heterogeneous biofilms. The presence of these communities in vulvovaginitis may explain why *C. albicans* infections remain unresponsive to therapy, and there was a relationship between biofilm formation and antifungal resistance among *Candida* isolates [11, 12]. The study of Shreif *et al.* (2019) [13] in Egypt which included one hundred *Candida albicans* isolates from patients with nosocomial infections revealed that the biofilm capacity was identified by the microplate method in 58% of *C. albicans* and the optical density was intense in 20 isolates, moderate in 21 isolates and mild in 17 isolates. The local study of Mohammed *et al.* (2017) [14] demonstrated that *C. albicans* was the most predominant species among vaginal specimens in percentage (45%) and all *C. albicans* isolates were biofilm producers with variable strength, Among vaginal isolates; 10/22 (45.5%) were weak biofilm formers whereas moderate or strong biofilm formers were 12/22 (54.5%). In a previous study, it was found the *Candida* biofilms have important clinical implications since the biofilm associated with *Candida* or *Gardnerella* genital infections may act as a chlamydial reservoir contributing to the transmission of *Chlamydia trachomatis* in the population, alongside its dissemination in the female upper genital tract [15]. The biofilm formation is very important virulence factor in *C. albicans*, where this species expresses hyphal-specific adhesins and regulators required for adhesion. Also, the morphological dimorphism in *Candida albicans* supports noticeable phagocyte escape mechanism [16].

The present study investigated the role of some compounds as antibiofilm agents against the biofilm formation in *C. albicans* isolates, these compounds are Nystatin, Aspirin and EDTA. At first, the minimum inhibitory concentrations (MICs) of these compounds were measured by microdilution method in 96 well microtiter plates with resazurin dye and then detection the antibiofilm concentration by exposing the yeast

to subinhibitory concentration in the same plate with crystal violet staining.

The results of minimum inhibitory concentrations (MICs) of Nystatin, Aspirin and EDTA against 28 *C. albicans* isolates which formed the strong biofilm, revealed that range of concentrations of Nystatin were (6.25-100 µg/ml), while the MICs of aspirin and EDTA were more than 1000 µg/ml. The table 2 and figure 2 demonstrated the MICs of 2 isolates by using the double concentrations (from 0.39 to 200 µg/ml) and it was obvious that there is no effect of Aspirin and EDTA on the growth of *C. albicans* at the used range while the Nystatin had the inhibitory activity at the concentrations 6.25 and 12.5 µg/ml against the isolates 1 and 2 respectively.

Table 2. The minimum Inhibitory Concentrations (MICs) of antibiofilm agents against *Candida albicans* isolates.

Antibiofilm agent	Candida albicans	Minimum Inhibitory Concentration (MIC) (µg/ml)									
		0.39	0.78	1.56	3.12	6.25	12.5	25	50	100	200
Nystatin	Isolate 1						+				
	Isolate 2					+					
Asprin	Isolate 1	-	-	-	-	-	-	-	-	-	-
	Isolate 2	-	-	-	-	-	-	-	-	-	-
EDTA	Isolate 1	-	-	-	-	-	-	-	-	-	-
	Isolate 2	-	-	-	-	-	-	-	-	-	-

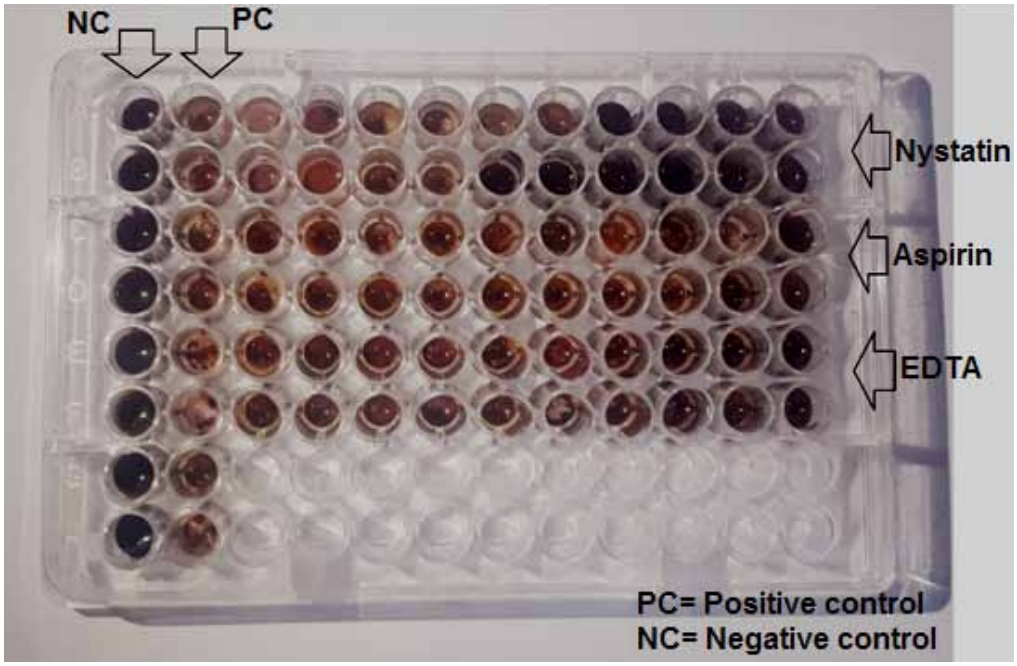

Figure 2. The minimum Inhibitory Concentrations (MICs) of antibiofilm agents against *Candida albicans* isolates by microtiter plate assay with resazurin dye.

The previous study included 14 yeast strains 7 control strains were investigated regarding their *in vitro* susceptibility to the polyene antifungal agent nystatin, the Minimum inhibitory concentrations (MICs) for nystatin were measured by both visual examination, and spectrophotometric measuring after 24 and 48 hours incubation time at 36°C. The visual read-out of growth inhibition revealed MICs for nystatin in a range from 0.625 to 1.25 µg/ml for all *Candida* species tested, where the *Candida albicans* strains, and both

strains of *C. glabrata* and *C. tropicalis,* showed low MIC values 0.625 µg/ml [17]. Many previous studies found that nystatin MICs for *C. albicans* isolated from vulvovaginitis ranged from 1 to 16 µg/ml, with a MIC inhibiting 90% of isolates (MIC_{90}) of 4 to 16 µg/ml [18,19].

The current study consistent with Al-Bakri *et al*. (2009) [20] study which indicated to need of high concentrations of Aspirin and EDTA to achieve MIC against *C. albicans*, where Aspirin MIC values (mg/ml) of 2.03, 1.2 and 2.65 were achieved against *P. aeruginosa, E. coli* and *C. albicans*, respectively. An EDTA concentration as high as 60 mg/ml failed to attain the MBC value, while aspirin MBC values (mg/ml) of 4.8, 4.9 and 5.28 were reported against *P. aeruginosa, E. coli* and *C. albicans*, respectively. Also, the results of Cederlund and Mardh (1993) [21] demonstrated that Aspirin possesses a relatively weak broad-spectrum antimicrobial activity where relatively high concentrations of aspirin are needed to effect biostatic activities and even higher concentrations are needed for biocidal activities. Antipyretics such as Aspirin primarily act by inhibiting prostaglandin synthesis. Fungi produce prostaglandins, and although their exact function is uncertain, it is thought that they influence virulence, in particular controlling the yeast-to-hypha transition and biofilm production. Also, changing the surface hydrophobicity of microbes and modifying the susceptibility of microbes to antimicrobial therapy[22;23].

It is also known that anticoagulant and calcium and magnesium chelator EDTA (Ethylenediaminetetraacetic Acid) may have antimicrobial activity against several Gram-positive bacteria and *Candida* spp. EDTA forms chelation with divalent metals such as Mg(2+) and Ca(2+), which are required by various essential enzymes[24,25]. EDTA demonstrated the highest antifungal activity in comparison with routine antifungal drugs by prevent the binding of *C albicans* to the proteins in a dose-dependent manner and reduces the growth of *C albicans* by removing calcium from the cell walls and causing collapses in the cell wall, and by inhibiting enzyme reaction[26]. EDTA acts on the cell surface, resulting in the rapid release of approximately half of the lipopolysaccharide with a negligible loss of other cell components. The disruption of the lipopolysaccharide structure in the outer membrane of Gram-negative bacteria occurs because EDTA chelates divalent cations. The release of lipopolysaccharides increases the membrane permeability to other agents, hence the potentiating action[27].

The effect of some antifungal and antibiofilm agents (Nystatin, Aspirin and EDTA) on the biofilm formation of *C. albicans* isolates were achieved using microtiter plate assay with crystal violet staining (figure 3).

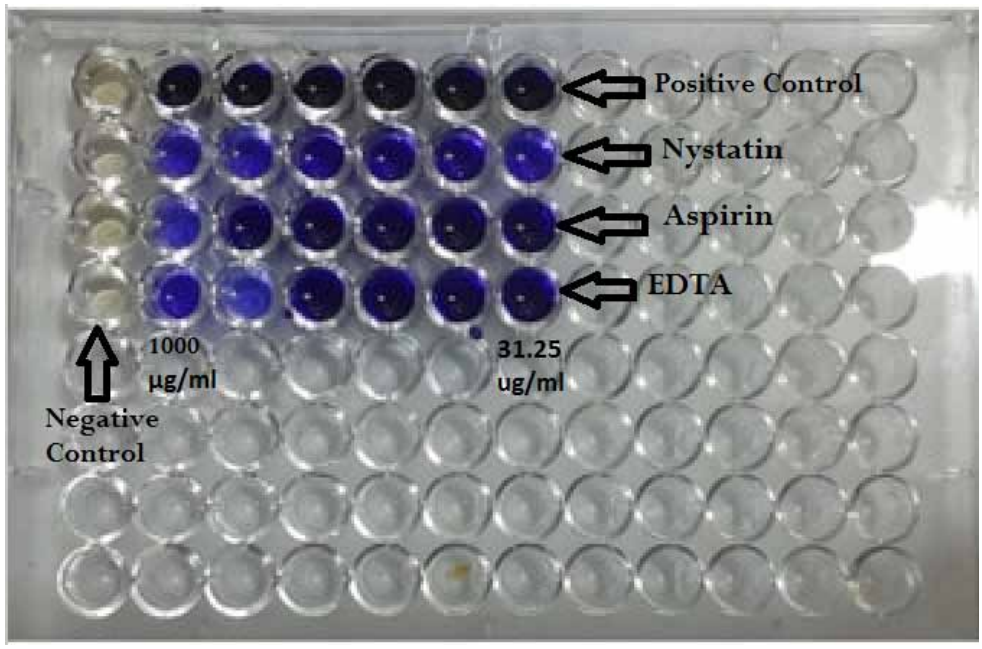

Figure 3. Biofilm quantification by microtiter plate assay of *Candida albicans* (isolate 5) at different subinhibitory concentrations of Nystatin, Aspirin and EDTA.

The results of effect Nystatin, Aspirin, and EDTA at subinhibitory concentrations against the biofilm formation of 28 *C. albicans* isolates which formed the strong biofilm, revealed that the Inhibition activity of biofilm formation by nystatin was stronger relative to Aspirin and EDTA, and this antifungal agent had antibiofilm effect even though at very low concentrations (table 3).

EDTA (Ethylenediaminetetraacetic Acid): The highest antibiofilm activity by Nystatin were demonstrated at the subinhibitory concentration 50 µg/ml with biofilm eradication percent (75.80%), while the lowest antifungal effect (2.86-10.70%) was at very low concentrations (3.125-6.25 µg/ml). Also, there was an obvious biofilm eradication of Aspirin and EDTA at the concentrations 500 and 1000 µg/ml but the effect of aspirin at the concentration 1000 µg/ml (70.51%) is more than EDTA (60.12%) in contrast with the concentration 500 µg/ml, it was found that the effect of EDTA (51.29%) is more than aspirin (34.25%). The effect of other concentrations (31.25-250 µg/ml) on the biofilm formation was not significant in comparison with the higher concentrations. The results revealed that nystatin at low concentration showed a significant effect as antifungal and antibiofilm agent in comparison with the high concentrations of aspirin and EDTA.

Concerning inhibition of biofilm production in the presence of subinhibitory concentrations of the Nystatin, the present study reflected more promising significant effects for treatment with this antifungal agent (75.80% reduction) which are more than studies reported by other investigators, as in El-Houssaini *et al*. (2019) [28] (30.86% reduction), and the study of Redding *et al*. (2009)[29] (70%

reduction). Many studies showed that the treatment of clinical *C. albicans* isolates with subinhibitory nystatin, concentrations significantly decreased production of extracellular hydrolases, Also, the greatest inhibitory effect on phospholipase and aspartyl protease production and a noticeable significant impact on inhibiting biofilm formation of *C. albicans* clinical isolates [28]. De Prijck and coworkers investigated the effect of nystatin released from modified polydimethyl siloxane disk as a model for incorporating antifungals in medical devices against biofilm formation by *Candida* spp. Nystatin exhibited a concentration-dependent inhibitory effect on *Candida* biofilm formation in a microtiter plate [30].

It was demonstrated that EDTA alone (at 25 and 2.5 mM) significantly reduced fungal metabolic activity in preformed biofilms. Also, EDTA combined with fluconazole significantly reduced the growth of biofilm when compared to biofilm treated with fluconazole alone [31]. EDTA resulted in partial reduction of catheter colonization by *C. albicans*, As previously reported, the combination of EDTA with low minocycline concentration (0.1 mg/ml) resulted in a significant decrease in catheter colonization but combined with higher concentrations of minocycline resulted in complete eradication of *C. albicans* biofilms [32].

According to the results of effect of aspirin on the biofilm formation in *C. albicans*, it was found that cyclooxygenase-dependent synthesis of fungal prostaglandins is important for both biofilm development and morphogenesis in *C. albicans* and may act as a regulator in these physiological processes and that aspirin possesses potent antibiofilm activity in vitro and could be useful in combined therapy with conventional antifungal agents in the management of some biofilm-associated *Candida* infections [33]. Studies have shown that cyclooxygenase (COX) inhibitors, such as aspirin, ibuprofen, and indomethacin, combined with fluconazole can significantly reduce *Candida* adhesion and biofilm development and increase fluconazole susceptibility; the MIC of fluconazole can be decrease from 64 to 2 µg/ml when used in combination with ibuprofen. In addition, *in vivo* studies have also confirmed the antifungal activities of these inhibitors [34]. Aspirin alone or in combination with conventional antifungal drugs is also beneficial for the treatment of vulvovaginal candidiasis by inhibition of cyclooxygenases in host cells and by inhibition of 3-hydroxyoxylipins in *C. albicans* [35].

Conclusion

The present findings indicated to the role of some drugs or compounds such as Aspirin and EDTA when used with effective antifungal agents in control the infections of *Candida albicans* especially in the women with vulvovaginitis by inhibition the biofilm formation which considered as the main virulence factor in Candida species.

Radiographic Evaluation of Five Variables in Iraqi Young Subjects among Impacted and Erupted Lower Wisdom Teeth Groups

Nuhad A. Hassan[1], Amal R.S. Mohammed[2]

[1]M.Sc., Assistant Professor at Department of Oral Medicine, College of Dentistry, AL- Mustansiriyah University, Iraq, [2]M.Sc., Professor at Department of Oral Medicine, College of Dentistry, AL- Mustansiriyah University, Iraq

Abstract

Objective: To look at those contrasts in five variables in connection to sex between impacted and erupted lower wisdom teeth groups on digital panoramic radiographs in Iraqi young subjects.

Those variables that compared were: retromolar space might have been measured by drawing a line starting with Ricketts (Xi) by drawing accordance with the focal point of the ramus on the distal surface of the lower 2nd molar. Retromolar space starting from the anterior edge of claiming ramus (AER-7) might have been measured dependent upon those distal surfaces of the more level the 2nd molar along the occlusal plane. The angle of the tooth axis of the 2nd and 3rd molar (β angle). Mesiodistal width of the lower wisdom tooth (MDW) was calculated, while space/width ratio (SWR) might have been gotten through (AER-7/MDW).

Materials and Method: This study comprised 80 patients their ages varying between 20 and 25 years all of them having full dentition with bilaterally present mandibular 3rd molars. After they examine clinically, lower 3rd molars were distributed into two; Group A erupted (20 male and 20 female), whereas Group B included the impacted mandibular 3rd molars (20 male and 20 female). Five variables were measured in all radiographs to make a comparison between the two groups. The data analysis was done by using SPSS (ver.10) by applying T-test and descriptive tests.

Results: The means of (Xi-7, AER-7, MDW) are larger in males than females in both groups A and B. The means of (Xi-7, AER-7,) are larger in group A than group B. the mean of the β angle is larger in group B. the mean of SWR in group B is less than1.

Conclusion: This study demonstrated that the long axes of the 2nd molar and wisdom teeth (β angle) and a space parameter were important parameters in predicting mandibular 3rd molar eruption.

Keywords: *Panoramic; 3rd molar; impacted tooth, ramus, center.*

Introduction

The 3rd molar (M3) varies more than the opposite molars in terms of shape, size, the timing of eruption, and even tendency toward the impaction. In modern societies, M3s get impacted for more than any other teeth, and the impaction of mandibular M3 is more common than its maxillary counterpart[1]. Impaction can be defined as the failure of the whole eruption right into an everyday useful function of one tooth within ordinary time due to the absence of space within the dental arch, as a result of obstruction with some other tooth or development in an abnormal position[2]. Panoramic radiography is a radiological technique thatcan produce a single tomographic X-ray image of curved facial structures, including the maxillary and mandibular

dental arches together with their supporting structures. Based on panoramic radiograms, it is possible to evaluate developing wisdom teeth and their surrounding tissues [3]. As stated by a few studies, there is no sex predilection in the impaction of M3[4,5]. However, Hugoson and Kugelberg[6] indicated a higher frequency in females than males.

The point of this investigation to look at those contrasts in five variables in connection to sex between erupted and impacted lower wisdom teeth groups on digital panoramic radiographs in Iraqi young subjects.

Materials and Method

In this study, the samples collected retrospectively from the patients attending the college of dentistry-Mustansiriyah University from the time between (September 2017 - April 2018), about 80 patients all of them having full dentition with bilaterally present mandibular wisdom teeth their ages are among 20 and 25 years (40 were females and 40 were males). Patients were divided into two groups of mandibular wisdom teeth, first group was A, the patients in group A were having mandibular wisdom teeth which were fully erupted into functional position in the other side there was the 2nd group B, the patients in group B comprised the mandibular wisdom teeth which were below the occlusal plane/erupted up to the occlusal plane but they were not fully functional due to their aberrant angulations. Digital panoramic radiographs (My ray CE 0051(V.B1 cocc A 14/C-IMOLA (BO)-Italy, X-ray source (75kVp, 5 mA), exposure time (9.34 sec), (52 mGycm), the analyzing process for all patients was by using different measurements. The measuring of the retromolar area done with the aid of sketching a straight line starts from Ricketts (Xi) point i.e. centers of ramus and it reaches until the distal surface of the lower second molar. The retromolar area from the anterior edge of the ramus (AER-7) was measured up to the distal surface of the lower 2nd molar alongside the occlusal plane. The angle of the tooth axis of 2nd molar and wisdom tooth (β angle). The mesiodistal width of the lower wisdom tooth (MDW) was calculated; Figure (1), whereas the gap/width ratio (SWR) was obtained through (AER-7/ MDW). The means of all five variables between left and right have been taken. Data, which was then, analyzed the usage of SPSS for detecting the distinction between the two groups' means.

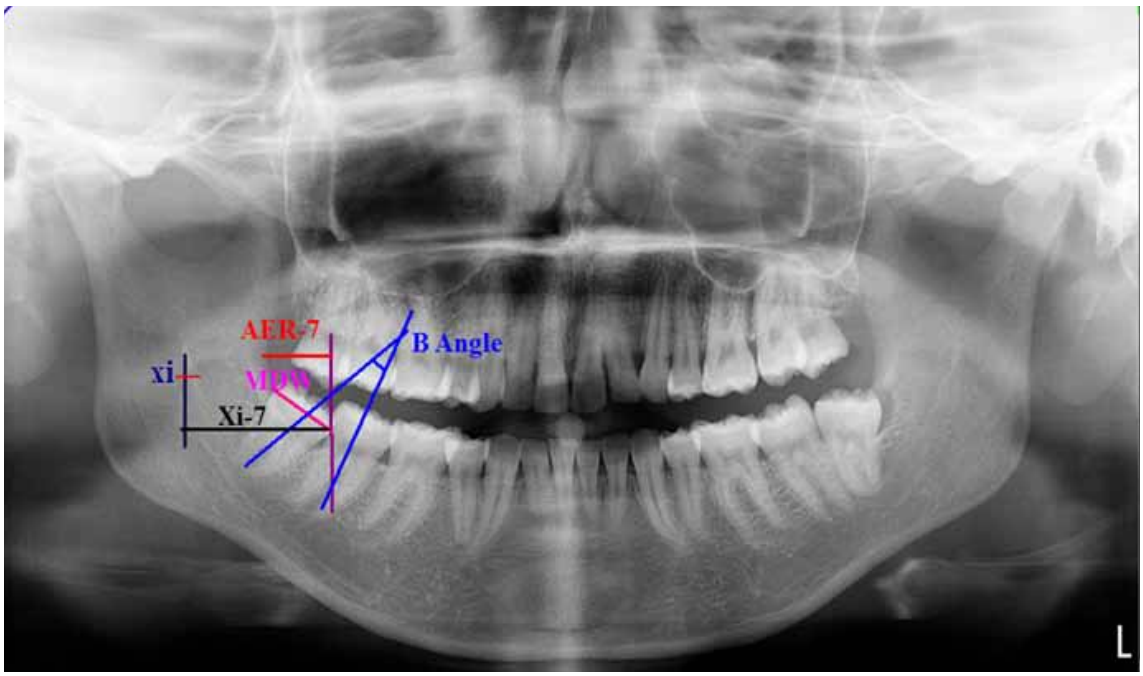

Figure (1): The measuring of the retromolar area was accomplished through sketching a straight line starts from Ricketts Xi point i.e. center of ramus and it attains till the distal surface of the lower 2nd molar. The retromolar area from the anterior fringe of the ramus (AER-7) became measured as much as the distal surface of the lower 2nd molar along the occlusal plane. The angle of the tooth axis of the 2nd and 3rd molar (β angle). Mesiodistal width of the lower 3rd molar (MDW).

Results

The means of (Xi-7, AER-7, MDW, β angle) would bigger for males than females in group A and the means of (Xi-7, AER-7, MDW) would bigger for males than females of group B, as shown in table (1).

Table (1): Descriptive of groups by gender.

	Gender	Statistic	Xi-7	AER-7	MDW	β Angle	SWR
Group A	Female	Mean	28.415	16.7965	12.095	16.775	1.41115
		SD	4.163185	1.477314	1.888955	3.097006	0.183264
	Male	Mean	29.984	17.7045	13.343	16.925	1.35045
		SD	3.988505	1.645637	2.288056	3.138366	0.170794
Group B	Female	Mean	26.865	10.975	12.903	36.95	0.8477
		SD	5.723477	3.70048	2.275161	3.594221	0.220419
	Male	Mean	27.91	12.855	13.5135	36.475	0.94525
		SD	6.006304	3.169837	2.278772	3.94193	0.124564

In group A, the means of (Xi-7, AER-7) are larger than group B, the mean of SWR in group B is less than 1 while the mean of β angle is larger in group B, table (2), figure (2) illustrated that.

Table (2): Descriptive of group A, and Group B.

Groups	Statistic	Xi-7	AER-7	MDW	β Angle	SWR
Group A	Mean	29.1995	17.2505	12.719	16.85	1.3815
	SD	4.101854	1.610587	2.165219	3.078461	0.177685
Group B	Mean	27.3875	11.915	13.20825	36.7125	0.8965
	SD	5.81502	3.531655	2.268746	3.731171	0.183451

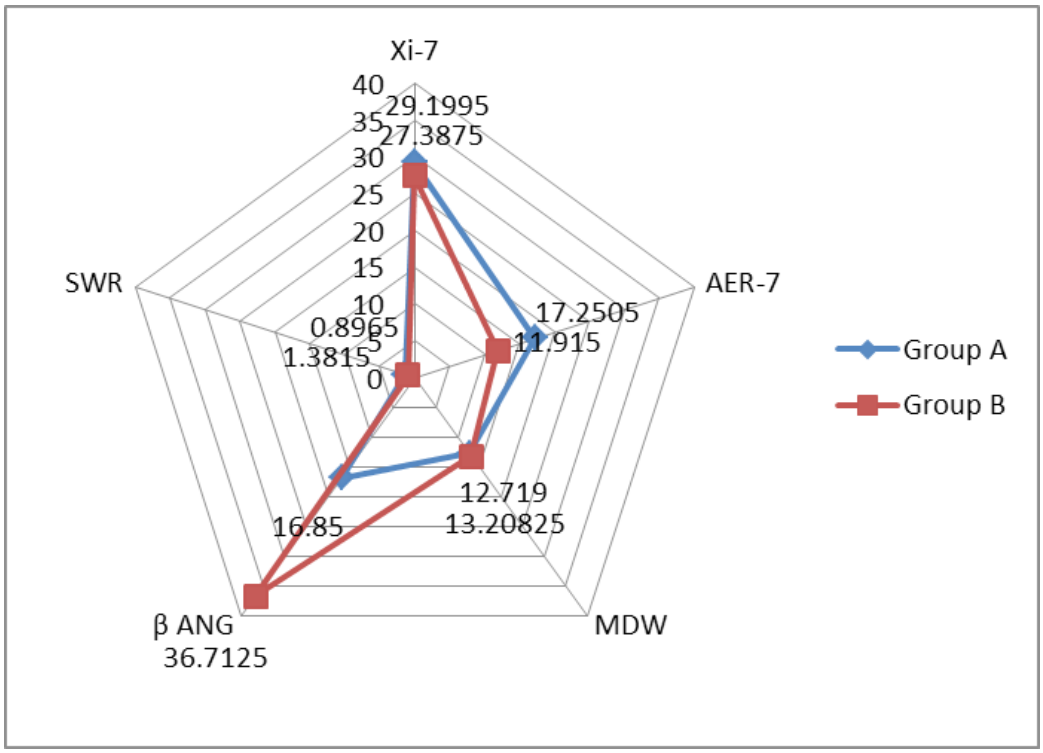

Figure (2): Show means of variables in A & B groups

The T-test between males and females for (AER-7, MDW) indicated a statistically significant difference in group A while it indicated a statistically significant difference for (AER-7, MDW, SWR) in group B, table (3) explained that.

Table (3): T-test between Males and Females of each group.

Groups	Statistic	Xi-7	AER-7	MDW	β Angle	SWR
Group A	t-test	1.471	2.355	2.381	0.286	1.100
	P-value	0.158	0.029	0.028	0.778	0.285
Group B	t-test	1.090	3.889	2.517	0.414	2.515
	P-value	0.290***	0.001**	0.021*	0.683***	0.021*

The T-test between group A and group B showed a highly statistically significant difference for (AER-7, SWR, β angle), table (4) clarified that.

Table (4): T-test between group A and group B.

Statistic	Xi-7	AER-7	MDW	β Angle	SWR
T-test	2.201	12.260	1.472	22.433	10.178

*P<0.05 Significant, **P<0.01 High significant, ***P>0.05 Non-significant

Discussion

Due to there is no space in human jaws, this thing has been a subject of great interest for a long period. The mandibular retromolar space is one of the most studied factors for two main reasons: the lower wisdom teeth are the 2nd most-affected teeth [7,8,9]and the absence of space may be viewed as the main reason for this. Thus, the tests of this space must be performed very carefully, particularly on young patients[10]. It'd make expected that facial growth, jaw size, and tooth length differ amongst races and populations seeing that there were only a few studies articles around this problem primarily based on the Serbian population[11], this observes comparative in terms of gender for the Iraqi full dentition population, it showed that β perspective and an area parameter had been valuable parameters in predicting mandibular 3rd molar eruption which is in a near settlement with the part of findings of a examine performed with the aid of Uthman(2007)[12] using panoramic radiographs for Iraqi subjects.

Within the present day observe, the mean value for xi-7 became larger for Group A than for the organization on Group B which turned into near findings through others[13,14] and it concluded that the average value for xi-7 turned into larger in adult males than ladies with a full eruption that's in the settlement with some other previous examine [15].In this study, the suggested distance from AER to the distal surface of the 2nd molar becomes larger for A than Group B. tremendous difference turned into found among the two clusters. Ventä[16] stated that the probability of eruption is 100% if the retromolar area is as a minimum of 16.5 mm and Quiros and Palma[17] additionally located the range between 14-17 mm in the erupted group that is an agreement with the result of this look at. The prevailing examination conforms with the finding of Hattab and Alhaija[18] who mentioned that ladies had smaller than males. The prevailing have a look at and different research[14,18] additionally affirmed that 3rd molars had been larger in the impacted group. It'd had been viewed as that the growth of the lower retromolar area ought not to be anticipated after the age of 16 [19,20]. On the other hand, Chen et al. [21] observed that there is a sizeable growth of this area between the age of sixteen and eighteen. this problem may be clinically considerable, considering that possibility to predict impaction of lower 3rd molar in an early stage could favor the decision to get rid of it easily earlier than the roots are completely shaped .within this survey at the SWR become bigger within the erupted group with the average value of 1.3815 wherein as within the impacted group, it changed into 0.8965.

That is following preceding studies[12] which found this ratio to be much less than 1 within the marginal eruption group and greater than 1in the total eruption group. Olive and Basford[22] concluded that the gap/ width ratio gives a dependable appraisal of the available retromolar space for the 3rd molar eruption and that orthopantomogram presents for the best estimation of the desired ratio, whilst the lateral cephalogram is unsure. Kahl et al. [23] located that the general public (97.40%) of impacted teeth did no longer have enough space and after 7 years of the statement, Gansset al. [24] concluded that, if the gap/3rd molar width ratio is greater than 1, most of the wisdom teeth could ultimately enter the arch which confirmed with the locating of this research.

An Iranian study executed via Ezoddini Ardakaniet, et al. in 2014[25] to determine and evaluate the eruption space of unerupted and erupted 3rd molars via the approach of digital panoramic radiography (seventy-three men and seventy-seven ladies with the common age of 21.18 ± 1.67 years), a statistically giant difference was located among the 2 groups in regard with the common perspective among 2nd and 3rd molar, the implied space of retro-molar and its ratio to the width of 3rd molar in addition to the suggest distance among centers of ramus and 2nd molar (P=0.0001), they concluded that increasing the angle among 2nd and 3rd molar, as well as an inadequate area of retro-molar, can cause impaction of lower 3rd molar that is in a close settlement with the effects of this Iraqi examine.

In the current study, the β perspective is larger in group b and women than group A and males, so it has been validated that the larger the inclination, the larger the probability of impaction which is in similarity with the result of the previous study[26]. It has been recommended in other to examine that if a 3rd molar has a low preliminary inclination and good enough area, then eruption is viable[3].

Conclusion

This study demonstrated that the long axes of the 2nd and 3rd molars (β angle) and a space parameter were important parameters in predicting mandibular 3rd molar eruption.

Ethical Statement: This study was conducted in accordance with the World Medical Association. Declaration of Helsinki, the approval of the scientific committee of the Oral Medicine Department was gotten.

Declaration of Competing Interest: The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

Funding: No funding was received for this study.

Information Seeking Problems that May Occur Against Covid-19 Vacccine When it is Ready

Olowo Emmanuel Opeyemi[1], Hamisah Hasan[2], Abdul Mua'ti[3], Julia Wirza Mohd Zawawi[4]

[1]Doctoral Degree Student, [2]Associate. Professor, [3]Professor, [4]Senior Lecturer, Department of Communication, Faculty of Modern Languages and Communication, 43400 Univ. Putra Malaysia, Serdang, Selangor

Abstract

Information-seeking patterns of vaccine receivers have over time been determined their vaccine decisions. These patterns are mostly represented by their demographic representation. Therefore it is interesting to review how these demographic representations have affected vaccine choices in the past. This paper would serve as a guide to health officials, human communication experts and pharmaceutical companies in the development and distribution of Coronavirus vaccines when it is ready.

Keywords: *Information seeking, Corona virus, Religion, Income, Side-effects, and Vaccine Hesitancy.*

Introduction

The 8th of December, 2019 foresaw the first reported case of Corona Virus Disease 2019 (COVID-19) in Wuhan, China[1]. By April 25th 2020 over 2.8 million cases and 200,000 deaths have been confirmed all over the world with the United states of America, Italy, China and Spain were countries with most reported cases[2]. More so as at the time of this study vaccine against or to prevent this pandemic is not available. However, the World Health Organization (WHO) were able to team up with global forces, the mainstream media, and the government to pass out "the kick out coronavirus" campaigns[3]. This message published in 18 languages were protrude as (i) hands, washing of hands generally with soap or alcohol-based solutions (ii) elbow, covering of mouth and nose with a bent elbow or tissue whilst sneezing or coughing (iii) Face, avoid touching your face especially the "T-Zone" to prevent virus from entering your body (iv) distance, social distancing is way to break the chain of the virus. Keep a safe space always (v) Feel, it you feel unwell, please report to the local health authorities around you[4]. These measures could only serve as more of a preventive measure against the virus than a permanent cure or anti vaccine solutions that have been put in place to tackle past epidemic and pandemic crisis. COVID-19 does not just alter and stretch medical personals and systems it has broken the world's economy as stocks and oil prices are falling by the data[4].

This chaos has led to an emergency call/need for vaccines against, and to cure COVID-19. Vaccine development is ridiculously expensive. normally it takes between 20-30 months for a vaccine to complete clinical trials and Food and Drug administration FDA approvals. the race is on for the first pharmaceutical com to develop an approved (COVID-19) vaccine, but at what cost? would it be affordable? These are questions this paper will try to collate together. For example, [5] reported that over four thousand works have begun a trial for a century-old vaccine for tuberculosis to see it if it could serve as an immune build up against the virus but not a cure. The assumption of this vaccine is that if your immune are stronger, it would limit the fatality of the virus if you were infected. Subsequently, the Murdoch Children's Research Institute (MCRI) explained that the vaccine results were expected in about six months' time. Another by [5] illustrated that COVID-19 is expected to be on the market in at least 18 months. Although leading pharmaceuticals like 'Inovio' explained that a DNA-based vaccine has begun pre-clinical trials (human

test ready). More so GlaxoSmithKline are developing a protein vaccine "molecular Clamp" that enables COVID-19 to enter human cells. The United States company "Moderna" has already begun testing an RNA-based treatment [6]. On April the 20thDr.Jennifer Miller, Ph.D stated in an interview to abc NEWS that one of the challenges involved in the clinical trials for a COVID-19 vaccine is procurement of a vaccine that is responsive to population needs/demands as the vaccine would be needed all over the world when it is ready [5]. However, it is important to understand how people approach health related issues based on their information seeking behaviours.

Wilson defines 'information behaviour' or 'information seeking behaviour' as a need that arises in order to fill a knowledge quest or to satisfy an information need [7].Case, [8] explained that, an information need may consist or perceive a difference between an actual state of knowledge or an ideal state of knowledge. This information need might be satisfied by searching or seeking information from an informal or formal services or source of information, which might result in failure or success in finding that information. If this search for information is successful, the person might then make use of such information acquired to satisfy the need for it or transfer such a knowledge to another[10]. The race to develop a vaccine is much impressive, and the with the aid of technology one could be ready in 6-8 months. The questions remains that are manufactures putting into consideration everyone in the world and trying to learn from previous mistake?

would the manufacturers of this vaccine put into the consideration religious sentiments and beliefs during production? as we know people reject vaccines simply because it contains (religious) forbidden ingredients. For example, [9]could be referred to as one of the pandemic era in medical history because of the outbreak of measles and pertussis. This event in similar fashion like the COVID-19 caused for social distancing and exclusion from work and school in the affected areas[11].Although as at the arrival of the vaccine, there were certain relgious complications which influenced vaccine decisions [17]. A study by [19] found that some groups in india refused their childern vaccinations due to relgious predictive factors. For the catholicis the most common issues regarding vaccinaions has been the moral reflection on vaccines derived from using cells of a voluntatry aborted fetus[18]. However, the catholic doctorines didn't directly cover this vaccination topic directly, it only expalins on the ability of human intellect and emphasises to always "save lives." The protestant on the other hand are of the view that vaccination is an act of lack of faith in God. This explains why side effects following vaccinations are seen as a punishment from God [17]The Jewish have a contradicting view to that of the Orthodox, they believe that people should vaccinate based on the recommendations of the health care professionals[16]. The Islamic tradition forbids use of certain food "haram" add this irritations are transfer to vaccinations as well, as seen In the case of Islam vs vaccines which contained pig DNA[7]These religions sentiments can/would be a major problem for vaccine developers should there be a break through with the vaccine against COVID-19. They would have to find a balance where all of the population are comfortable with the ideology of vaccination[12].

Yes, the race to bit time and this pandemic means vaccines ought to be ready like yesterday, but would the emergency bypass for this vaccines not lead to another catastrophe in side effects? According to the study by the World Health Organization (WHO) in 2013 they explained that the public has a really tolerance to vaccine adverse reactions. Therefore, vaccines can only be administered when there are very rare or minor reactions reported[13].Logically a vaccine that has passed all medical/clinical trials have been deem good enough by the appropriate authorities as good enough for the public. These vaccinations could be in oral or injection forms. Subsequently, such adverse effects like dizziness, fever, headache, pain, swelling, and loss of appetite [14]. With the race to create an emergency vaccine to help combat COVID-19 which should be out there in the market as soon as possible, pharmaceuticals need to be vary of the possible side effects that could follow such vaccine, because a severe reaction or complication might lead to an out-right of the vaccine [13].

More so, we have people who believe non-medical exemption for vaccines. they were never vaccinated. if a vaccine is available, would they be forced to accept the vaccine even if it is against their right knowing full well that they could endanger the whole nation?

In the United States of America (USA) for example, there are states that allow nonmedical exemptions (NMEs). These emptions are allow children to be exempted from vaccines due to medically contradictory reasons[15]More so, parents are allowed to be exempted based on their personal, philosophical and religious beliefs as NMEs are considered as a balance in child

welfare and protection of parental rights and public health[20]. In the State of Texas the main reason for NEMs has been philosophical exemptions. Although states like Oregon, Washington and California have made the process of [2].

Lastly, would the vaccine be acceptable to 1/3 of the world's population due to the cost of the vaccine? [6]explained that, income can be categorized into two; i) High income countries, ii) low income countries. [6], continued that high-income countries (HIC) are often of the opinion that vaccine is a victim of its own success. Parents in this category believe or argue that the decrease of Vaccine preventable diseases (VPD) means they don't need the vaccine anymore, as thus, the fear of receiving "useless vaccine" is more prominent that the fear of VPD. Low income countries on the other hand, still believe in the ideology of vaccination. So, it's really unclear as to why there is a decrease in acceptance amongst them [6].[8] in an article reported for the Los Angeles Times, explained that vaccine exemptions in more than 150 schools in Los Angeles rose above 8%. Parents responsible for these emptions were those who earn an average of $94,500. Hiltzik concluded that schools and government shouldn't allow these "rich" parents affect the herd immunity with their poor vaccine decisions[8].[21] illustrated in their study that, Low income adults are more open to accepting vaccinations when compared to the high-income adults. also pointed out that, due to personal experience, with VPD most women view vaccination positively [22].

Conclusion

As the world currently seek possible solutions to the COVID-19 pandemic, it is empirical for pharmaceutical to reflect on the possible determinates of vaccine hesitancy. A vaccine is only as useful as the acceptance rate. More so, given that the nature of this kind of vaccine that would be useful to everyone irrespective of their socio demographic representation. This is tricky because of the contagion rate of the pandemic. One cannot afford to leave out a certain heterogenous anti vaccine population. Questions of how the United Nations (UN) would enforce those against non-medical exemptions to take the vaccine when it is eventually ready is fascinating. Would the rights of private individuals be treated and put into consideration before the safety of the herd? How would they be convinced to accept the vaccine? As for religion, as observed above that might be a little flexible if the "forbidden' materials are not used in the procurement of the vaccine. However, the protestants who believe that vaccinations is against the almighty protection of God might also posit another complication. Lastly, due to the pandemic a lot of companies have been forced to lay off their employees. How affordable would the vaccine be that a family would not be forced to choose between their daily meal and vaccination? Affordability is a key essential in vaccine acceptance.

Abstract

The pandemic of COVID-19 has globally interrupted the education systems. Many countries including Jordan forcefully moved to online education. This study is designed to build an innovative Framework to overcome the concerns and challenges of online clinical teaching.

A cyclical module of the Online Clinical Training Pathway (OCTP) was created to provide an opportunity for students to document their learning, in the form of a reflection guide. Each module aims to attain the intended learning outcomes through a set of four integrated learning activities. OCTP success was assessed by regular evaluation parallel with semi-structured interview targeted faculty members and students across courses and student levels. The results emerged a new framework of the teaching and learning of synchronous distance learning among participants. Technical limitations were also observed with regards to internet-connection speed and reliability. Quality indicators of the synchronous and asynchronous online environment were issues that need to be addressed. Creating opportunities to enhance online engagement through the use of new framework methodology provides a promising direction to bring experiential education into the online context.

Our institution, a private university, offers a BScs nursing program, and as a consequence of the government orders directed toward the control of the spread of new COVID-19 infection in Jordan. University moved to a dual system of synchronous (Microsoft Team) and asynchronous distance learning (V class/Moodle) in March 2020. There are particular considerations for clinical courses in nursing. Nursing faculty members were under pressure and they need to be innovative to overcome concerns and challenges while teaching clinical courses since online education replaced the traditional face-to-face on-campus classes. Other concerns were challenging, as the emphasis on student interactions, continuity of quality of education, achieving the learning outcomes, and aiming to attain highly caliper competencies following Benner's model[(1)].

Nursing faculty adopted Benner's model (2001) that describes five levels of proficiency in nursing to obtain the specialized competencies for each clinical course.

Thus, this study aimed to build an innovative Framework to overcome the concerns and challenges of online clinical teaching.

Challenges and Resolution: Learned Lessons:

Ensure the Lecturer Sees Participants' Faces along with the Lecture Slides: It is always helpful for lecturers to see students' faces to recognize students' reactions. Microsoft Teams can display up to 40 participants on a screen and allows users to use dual screens [2,3]. Unfortunately, the number of students you can display depends on your (Personal Computer) PC's specification. The instructor PC's CPU should be Intel i7 or equivalent to be able to show 49 participants on display [4]. If the computer has Intel Quad-Core i3, so it could only display 15 on a window, and when there are a larger number of participants, the instructor needs to scroll the window to watch all students, which is not convenient [4,5]. So, instructors need to use two sets of PC and external monitors to see all participants. Additionally, the quality of the internet used by the Instructor may limit the uses of options within the Microsoft Team.

The Quality Standards of Case Sceneries: The online-training methodology is a method that tries to rebuild real-world characteristics and to enhance learners' clinical judgment, by using a problem-solving approach integrated into interactive learning scenarios[3,4]. These scenarios provide students with practical experience and immediate feedback through debriefing and guided reflection[7].

Faculty of Nursing adopted a set of quality standards when the case sceneries designed as follows: (a) identify patient and other problems apparent or expected in the case, (b) suggest alternative problems that might be possible if more information were available, (c) identify the information needed, (d) identify relevant and irrelevant information in the case, (e) interpret the information to enable a response, (f) propose different approaches that might be used, weigh approaches against the evidence, select the best approaches for the case situation, and provide a rationale for those approaches, (g) Identify gaps in the literature and evidence as related to the case, and (h) evaluate the effectiveness of interventions, and plan alternative interventions based on analysis of the case.

Student-Instructor Interactions: Due to such imminent challenge with online courses, interaction is one of the major factors that were also extensively investigated in several studies [7,8,9]. Determinants of student interaction in online learning were a lot. Learners' style, instructor teaching style, course content, course design and length, instructional style, class size, and support system are examples of such determinants[7,8,9].

The online teaching environment creates some obstacles for student-instructor interactions during the sessions. Several actions need to be considered by the Instructor. Instructors normally need to ask students to mute their microphones during the session, as microphones can catch a background noise, which makes the instructor's voices less audible. Even if the Instructor displays all students' faces, it is still challenging for a lecturer to visually notice signs that students want to say something. Instructors need to more systematically (rather than naturally) organize interactions.

To enhance students' readiness and interaction in a weekly manner proceeding of the online session, the standardized videos, competency checklists, and structured case scenarios were uploaded on a synchronize (MOODLE/V class) system.

Further, on daily basis, the Clinical Training Portfolio was used by the instructor. Portfolios are valuable for clinical evaluation because students provide evidence in their portfolios to confirm their clinical competencies and document new learning and skills acquired in a course. The focus will be on inter-professional communication, collaboration professionalism, and teamwork by applying meaningful, and realistic scenarios[9] followed by a guided reflection that is a helpful tool in health care, to develop professional practice and improve the quality of care[3,10].

Evaluation for Students' Interaction: In follow-up for debriefings of student-instructor interactions, the training provided to learners with feedback about their professional manner, attitude, and interpersonal skills, thus promoting standardized, rather than personal learning; this feedback is immediate and from the critical point of the adopted course portfolio.

The evaluation was conducted in three steps. The first step aimed to assess the current status of each competency for students based on the course portfolio. An evaluation was conducted every week. Various method focusing on the critical and/or core points were

used such as the folded and unfolded case scenario, self-exam module, short quizzes, and students' presentation. The second step aimed to explore the opportunities for improvement; the faculty members were conducted a weekly basis meeting to do a gap analysis to each course. The analysis was done by discussing the achievement report provided in the form of reflection which includes the target and desired level of competencies based on Benner's adopted model.

In the third step, the evaluation aimed to follow up on the implementation of the action plan using an objective structured clinical examination (OSCE) and a final written exam. OSCE and the final written exam cover all educational materials uploaded in the MOODLE and matched with the Nursing Student Clinical Training Portfolio and parallel with learning outcomes for each clinical course.

Method

The study was guided by Benner's model. Online Clinical Training Pathway (OCTP) was created to provide an opportunity for students to document, in the form of a reflection guide. Using a semi-structured interview, purposive sampling of faculty members (focus group) (n = 4) and students (n = 6) from different courses and levels were recruited to evaluate barriers and facilitators of OCTP utilization.

The interviewer (moderator) guided the discussion according to a written set of questions or topics to be covered, as in a semi-structured interview. Focus group sessions are carefully planned discussions that take advantage of group dynamics for efficiently accessing rich information in an efficient manner. Typically, the people selected for a group (usually through purposive or snowball sampling) are a fairly homogeneous group, to promote a comfortable group dynamic. The setting for the focus group sessions selected carefully and, ideally, should be a neutral one.

Analysis: Use quantitative method as adjuncts to qualitative analysis was used similar to Kidd et al., ([11]. Filling gaps of OCTP evaluation and return demonstration end by implementing a New framework for clinical course distance training.

Ethical Considerations: Written IRB approval was obtained as an expedited review from the Scientific Research Committee of Nursing Faculty at Al-Ahliyya Amman University (AAU).

Results

Newly Emerged Online Framework: The huge challenges in online teaching for clinical courses were to tell students exactly what they should achieve and to continuously monitor their progression. The student is required to learn predetermined sets of intended learning outcomes for each course supervised by Faculty members.

He/she worked intensively and closely with the administrative support system to make this framework evident and ready for implementation. First, there is an agreement to run the clinical training in three phases: Phase- 1 preliminary phase (pre-training phase) refers to the activities and preparatory work made before the actual conduct of training. In this phase, actual preparations are made for launching the program. It involves the following activities: assessment of the needs of training design, and development of the training courses according to intended learning outcomes.

Phase -2 will follow the framework that was created and named as Online Clinical Training Pathway (OCTP) (Figure 1). Figure 1 describes the four consequent steps during the OCTP. Before the launching of OCTP and going live a crash session was conducted to all faculty members to explain the OCTP steps, integrate OCTP effectively within in a dual system of synchronized and a synchronized online training, and to obtain feedback of online training via a structured weekly performance report submitted by the instructors to the coordinator of clinical training.

In phase-2 of OCTP, students will be assigned to direct assignments depending on their level of learning and the nature of the course (e.g. standardized video, case scenarios, short essay, questions, log paper, self-exam module, and critical point care, etc.). All assignments were submitted through a synchronized online learning platform (V-class/Moodle). Following the assignments submission, all graded assignments will be discussed in an interactive online session conducted via synchronized distance learning (Microsoft Team). The online session via Microsoft Team provides students a chance to interact with their instructors and other students and help faculty members to explore the clinical reasoning and judgment of their students.

Additionally, students need to go a long standardized video, and competency-based check-off based on the National Council Licensure Examination (NCLEX)

standards. Students are required to be mastered certain psychomotor skills in a real clinical setting. So, a structured of folded and unfolded case scenarios were built and match with clinical intended learning outcomes for each course and compatible with the Nursing Student Clinical Training Portfolio to achieve this goal. These blended method provided to students in touch with the clinical area will enhance their critical thinking, reasoning, and clinical judgment once since they are way from the clinical area due to the constraints of lockdown and quarantine associated with the pandemic state of COVID-19.

In phase 2 evaluation is evident and continuously monitored, it is a process to determine the relevance, effectiveness, and impact of activities in light of their objectives. In this phase, four criteria were included: reaction, learning, behavior, and results. OCTP program is continuously assessed and the gap noticed in this training will be followed by remedial actions after the commencement of education on campus. Phase 3 and phase 4 were proposed based on the continuous evaluation method during phase 2. In phase 3 and phase 4, a 2 weeks intensive training in a simulation lab followed by a final written exam and objective structured clinical examination (OSCE) are an example of future proposed remedies. The integration of all online training phases starting from preliminary to OCTP use and evaluation process was ended by the emerging Khraisat and Al-Bashaireh Distance Training Model (KADTM) as showed in Figure 1.

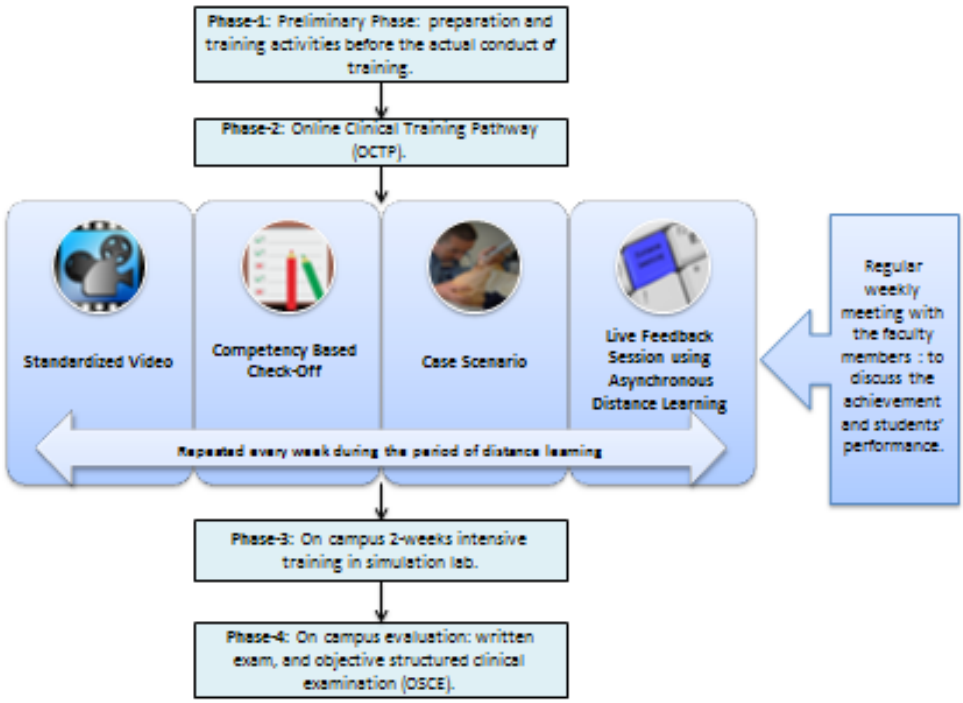

Figure 1: New Framework for Clinical Courses: Distance Learning Followed by Proposed On-Campus Training and Evaluation (Khraisat and Al-Bashaireh Distance Training Model (KADTM).

Discussion

Evaluation of Implementation of New Framework: As part of the evaluation of the implementation of the new framework, a semi-structured interview was used among a focus group of faculty members to assess barriers and facilitators of effective utilization of Synchronous Distance Learning (Microsoft Team) and Asynchronous Distance Learning (V-class/Moodle).

Data were collected on Tuesday (17/3/2020) between 08:00 and 11:00 pm, after 3 days of using Microsoft Team. Also, another (6) students from different courses and levels were involved by using a semi-structured interview to evaluate their responses to the implementation of online education during the pandemic crisis.

The faculty members reported that online teaching is a new experience; they learned a new strategy of

teaching synchronous distance learning. It may be used in the future as a supportive tool for the classical session. They reported that student culture needs time to be improved regarding the use and application of ethical standards when they are online. Additionally, they reported that evaluation was difficult for clinical courses since a large number of students.

Further, students reported that they were able to catch the required information from instructors in theory courses. However, they think the challenge wherewith the clinical courses. All students think they able to achieve 70-100% of learning outcomes for the course of theory; however, they think they may able to achieve 30-40% of learning outcomes in clinical courses. Similarly, 5 of 6 students said it was a great experience," I learned a new strategy of the teaching of synchronous distance learning". The majority of the students (4 out of 6) reported they were gotten a huge material even more than before (classroom) and they spend more time reading and preparation. They were highly committed to attend the online class was reported by 5 out of 6 students.

Technical problems reported in (e.g. accessing, hearing Instructors' voices, internet disconnection, shared folder appearance, Instructor control for the session) with Microsoft Team and Moodle (50%). The mainstream of the students expresses a fear concerning the evaluation process. 4 out of 6 students ask for more flexibility from their Instructors concerning the deadlines, quizzes, attendance, and feedback.

Hence, the first few days up to the first week most of the issues were related technologies such as access, use, connectivity, voice, noise, and control while using Moodle or Microsoft Team. However, in the second week, these complaints vanished, students become more focused on the material, reading, Instructor feedbacks, and the anxiety toward the midterm exam.

Conclusions

Both faculty members and students reported they " learned a new strategy of the teaching and learning of synchronous distance learning". Distance Learning is an educational occasion that helps students to understand the content better and improves their engagement in learning.

Creating opportunities to enhance online engagement through the use of simulation provides a promising direction to bring experiential education into the online context; in light of the COVID-19 outbreak and preparation for potential future outbreaks, the provision of such opportunities becomes critical in higher education contexts. Although it was not identified through this experience, when shifting to distance training encounters it is useful to consider the challenges and limitations that may be faced by the learners, instructors, and involving aspects related to professional competence, professionalism, and non-verbal communication skills. Future studies to use the KADTM as a methodology can examine: (a) the impact of distance training on the learners' affective domain-including contextual challenges and psychological, social, and cultural barriers.

Limitations: Distance-training programs identified some limitations to be considered, regarding the use of body language and non-verbal skills. Technical limitations were also observed with regards to internet-connection speed and reliability. Quality indicators of synchronous and asynchronous online environment efficiency were issues that need to be addressed**.** Teaching effectiveness and performance quality indicators were two categories were also emerged. Computer anxiety was reported by some students**.** Furthermore, the accessibility to a stable internet connection can be a limiting factor.

Conflict of Interest: None to declare.

Financial Disclosure: There is no financial disclosure.

Factors Contributing to Emotional Distress among Postpartum Mothers with Newborns at Newborn Unit Kenyatta National Hospital, Kenya

Omulo O. Wycliffe[1], Cheptum Jebet Joyce[2], Mageto G. Irene Mageto[3]

[1]BSc Nursing Student at the Stime of the Study, [2]Lecturer, Midwifery and Obsteric Nursing, [3]Lecturer, Mental health and Psychiatric Nursing, School of Nursing Sciences, University of Nairobi, P.O Box 19676-00202, Kenyatta National Hospital Nairobi, Kenya

Abstract

Background: The expectation of a woman during pregnancy is to have a healthy live bay with no complications. Admission of a newborn baby to the newborn unit is distressing to the parents, more so in cases where there is little or no support from the health care team and other players.

Objective: To establish factors contributing to emotional distress among postpartum mothers with newborns at newborn unit Kenyatta National Hospital, Kenya.

Method: This was a descriptive cross-sectional study employing a quantitative method by use of an interviewer-administered questionnaire. The study was conducted among 59 postpartum mothers with newborns at the Newborn Unit Kenyatta National Hospital. Simple random sampling technique was employed and data collected using a pretested semi-structured questionnaire. Data was analyzed using Statistical Package for The Social SPSS version 25 software. Qualitative data was coded, categorized into themes and thematic analysis done.

Results: The factors contributing to maternal emotional distress were low levels of education primary 14(23.7%) and secondary 23(39.0%) and unemployment 27(45.8%). In addition, lengthy NBU stays 34(57.6%), ineffective communication patterns 18(30.5%) and null communication 9(15.3%) between mothers and the healthcare givers contributed to emotional distress.

Conclusion: There are sociodemographic, socioeconomic, and hospital factors contributing to maternal emotional distress.

Keywords: *Emotional distress, postpartum mothers, newborn unit, factors, baby.*

Introduction

Postpartum period is the duration immediately after birth of a child and the expulsion of placenta extending to about 6 weeks[1]. During this period, the maternal body undergoes a lot of physiological changes to return into the non-pregnant state. Mothers face a lot of challenges during the postpartum period[2]. These include need for social support, issues with breast feeding (especially first-time mothers) and need for help with postpartum emotional distress among others. Globally, emotional distress during the postpartum period will impact negatively on both the maternal and the newborn health and well-being[3]. Emotional distress is the second most common cause of maternal deaths in United States of America (USA) with about 20% of the affected population committing suicide each year[4]. Maternal

emotional distress negatively impacted on the mother-child bonding leading to impaired neurodevelopment among the children in China[5]. It was reported that emotionally distressed postpartum mothers have higher chances of early breastfeeding termination. 40% of children in such cases were ending up underweight and stunted in growth. Apart from increasing mortality rate with emotional distress, mothers also showed less affectionate manners towards their newborns in USA[6]. In Kenya, the prevalence of infanticides among emotionally distressed mothers as at 19% and 1 out of 10 emotionally distressed mothers is likely to commit suicide.[7,8]

Newborn unit (NBU) admissions have been associated with elevated emotional distress among the postpartum mothers [6]. It is believed that the NBU environment, the prolonged duration of hospital stays due to newborn admission among other factors contribute to heightened emotional distress among the mothers.

Sociodemographic and socioeconomic factors have been found to contribute to emotional distress among postpartum mothers [9]. These include being household heads, low level of education and financial constraints [10]. Hispanic women living in the rural areas of Southern California were more likely to develop emotional distress during the postpartum period due to low level of education, unemployment, caesarean mode of delivery and being a primipara [11]. Mothers who experienced suicidal thoughts during pregnancy, those who were exposed to domestic violence, those who had unplanned pregnancies and a history of a previous psychiatric illness were at a higher risk of developing emotional distress [12].

A few studies have been conducted to establish the factors which may lead to the heightened emotional distress among the NBU mothers. These are different from the causes of newborn admissions themselves. World Health Organization reports poverty, low social support, exposure to violence and extreme stress among other factors as the causes of emotional distress among such mothers [13]. Several hospital factors have been found to contribute to emotional distress among postpartum mothers with babies at the NBU with regards to the complexity of such environments[14]. Concerns that the health care team may misunderstand the newborn's needs and mothers feeling of lack of information on the diagnosis or treatment of their newborns contributed to maternal distress [15]. In a systemic review of parental needs for mothers with NICU newborns in US, there was lack of communication of information, maternal involvement in the newborn's care and lack of positive perception by and interaction with the NICU staff [16]. In a descriptive study in Turkey (state hospital Canakkale city), information communication, empathic emotional support and mothers' involvement in the treatment and diagnosis of their newborns lacked among the health care team[17].

Lack of communication from health care staff was yet still a stressor in the NBU among the mothers of Midwestern [6]. Mothers felt alienated from care of their newborns. Poor bedside manner of the medical staff was also of major concern. Half of the mothers were being informed of the newborn's disease in inappropriate situations and most of them complained of negative attitude among health care professionals [18]. The unfavorable hospital conditions, not being able to see their newborns whenever they wished and not being able to get enough information regarding their newborns were also of major concerns.

With regard to Kenya's Sustainable Development Goal (SDG) 3 of ensuring healthy lives and promoting well-being for all at all ages, maternal and hence neonatal health and well-being is vital and relying on the country's efforts in the delivery of health care services to her citizens. Kenyatta National Hospital (KNH) therefore being the largest referral health facility receiving both direct admissions and referred cases from all across the country, it was very important to identify those postpartum mothers at potential risk for emotional distress and appropriate interventions implemented. In ensuring the same, the findings from this study may help establish those factors contributing to emotional distress and help put up the strategies to reduce such incidences.

Materials and Method

This was a descriptive cross-sectional study employing a quantitative method to establish factors contributing to emotional distress among postpartum mothers with babies at the newborn unit at Kenyatta National Hospital. A sample size of 59 mothers who met the inclusion criteria were randomly selected to participate in the study. Data was collected using an interviewer administered questionnaire. Data was cleaned, coded and entered in SPSS version 25 and analyzed. Descriptive statistics was reported and data was presented by use of figures and tables. Ethical approval

was sought from Kenyatta National Hospital–University of Nairobi (KHN-UON) Ethics and Research Committee and permission at the Kenyatta hospital granted by the head of department obstetrics and gynecology.

Results

On sociodemographic factors, majority of the respondents 17(28.8%) were aged between 18-23 years old. The mothers who were married were 32(54.2%). According to the findings, secondary 23(39.0%) and primary 14(23.7%) respectively were the levels of education attained by most mothers. The mothers residing far and very far from the hospital were 34(57.6%) and 17(28.8%) respectively. Those who had fairly good experience (uneventful) during pregnancy were 34(57.6%) while those with challenging and extremely stressful experiences were 17(28.8%) and 8(13.6%) respectively. The primiparous mothers were 23(39%) while 36(61%) were multiparous. Those who delivered through caesarian section and spontaneous vertex delivery were 25(42.4%) and 34(57.6%) respectively.

On socioeconomic factors,majority 27(45.8%) of the mothers were unemployed. Most mothers 34(57.6%) had income levels below 10,000 shillings. A larger percentage 39(66.1%) of the mothers reported to be the sole breadwinners in their families. On theother hand, mothers reported their past medical history and majority 37(45.1%) of the mothers had not previously suffered from any psychiatric illnesses.

On hospital factors, 34(57.6%) of the mothers had babies admitted to NBU for durations between 4-6 days while those above 6 days were at 25(42.4 %). According to the findings, majority of the mothers 33(55.9%) and 20(33.9%) found the explanations regarding the baby diagnoses as helpful and confusing respectively. Most mothers 31(52.5%) and 17(28.8%) were worried and confused respectively upon first incubator sight of the baby.For15(25.4%) of the mothers, theNBU policies were hindering while 20(33.9%) found them as stressful with only 24(40.7%) reporting the policies as protective. Majority of the mothers 28(47.5%) and 15(25.4%) received updates on baby's progress upon inquiry and weekly respectively. The findings showed 18(30.5%) and 9(15.3%) of the mothers reporting the mothers-caregivers' communications as ineffective and null respectively. Mothers who found the hospitals counseling services as insufficient were 29(49.2%), 22(37.3%) as beneficial while 8(13.6%) did not receive any form of counselling. All the findings are as shown in the table 1 below.

Table 1: Sociodemographic factors contributing to emotional distress among the respondents

Discussion

Sociodemographic Factors: The finding of this study showed that majority of the mothers had attained primary and secondary levels of educations. Even though majority of the mothers found explanations on baby diagnosis by the health care givers as helpful, a good percentage perceived them as confusing with resultant anxiety. This can be attributed to the low level of education among the mothers with the characteristics of the health care givers a side. Lack of basic education can inhibit the understanding of even simplified information because even then, language barrier is a problem. This finding is in agreement with the study done by Kim and Dee where low levels of education contributed to maternal emotional distress[19].

Socioeconomic Factors: The findings of this study showed that majority of the mothers were the sole breadwinners in their families (most of them were of small sizes). Most mothers were unemployed with a monthly income below 10,000 shillings. Due to the resultant financial strain in terms hospital costs and other incurred logistics, the additional stress is a contributory factor to maternal emotional distress. This can be attributed to non-engagement of the families in income generating activities and the unfavorable prevailing economic trends. This is in agreement with the previous study that being the head of the family was an additional stressor and a contributory factor to maternal emotional distress[9]. Other studies also found unemployment as a contributory factor to maternal emotional distress due to financial strains[19].

Hospital Factors: In this study, majority of the mothers had babies staying in the NBU for durations between 4-6 days and a few exceeding 6 days. Such long stays were attributed to negative perceptions among the mothers with increased worries putting them at risk for maternal emotional distress. This is in agreement with the study that lengthy NBU stays increased strain on the mothers and their relationship with their babies increasing their chances of emotional distress[20]. This can be attributed to care givers lack of care optimization perhaps due to inadequate medical and human resources leading to lengthy NBU stays.

The finding s of this study showed a good number of the mothers finding the care givers' explanations regarding baby diagnosis confusing even though majority found them helpful. This can be attributed to the care givers characteristics such as use of technical medical language exacerbating their stress. This is in agreement with the finding s of the study that mothers' lack of information on diagnosis of their babies contributed to maternal emotional distress[15]. In another study, one out of five mothers had no idea on the diagnosis of their babies hence becoming emotionally distressed[18].

The new born unit (NBU) is unfamiliar setting where mothers feel lost and frustrated with the negative perceptions contributing to emotional distress[20]. The findings of this this study showed majority of the mothers feeling worried and confused on the first sight of their babies in the incubators. Most mothers also found the NBU policies stressful and hindering as far as taking part in care of their babies is concerned. This is in agreement with the findings of the study that NBU policies had set up impediments to the mothers for developing interactional skills with their babies hence exacerbating their emotional distress[15]. In some other study, NBU was found to be a complex environment raising anxiety and stress of the mothers. This can be due to lack of the health care givers' commitment in bringing to mothers an envisage of what NBU is in prior. Attributions can also be made to alienating NBU policies and regulations.

Majority of mothers were receiving updates on treatment progress of their babies weekly and only upon inquiry. This could be attributed to the care givers' lack of involvement of the mothers in the care of their babies and with the accompanying negative perceptions contributing to maternal emotional distress. This finding is in agreement with the study that there was lack of information to the mothers on treatment progress of the newborns in NBU leading to increased maternal emotional distress[6,20].

In this study, majority of the mothers reported day to day communication between them and the healthcare givers as ineffective. This can be attributed to lack of involvement of the mothers by the healthcare givers in decision making and care of their babies and hence exacerbating their emotional distress. A tangible section of the mothers also reported the bed side manner of the healthcare providers as poor leading to stress among the mothers. These findings are in agreement with the study which found that poor bed side manner of the care givers, and lack of proper information communication gave the mothers a sense of alienation making them emotionally distressed[6]. In another study, lack of information communication, lack of maternal involvement and lack of positive interaction between the mother and the care giver was contributory to emotional distress.[4,20]

The findings of this study showed that the counselling services provided by the hospital were insufficient according to majority of the mothers. A few reported the nonexistence of such services. This can be attributed to such counselling services not meeting the individualized needs of the mothers hence not meeting the threshold to aid towards emotional distress. This in agreement with the findings of the study that lack of emotional support by the healthcare team to help the mothers in expressing their feelings in coping with the babies' critical conditions was contributory to emotional distress [3,17]

Conclusion

In conclusion, sociodemographic factors such as low levels of education and being the head of the family as a mother were contributing to maternal emotional distress. Socioeconomic factors such as unemployment and low levels of income were also contributing to maternal emotional distress with baby receiving care at the NBU. Hospital factors contributing to maternal emotional distress included: - lengthy NBU stays, inconsistent updates on baby's treatment progress and poor explanations by the health care givers, stressful and hindering NBU policies and regulations, ineffective communication patterns between the mother and the care givers and frail counselling services offered by the hospital.

Conflict of Interests: We declare no conflict of interest.

Assessment of Satisfaction Level and Quality of Life among Haemodialysis Patient's on Dialysis Therapy

Parimala L.[1], Mary Sofia[2]

[1]Vice-Principal, [2]B.Sc (Nursing) IV Year, Saveetha College of Nursing, SIMATS, Thandalam, Chennai 602105

Abstract

Background: Chronic diseases have become a major public health problem and the leading cause of morbidity and mortality. The burden of chronic kidney disease in India cannot be assessed accurately. QOL is an overall assessment of a person's well-being, which may include physical, emotional, and social dimensions, as well as stress level, sexual function, and self-perceived health status. Patients' quality of life (QOL) and satisfaction assessment are becoming increasingly important in health care delivery. There is evidence that better QOL and patient satisfaction might be associated with better medical outcome including reduced hospitalization and reduced mortality. The present aims are to assess the satisfaction level and quality of life among haemodialysis patients on dialysis therapy.

Method: A descriptive study was chosen to assess the satisfaction level and quality of life among 100 haemodialysispatients. The structured questionnaire was used to assess the satisfaction level and quality of life among haemodialysispatients. The present study results depicts that in regards to the level of satisfaction on dialysis procedure 16%were completely dissatisfied, 37% were dissatisfied, 18% were neither satisfied nor dissatisfied, 12% were satisfied and 17% were completely satisfied. The level of quality of life among haemodialysis patients, 8% had very negative impact, 42% had negative impact, 22% had no impact, 23% had positive impact and 5% had very positive impact.

Conclusion: The present study findings concluded that patients on HD were not having adequate QOL in all domains except patient satisfaction due to changes in the physiological, chemical changes occur in the kidney.

Keywords: *Satisfaction level, Quality of life, Hemodialysis, CKD and Dialysis Therapy.*

Introduction

Chronic kidney disease has become a major cause of global morbidity and mortality even in developed countries. Global status report on non-communicable disease (2010) stated that 80% of chronic disease deaths worldwide occur in low and middle income countries. CKD prevalence in all over the world predicated to reach 8-16% of the populations.[1] Chronic kidney disease is now the 3rd most common non-communicable disease in India. CKD incidence rises every year, especially in developing countries cause of increasing life expectation age, so that people have a longer age[2]. CKD therapy needs special treatment such as dialysis (Hemodialysis or peritoneal dialysis) or renal transplantation which needs a lot of costs. Renal transplantation actually is more efficient compared to dialysis because only in one treatment can make patients avoid dialysis procedure which takes place in relatively long duration. Meanwhile, many people use dialysis to treat CKD[3].

Chronic kidney disease is now the 3rd most common non-communicable disease in India. Worldwide statistics shows that 9, 20,000 people are undergoing haemodialysis per day, which constitutes about 7-8% of the population. Patients undergoing haemodialysis

in today's society will require several life style modifications like diet, fluid, work and activities of daily living. Dialysis is treatment for patients with temporary or permanent kidney failure. Haemodialysis is the most commonly used method of dialysis[4].

Kidneys are vital organs of our body and are integral to maintain the body's homeostasis. Dysfunction of kidney is very common now a day and may occur at any age with varying degrees. Kidney problems are acute and chronic kidney failure from stage 1 to stage 5 and end stage renal failure. Haemodialysis is the process, by which the crystalline substances will pass through a semi-permeable membrane, usually employed to remove waste and toxic products from the blood in cases of renal insufficiency. Haemodialysis was first developed by Thomas graham in 1884 and Dr William K off is considered as father of dialysis[5].

Watson stated dialysis is a therapeutic procedure used in acute and chronic failure to lower the blood level of metabolic waste products (urea, creatinine, uric acid) and toxic substances and to correct abnormal electrolyte and fluid balances. Two method currently in use are continuous ambulatory peritoneal dialysis and haemodialysis. Haemodialysis takes place outside of the body using a dialysis machine to which an artificial kidney is attached[6].

QOL is an overall assessment of a person's well-being, which may include physical, emotional, and social dimensions, as well as stress level, sexual function, and self-perceived health status[7]. Patients' quality of life (QOL) and satisfaction assessment are becoming increasingly important in health care delivery. There is evidence that better QOL and patient satisfaction might be associated with better medical outcome including reduced hospitalization and reduced mortality. Recently more attention has been paid to patient preferences in various renal replacement therapy modalities[8].

According to the findings of recent studies, 322 patients on maintenance HD in 3 Saudi dialysis centers participated in a study regarding factors affecting their satisfaction with their dialysis therapy. The results indicated that the level of satisfaction is influenced by gender, duration on dialysis, educational level, and standard of care given. Specifically, a lower level of education was associated with worse dialysis effect on stress, overall health, sexual life, hobbies, and exercise ability.[9,10]

In a study conducted by **Kim et al. (2013)** with regards to health related quality of life (HRQOL) and its association with self-efficacy and the treatment satisfaction in Korean dialysis patients; the study subjects were 237 patients receiving either HD or peritoneal dialysis (PD) from two university hospitals. The main finding showed that patients' self-efficacy and treatment satisfaction could influence their HRQOL.[11]

Palmer et al. (2014) conducted a survey to evaluate patients' experiences of specific aspects of HD care across several countries in Europe and South America. 2748 adults treated in HD participated in the study. Aspects of care that respondents the most frequently ranked as excellent were staff attention to dialysis vascular access; caring of nurses; staff responsiveness to pain or discomfort; caring, helpfulness and sensitivity of dialysis staff; and ease of reaching dialysis staff by telephone. The aspects of care least frequently ranked as excellent were information provided when choosing a dialysis modality, ease of seeing a social worker, information provided about dialysis, accuracy of information from nephrologists, and accuracy of nephrologists' instructions[12].

Although a considerable number of articles on QOL among haemodialysis patients have been published, few studies particularly are done to assess the level of satisfaction. Consequently, the assessment of the current issue needs to be better understood and addressed more among haemodialysis patients. The objectives of the study are to assess the satisfaction level and quality of life among haemodialysis patients on dialysis therapy.

Method and Materials

The research approach adopted for the present study was quantitative approach by using descriptive research design. The study was conducted in Saveetha Medical College and Hospital with 100 samples who satisfied the inclusion criteria were selected by using non probability purposive sampling technique. The Demographic data consisting of age, gender, education level, duration of dialysis, causes of renal failure. The satisfaction level was assessed using 5-point Likert scale among haemodialysis patients. The quality of life was assessed using 5-point Likert scale among haemodialysis patients. The project has been approved by the ethical committee of the institution. Informed consent was obtained from the participants before initiating the study. The data were collected and analyzed by using descriptive and inferential statistics.

Results

The current study reveals that out of 100 patients Majority of the participants belong to the age group of 41 to 50 years (48%), 64% were males, 61% had primary education. Regarding duration of dialysis, 19% had 21 to 50 sessions, 41% had 51 to 100 sessions and 40% of them had more than 100 sessions of dialysis. Regarding to cause of renal failure, 19% had arterial hypertension, 42%had diabetes mellitus, 29% had polycystic kidneys and 10% had other related problems.

Regarding to level of satisfaction on dialysis procedure, 16%were completely dissatisfied, 37% were dissatisfied, 18% were neither satisfied nor dissatisfied, 12% were satisfied and 17% were completely satisfied. (Table 1).

Table 1: Assessment of satisfaction level among haemodialysis patients

Level of Satisfaction	Frequency	Percentage (%)
Completely dissatisfied	16	16
Dissatisfied	37	37
Neither satisfied nor dissatisfied	18	18
Satisfied	12	12
Completely satisfied	17	17

Regarding to level of quality of life among haemodialysis patients, 8% had very negative impact, 42% had negative impact, 22% had no impact, 23% had positive impact and 5% had very positive impact. (Table 2).

Table 2: Assessment of quality of life among haemodialysis patients

Level of Satisfaction	Frequency	Percentage (%)
Very negative impact	8	8
Negative impact	42	42
No impact	22	22
Positive impact	23	23
Very positive impact	5	5

The current study also reveals that there is moderate positive correlation (r=0.682) between satisfaction level and quality of life among the haemodialysis patients. The duration of dialysis associated with better effect (P=0.030**) on satisfaction level among haemodialysis patients. The education level associated with better effect (P=0.021**) on quality of life among haemodialysis patients.

Discussion

The current study reveals that out of 100 patients Majority of the participants belong to the age group of 41 to 50 years (48%), 64% were males, 61% had primary education. Regarding duration of dialysis, 19% had 21 to 50 sessions, 41% had 51 to 100 sessions and 40% of them had more than 100 sessions of dialysis. Regarding to cause of renal failure, 19% had arterial hypertension, 42% had diabetes mellitus, 29% had polycystic kidneys and 10% had other related problems.

Regarding to level of satisfaction on dialysis procedure, 16% were completely dissatisfied, 37% were dissatisfied, 18% were neither satisfied nor dissatisfied, 12% were satisfied and 17% were completely satisfied.

The present study findings were supported by **M. Al Eissa** who reported that Patients were recruited from 3 Saudi dialysis centers. Using 1 to 10 Likert scale, the patients were asked to rate the overall satisfaction with, and the overall impact of, their dialysis therapy on their lives and to rate the effect of the dialysis therapy on 15 qualities of life domains. Results are 322 patients were recruited (72.6% of the total eligible patients). The mean age was 51.7 years (± 15.4); 58% have been on dialysis for > 3 years. The mean Charlson Co morbidity Index was 3.2 (± 2), and Kt/V was 1.3 (± 0.44). The mean satisfaction score was (7.41 ± 2.75) and the mean score of the impact of the dialysis on the patients' lives was $5.32 \pm 2.55_{8}$.[13]

Regarding to level of quality of life among haemodialysis patients, 8% had very negative impact, 42% had negative impact, 22% had no impact, 23% had positive impact and 5% had very positive impact.

Abraham et al. (2012) *who Assessed the quality of life in patients on haemodialysis and the impact of counselling* . The study revealed a remarkable difference in the QOL of HD patients in the test group during their first and second visits, while the control group showed only a slight or no change. There was an increase in the overall QOL of the test group patients when compared with the control group, although the baseline values are similar. The QOL of patients in the test group was compared with the control group using the independent t test. It showed that all the domain scores of the test group was significantly higher than the control group

(P <0.001). Thus, patient counselling seemed to play an important role in improving the QOL by changing their psychological thinking and initiating them toward spirituality.[14]

The current study also reveals that there is moderate positive correlation (r=0.682) between satisfaction level and quality of life among the haemodialysis patients. The duration of dialysis associated with better effect (P=0.030**) on satisfaction level among haemodialysis patients. The education level associated with better effect (P=0.021**) on quality of life among haemodialysis patients.

Conclusions

This study of patient satisfaction and quality of life with different aspects of long-term haemodialysis care suggests that patients' needs are not being fully met. The findings suggest that meeting patient expectations about information on dialysis choices and prognosis may be critical for improving patient experiences of long-term dialysis care and can form the basis for future healthcare services research in the dialysis setting.

Exogenous Cushing's Syndrome with Subsequent Secondary Adrenal Insufficiency in Patients with Long Term Steroid Usage

Cynthia Ayu Permatasari[1], Ferdy Royland Marpaung[2]

[1]Resident, Clinical Pathology Specialty Medicine Program, Faculty of Medicine, Airlangga University-RSUD Dr. Soetomo, Surabaya, Indonesia, [2]Lecturer, Clinical Pathology Department, Faculty of Medicine, Airlangga University-RSUD Dr. Soetomo, Surabaya, Indonesia

Abstract

Exogenous Cushing's syndrome is a collection of symptoms and clinical signs due to elevated levels of glucocorticoids (cortisol) in the blood because of prolonged consumption of glucocorticoid drugs. Glucocorticoids were introduced in the 1950s and have been used for anti-inflammatory treatment. Withdrawal of glucocorticoids can lead to complications of secondary adrenal insufficiency caused by suppression of the Hypothalamic-Pituitary-Adrenal (HPA) axis. Male, 28 years old, with weakness in both hands and feet throughout 3 days before admission to hospital. Other complaints include nausea (+), vomiting (+), diarrhea (-). He had been taking dexamethasone daily in the past 3 years until one month ago when he suddenly stopped. Physical examination revealed moon facies (+), striae (+) in the abdomen, and motor strength of 2 in all four extremities. Laboratory: K 2.0 mmol/L, Mg 0.8 mg/dL, GDA 64 mg/dL, Total cholesterol 240 mg/dL, cortisol 18.67 ng/mL, ACTH 2.1 pg/mL. The patient was diagnosed with exogenous Cushing's syndrome based on a history of long-term use of dexamethasone. Physical examination revealed moon face, buffalo hump, purplish striae, and hypertension. The patient stopped dexamethasone consumption suddenly and is consequently experiencing secondary adrenal insufficiency at the present time. As evidenced by laboratory values, there was a decrease in serum cortisol (18.67 ng/mL), as well as a decrease in serum ACTH (2.1 pg/mL). Based on the history of dexamethasone use, physical examination, and laboratory results, this patient had exogenous Cushing's syndrome. Sudden discontinuation of dexamethasone results in withdrawal symptoms in the form of secondary adrenal insufficiency as indicated by low cortisol and ACTH values.

Keywords: *Cushing's syndrome, glucocorticoid, withdrawal, adrenal insufficiency.*

Introduction

Cushing's syndrome is a term used to describe conditions resulting from increased concentrations of glucocorticoids (cortisol) in the blood circulation. The incidence of Cushing's syndrome is 0.7–2.4:1,000,000 population per year. This condition can be caused by factors outside (exogenous) or inside the body (endogenous)[1]. Corticosteroid use is the most common cause of Cushing's syndrome, the exogenous type of which depends on the dose and potency of the steroid used and the duration of usage[1–3].

Glucocorticoids were introduced in the 1950s, and have been used for anti-inflammatory, autoimmune and neoplastic treatment. Cushing's syndrome can manifest as a result of Glucocorticoids usage for treatment over a long period of time. Withdrawal of corticosteroids without tapering off can cause withdrawal symptoms, namely secondary adrenal insufficiency due to suppression of the hypothalamic-pituitary-adrenal (HPA) axis[3,4].

e-mail: ferdyoke@gmail.com

Adrenal insufficiency is a pathological condition characterized by decreased glucocorticoid production. Adrenal insufficiency is rare, with an incidence rate of <0.01% in the general population. It can be classified as primary and secondary, with the latter occurring when exogenous steroids suppress the hypothalamic-pituitary-adrenal (HPA) axis, resulting in insufficient stimulation of the adrenal glands to secrete adrenocorticotropic hormone (ACTH)[5,6].

Case Report: A man aged 28 years came with complaints of weakness in both hands and feet for 3 days prior to hospital admission. Other complaints include fever (+), nausea (+), vomiting (+), and decreased appetite. Bowel movement and bladder within normal limits. The patient was diagnosed with gout (3 years ago) and had since been routinely taking dexamethasone. In a day, the patient could take 9 to 15 tablets of dexamethasone until one month ago when the patient suddenly stopped.

Physical Examination 26 August 2020 (Upon arrival at the ER): The patient was generally weak; conscious (Compos mentis) with GCS 4-5-6; had blood pressure of 132/80 mmHg, pulse of 96×/minute, breathing of 22×/minute, and axillary temperature of 36.5 ℃. Other physical examinations revealed moon face (+), buffalo hump (+), and purplish (+) striae on the abdomen. The acral extremities felt warm, and there was atrophy of the lower limb muscles, as well as oedema of both legs. Neurological examination revealed paraparesis with motor muscle strength of 2 for all extremities.

Discussion

The adrenal glands, made up of the cortex and medulla, are located atop the kidneys. The adrenal gland cortex has 3 successive layers from the outside, namely the zona glomerulosa, the zona fasciculata and the reticular zone. These three layers secrete steroid hormones, namely mineralocorticoids produced by the zona glomerulosa, and glucocorticoids and androgens secreted by the zona fasciculata and the zona reticularis. Cortisol is the main product of glucocorticoids, which plays a role in regulating the metabolism of carbohydrates, proteins, and fats[7,8].

Cortisol secretion is controlled by corticotropin or adrenocorticotropic hormone (ACTH), which is secreted by the anterior pituitary, further regulated by hypothalamic hormones to secrete corticotropin (CRH). Both ACTH and CRH are controlled by cortisol via a feedback mechanism[2,7].

Glucocorticoids work as catabolic hormones, causing the breakdown of protein and fat and inhibiting protein synthesis in muscle, connective tissue, fat tissue, and lymphoid cells. This hormone also has an anabolic effect on metabolism in the liver[2,7,8].

This patient presented with complaints of weakness and fatigue. On examination, purplish striae in the armpits and lower abdomen was found. The breakdown of protein causes muscles to weaken, bone structure to thin, and lessens the skin's resistance. Stretch of the skin over the site of new fat deposition added with loss of elasticity due to protein catabolism results in rupture of blood vessels' surface. Blood seeps through the gaps caused by collagen catabolism so that purple striae can be observed[7].

The patient has hyperlipidemia characterized by increased levels of total cholesterol 240g/dL, triglycerides 160 g/dL, high-density-lipoprotein (HDL)-

cholesterol: 44 mg/dL, and low-density-lipoprotein (LDL)-cholesterol: 164 mg/dL. Hyperlipidemia occurs due to cortisol's potentiating effect on other hormones such as somatotropins and catecholamines in the lipolysis process in fat tissue[3,6,8].

Hypercortisolism causes accumulation of fatty tissue in particular places such as the face (moon face), the interscapular area (buffalo hump) and the mesenteric base (body obesity). The cause of this characteristic distribution of fatty tissue is unknown, but it is thought to be related to insulin resistance and/or elevated insulin levels[3,7]. As the case showed, this patient had moon face, buffalo hump and body obesity.

Additionally, he has hypertension, which, in patients with Cushing's syndrome, occurs due to increased production of angiotensin II as a result of increased hepatic production of angiotensinogen, increased activity of blood vessels against vasoconstrictive hormones, decreased reuptake of catecholamine degradation products, or inhibition of vasodilators such as kinins and prostaglandins[9].

Sudden discontinuation of corticosteroid use without tapering off can cause withdrawal symptoms such as secondary adrenal insufficiency due to suppression of the hypothalamic-pituitary-adrenal (HPA) axis[5,10]. Steroid withdrawal syndrome is a syndrome with symptoms of lethargy, malaise, anorexia, myalgia, headaches, fever, and skin desquamation. Sufferers have symptoms of weakness, fatigue, anorexia, nausea, and vomiting, all of which are present in the patient.

The diagnosis of exogenous Cushing's syndrome begins with clinical suspicion based on a physical examination. Exogenous Cushing's syndrome is indicated by low serum cortisol levels in the morning. ACTH levels are also relatively low since ACTH production by the pituitary is suppressed by exogenous steroids[3].

Secondary adrenal insufficiency caused by ACTH deficiency is commonly caused by exogenous glucocorticoid therapy[3,5]. This patient had a history of long-term dexamethasone use in high doses. Taking dexamethasone will result in high levels of cortisol in the blood which in turn will reduce the secretion of ACTH.

Diagnosis of adrenal insufficiency is based on the suspicion of the patient's symptoms, clinical chemistry examination, and serum ACTH and serum cortisol levels[11]. In secondary adrenal insufficiency, ACTH suppression has minimal effect on aldosterone secretion by the zona glomerulosa, therefore, there is no manifestation of mineralocorticoid deficiency. Hyponatremia and hyperkalemia rarely occur due to the reasons above[4,5]. The patient experienced low intake and vomiting which causes low potassium and magnesium levels, resulting in complaints of weakness in the 4 extremities. The weakness ameliorated after therapy and gradually improved as the patient's potassium and magnesium levels improved.

The next step after clinical suspicion of Cushing's syndrome is to prove that there is excess secretion of the hormone cortisol and impaired feedback mechanism of the hypothalamic-pituitary-adrenal axis. For initial laboratory testing, many guidelines recommend one of the following tests: two 24-hour urine-free cortisol checks, late night salivary cortisol, 1 mg overnight dexamethasone suppression test or a longer dose dexamethasone suppression test. These three tests are the most common types of initial tests to evaluate the possibility of Cushing's syndrome. They are often faced with difficulty or entirely not available in developing countries, so, pragmatically, only morning cortisol levels are checked. For morning serum cortisol, the results are quite acceptable if the results are extremely high.

Patient's history and physical examination strongly supported the diagnosis of Cushing's syndrome, but the laboratory examination did not show an increase in serum cortisol levels. The patient had a decreased level of cortisol (serum 08.00 am), namely 18.67 ng/mL. Morning serum cortisol levels indicate adrenal insufficiency caused by corticosteroid therapy when levels are below <3μg/dL (<30 ng/mL) and indicate normal adrenal function when values are >20μg/dL (>200 ng/mL)[3,4].

Serum ACTH levels are used to differentiate primary and secondary adrenal insufficiency. Ideally, an ACTH stimulation test using synthetic ACTH (Cortrosina®, Synacthen®) is carried out by first determining the baseline serum cortisol level, then injecting 250 mcg of ACTH intravenously, followed by assessing the serum cortisol level 30 and 60 minutes after ACTH administration. Normally, after an ACTH stimulation test there will be an increase in serum cortisol levels >20 mcg/dL or an increase of >10 mcg/dL from the patient's initial cortisol level (baseline). In secondary adrenal insufficiency, there is no increase in serum cortisol

levels after the ACTH stimulation test[4,6]. The limitation in this case was that the ACTH stimulation test was not performed because no synthetic ACTH was available in the Pharmacy Unit of Dr. Soetomo Hospital Surabaya.

In the presence of secondary adrenal insufficiency, serum ACTH levels are low (<5 pg/mL [1.10 pmol/L]). The patient had a decreased serum ACTH level, namely 2.1 pg/mL[12]. This supported the diagnosis of secondary adrenal insufficiency.

Conclusion

The patient was diagnosed with exogenous Cushing's syndrome based on a history of long-term use of dexamethasone. Physical examination revealed moon face, buffalo hump, purplish striae, and hypertension. Sudden discontinuation of dexamethasone causes withdrawal symptoms, one of which being secondary adrenal insufficiency as evidenced by low morning serum values for cortisol and ACTH parameters.

Influence of Exercise Classics on the Ability to Switch the Attention of Schoolchildren Aged 9-10 Years

Polevoy G.G.

Candidate of Pedagogical Sciences, Associate Professor, Department of Physical Education, Moscow Aviation Institute (National Research University), Moscow, Russia

Abstract

Background: The problem of switching the attention of schoolchildren can be solved by exercises in physical education classes at school.

Aim: To determine the influence of exercise Classics on the ability of schoolchildren to switch their attention at the age of 9-10 years.

Method: The study was conducted over a period of 9 months, in which 40 9-10-year-olds took part. Physical education classes were held 2 times a week for 40 minutes each lesson. The level of development of coordination abilities was assessed on the «Shuttle run» test, and the indicators of attention switching on the «Method of Numbers» test. The programs bio-stat 2009, Microsoft excel 2016 and t-student were used for mathematical and statistical processing of results.

Results: Before the beginning of the pedagogical experiment, the indicators of school children between the groups did not have significant differences ($P>0.05$). After the end of the study, the indicators in both groups improved. In CG, in the «Shuttle run» test, the indicators improved from 10.2±0.6 to 9.9±0.5 ($P>0.05$), and in the test for the level of attention switching, the indicators improved by 5.4% ($P>0.05$). In EG, in the «Shuttle run 3x10 m» test, the indicators improved from 9.9±0.5 to 8.5±0.4 ($P<0.05$), and in the «Method of Numbers» test, the indicators improved by 26.6%. These results indicate the effectiveness of using exercise Classics in physical education lessons in working with younger schoolchildren.

Conclusion: If schoolchildren will perform exercise Classics in physical education classes at school, they will improve not only coordination abilities, but also attention switching indicators.

Keywords: *Attention switching, coordination abilities, school children, physical education, Classics.*

Introduction

At the present stage of development of society, one of the most important tasks is the optimal level of motor activity, motor mode during the day. Unfortunately, every year more and more children with disabilities enter the first classes in a state of health, while the main problem is a lack of motor activity. It was found that the lack of motor activity significantly worsens the health of the growing human body, weakens its defenses, and does not provide full physical development. Diseases of the heart, blood vessels, lung system, and some others are progressing and becoming younger. It is impossible to fully develop schoolchildren without physical education. Physical education is an integral part of the modern Russian education system. The main form of physical exercises in school is a physical culture lesson. During the lesson, the teacher forms schoolchildren interest in physical exercises, encourages them to be

active. The main task is to ensure that children, starting from their earliest childhood, grow up healthy, strong, and harmoniously developed. Physical culture plays an important role in improving a person's health[1-2].

Schoolchildren receive the necessary minimum of knowledge, skills and abilities provided for in the school curriculum, and increase their level of physical development[3]. One of the problems of implementing modern programs is the lack of a comfortable gym for a lesson in physical culture. Some authors suggest replacing the standard program with modern method[4-5]. In our opinion, the more correct option is only to add the standard program. The effectiveness of implementing exercise Classics in physical education classes at school has been proved[6].

An individual-differentiated approach to exercise Classics is very important. Thanks to this, schoolchildren can realize the reserve potential of their body, meet the needs for physical and motor activity[7-8].

Exercise Classics allows you to develop coordination abilities – this is the ability of a person to quickly master new movements and solve motor problems that arise in unexpected and changing situations. A high level of development of coordination abilities allows you to save movement, strength, and time. The efficiency and rationality of human motor actions increases simultaneously with an increase in the indicators of coordination abilities[9-11]. It should be noted that the sensitive period for the development of most conditioning and coordination abilities is primary school age. The effect of developing such abilities will be higher if you purposefully influence them in early school age[12-13].

Motor activity has a positive effect on the mental processes of schoolchildren, it improves their thinking processes[14-15]. Some studies confirm the effectiveness of physical education for obtaining positive grades in other subjects[16].

Thus, the aim of the study is to determine the influence of exercise Classics on the ability of schoolchildren to switch their attention at the age of 9-10 years.

Material and Method

Participants: 40 children, boys and girls 9-10 years old took part in the pedagogical experiment. At the time of the study, the schoolchildren were in the third grade at normal school No. 60 (Russia). Children who had good health indicators and were able to engage in physical education at school were admitted to the study.

All procedures met the ethical standards of the 1964 Declaration of Helsinki. Informed consent was obtained from all parents of the children included in the study.

Procedure: The pedagogical experiment lasted from September to may (9 months). Classes for schoolchildren were held twice a week for 40 minutes. There were 56 physical education classes in total.

Before starting the study, two groups were formed:

1. Control group (CG) - children of class 3A (20 people). During the school year, schoolchildren were engaged in a standard physical education program at school[3].
2. Experimental group (EG) - children of class 3B (20 people). During the school year, schoolchildren were engaged in the usual program and additionally performed exercise Classics at each physical education lesson (table 1).

Table 1. Exercise "Classic's"

1	5	6		2	8	5		9	3	4	
4	8	2		7	4	1		8	2	7	
9	7	3		9	3	6		1	6	5	
Square 1				Square 2				Square 3			

Exercise Classics: In the gym, there are three large squares on the floor. The side of one square is 180 cm. Inside each large square there are nine small squares, the side of the small square is 60 cm. Inside each small square are numbers from 1 to 9.

Task: the schoolchild must use jumps from square to square to get from number 1 to number 2, then to number 3, and so on, to number 9. After that, it should jump on the same squares in reverse order (from number 9 to number 1). You can move around the squares in any way (from one leg to the other, jump on one leg or on two). If the schoolchild makes a mistake, he returns to the previous square. During the lesson, each schoolchild must overcome three large squares. The numbers in the squares must be changed by the teacher before each lesson. You can perform the exercise in any part of the lesson.

Before and after the pedagogical experiment all schoolchildren took control tests:

1. "Shuttle run 3x10 m" (indicator of coordination abilities)[17].
2. "Method of Numbers"[18].

The A4 sheet shows 2 large squares. Each square has 16 small squares with numbers from 1 to 16 written in them (table 2).

Table 2. Example of a blank in the "Method of Numbers" test

4	9	14	11
16	1	2	6
13	8	15	3
5	12	7	10

15	14	2	7
3	5	8	10
12	9	13	16
1	11	6	4

Schoolchildren should switch their attention from square to square so that they can cross out the numbers in turn, first in the left square (number 1), then in the right square (number 1). The exercise ends when the schoolchildren has crossed out number 16 in both squares. Result: the time that children spent on completing the task (0.1 seconds).

Statistical Analysis: The results of the pedagogical experiment were processed using Microsoft excel 2016, which allows you to determine the average value of the indicators of both groups. The bio-stat 2009 program allows us to compare groups and determine the reliability of the results ($P<0.05$) using the t-student parametric criterion[19].

Results

Before the beginning of the pedagogical research, all 40 schoolchildren took control tests. It should be noted that before the study, the differences in indicators between schoolchildren were not significant ($P>0.05$). After the study, the indicators changed in both classes (table 3).

Table 3 shows that the performance of schoolchildren from CG and EG improved in both tests. However, the improvement in both tests was different. In children in grade 3A who were engaged in the standard physical education program at school, the performance in the «Shuttle run» test improved from 10.2±0.6 to 9.9±0.5 ($P>0.05$). Schoolchildren who were engaged in the standard program and performed the exercise Classics in each lesson improved their coordination abilities from 9.9±0.5 to 8.5±0.4 ($P<0.05$). In the same way, the pedagogical experiment affected the indicators of switching the attention of schoolchildren. Children from CG in the «Method of Numbers» test had 5.4% higher scores ($P>0.05$), and children from EG had 26.6% better scores ($P<0.05$). Thus, we can talk about the insignificant effectiveness of the standard physical education program in secondary schools for the development of coordination abilities, and the introduction of exercise Classics in the educational process in physical education has a significant and positive effect on both coordination abilities and the ability of schoolchildren to switch attention.

Table 3. Indicators of coordination abilities and abilities of children 9-10 years old to switch attention

Test	CG				EG			
	Before	After	%	P	Before	After	%	P
Shuttle run 3x10 m (s)	10.2±0.6	9.9±0.5	2.9	P>0.05	9.9±0.5	8.5±0.4	14.1	P<0.05
Method of Numbers (s)	44.1±3.4	41.7±4.1	5.4	P>0.05	42,9±3.9	31.5±3.3	26.6	P<0.05

Discussion

Physical culture is very important for a person. The main goal of physical education is comprehensive personal development, preparation for work and life in society. Physical education classes at school are mandatory and make a significant contribution to the development of schoolchildren[1-2].

Today, the physical education program at school is a set of method, sets of exercises and rules. Some authors believe that the modern physical education program is outdated and should be replaced with modern methodics and sets of exercises. However, in our opinion, this is a very strict measure. It is enough to add only a little to the program, for example, exercise Classics which has proved to be positive in previous studies[6].

This study is new, as it is the first to study the influence of exercise Classics on the ability of schoolchildren to switch their attention. The relationship was positive. Children who performed the exercise Classics in every physical education lesson at school improved their ability to switch their attention.

Such studies confirm the data that physical culture, exercise and sport have a positive impact on the human body not only in terms of physical fitness, but also intellectual development[14-15,20-21], such children have an advantage in solving tasks that require increased mental readiness, respectively, receive more positive ratings for their abilities[16,22].

It should be noted that the authors' opinion about a favorable period for the development of coordination abilities of primary school children is fully confirmed by this study, since children in the control group who did not take additional classes were able to improve their indicators of coordination abilities[12-13].

An individual approach to working with children is used more often in high school, and in primary school age, the method of differentiated approach is more common, which also proved itself in a new study[7-8].

Conclusion

Thus, if you perform exercise Classics at each physical education lesson at school, the indicators of physical and mental development of children will improve. Specifically, indicators of coordination abilities and ability to switch attention. The new research is relevant and promising for further directions in the study of mental processes and physical abilities of schoolchildren.

Conflicts of Interest: There is no conflict of interest

Source of Funding: Self-funding

Ethical Clearance: All procedures performed in studies involving human participants were in accordance with the ethical standards of the institutional and/or national research committee and with the 1964 Helsinki declaration and its later amendments or comparable ethical standards. Informed consent was obtained from all individual participants included in the study.

Effectiveness of Teaching and Text Message Based Intervention on Dietary Habits among Overweight Adolescents in Selected Schools of Ambala, Haryana

Pooja[1], Kanika[2], Srinivasan P.[3]

[1]Former M.Sc. Nursing Student, Department of Child Health Nursing, M.M. College of Nursing, Maharishi Markandeshwer University, Mullana-133207, Haryana, India, [2]Professor, Department of medical surgical nursing, M.M College of nursing, Maharishi Markandeshwer University, Mullana-133207, Haryana, India, [3]Nursing tutor, College of nursing, AIIMS, Patna, India

Abstract

Background: Overweight and obesity is associated with an increased risk of morbidity and mortality as well as reduced life expectancy.

Objectives: The objectives of the study was to assess and compare the dietary habits among overweight adolescents before and after teaching and text message based intervention in experimental and comparison group, to determine the association of dietary habits among overweight adolescents with their selected variables in experimental and comparison group.

Methodology: A quasi experimental non equivalent control group pretest-posttest design was used for the study. Fifty nine (59) overweight adolescents were selected by using purposive sampling technique. The data was collected by rating scale to assess the dietary habits for overweight.

Results and Conclusion: The findings revealed that mean post test score of dietary habits (29.5 ± 2.55) was significantly higher in experimental group than mean post test score of dietary habits. There was a significant association found between post test of dietary habits of experimental group with BMI (p=0.02) and with age (p=0.05) in comparison group. It was concluded from the study that teaching and text message based intervention was effective in improving the dietary habits among overweight adolescents.

Keywords: *Dietary habits, overweight adolescents, teaching and text message based intervention.*

Introduction

Obesity is an independent risk factor for CVD. Obesity is associated with an increased risk of morbidity and mortality as well as reduced life expectancy. The last two decades of the previous century have witnessed dramatic increase in health care costs due to obesity and related issues among children and adolescents.[1]

Corresponding Author:
Pooja
Former M.Sc. Nursing Student, Department of Child Health Nursing, M.M. College of Nursing, Maharishi Markandeshwer University, Mullana-133207, Haryana, India

The number of overweight or obese infants and young children (aged 0 to 5 years) increased from 32 million globally in 1990 to 42 million in 2013. In the WHO African Region alone, the number of overweight or obese children increased from 4 to 9 million over the same period. The vast majority of overweight or obese children live in developing countries, where the rate of increase has been more than 30% higher than that of developed countries. If current trends continue, the number of overweight or obese infants and young children globally will increase to 70 million by 2025. Without intervention, obese infants and young children will likely continue to be obese during childhood, adolescence and adulthood. Obesity in childhood is associated with a wide range of serious health

complications and an increased risk of premature onset of illnesses, including diabetes and heart disease.[2]

With a rapid demographic and socioeconomic transition, India is becoming the epicenter of epidemics of both adult and childhood obesity, especially in urban populations. Although the age-standardized rates are low, but in absolute terms, India is the country with the third-highest level of obesity in the world. Over the years, epidemiological studies have reported a consistent increase in the prevalence of childhood overweight and obesity in the subcontinent.[3]

This rising trend in developing countries is largely due to rapid urbanization and mechanization which led to reduction in energy expenditure along with increase in energy intake in the form of high calorie snack and junk food.[4]

Overweight and obesity result from an energy imbalance. The body needs a certain amount of energy (calories) from food to keep up basic life functions. Body weight tends to remain the same when the number of calories eaten equals the number of calories the body uses or "burns." Over time, when people eat and drink more calories than they burn, the energy balance tips toward weight gain, overweight, and obesity. Children need to balance their energy too, but they are also growing and that should be considered as well. Energy balance in children take place when the amount of energy taken in the form of food or drink and used by the body in natural growth without promoting excess weight gain. Many factors can lead to energy imbalance and weight gain. They include genes, eating habits, how and where people live, attitudes and emotions, life habits, and income.[5]

More and more children and teenagers nowadays are becoming a prey to bad eating habits and tend to consume fast foods instead of eat a healthy diet. These junk foods which are rich in fast carbohydrates and fat are considered as the major reason for childhood obesity. Nowadays, children spend much of their time in front of the TV or on their gaming consoles instead of taking part in exercise, which causes them to gain extra pounds.[6]

Recent research finds that adolescents are following poor dietary habits and on a routine basis which is a contributing factor for them becoming overweight.

Fast foods affect children and youth often worse than adults. This is because most of the fast foods are targeted towards children and there is a sustained pattern of eating fast foods and eating out. Children with a sustained excess energy imbalance, intake of approximately 2% result in the development of obesity over time. A 2% imbalance could mean an excess of only about 30 kilocalories per day. This corresponds to two-thirds of a chocolate cookie, fewer than two French fries or one-fourth of a can of soda. Eating out is another major contributor to childhood obesity. Studies show that calorie content of out-of-home meals that children consumed was 55% higher than that of in-home meals.[7]

By 2025, India will have over 17 million obese children and stand second among 184 countries where the number of obese children are concerned, says a study published in Pediatric Obesity, an international journal. According to Global Burden of Disease collaborative for 2000 and 2013, estimated that by 2025, some 268 million children, aged between five and 17 years, may be overweight, assuming that no policy interventions have proven effective at changing the current trend. China has the largest number of children who are obese. The estimation of the likely numbers of children in 2025 with obesity-related comorbidities: impaired glucose tolerance (12 million), type 2 diabetes (4 million), hypertension (27 million) and hepatic steatosis (38 million). The global overweight prevalence for children aged 5–17 years rising from 13.9% in 2010 to 15.8% in 2025. On the assumptions of continued population growth given by the World Bank, this translates to a rise from some 219 million children in this age group in 2010 to 268 million children in 2025. Obesity alone rises from 76 million children (4.8%) in 2010 to 91 million (5.4%) by 2025.[8]

A cross - sectional study was conducted on Fast Food Consumption, Quality of Diet, and Obesity among Isfahanian Adolescent Girls. Results showed that individuals in the highest quartile of fast food intake had significantly lower NARs for vitamin B_1 ($P = 0.008$), phosphorus ($P = 0.0250$), selenium ($P < 0.001$) and vitamin B_2 ($P = 0.012$) compared with those in the lowest quartile. Those in top quartile of fast food intake consumed more energy-dense diets than those in the bottom quartile ($P = 0.022$). High intakes of fast foods were significantly associated with overweight (top quartile: 40% versus bottom quartile: 0%, $P = 0.0001$) and obesity (11.4% versus 2.9%, $P = 0.0001$).[9]

Material and Method

The study was conducted in January 2017 in the state Haryana, India. A sample of 60 (analyzed 59 due to attrition of one adolescent) overweight adolescents (13-16 years of age) participated in the study with the prior permission from the Principals of participating schools. The ***ethical clearance*** was obtained from university research ethics committee of Maharishi Markandeshwar University Mullana, Ambala (MMU/IEC/775) and the study was carried out in accordance with the guidelines laid by Indian Council for Medical Research ICMR (2006). The assent was taken from the overweight adolescents and telephonic consent was taken from the parents prior to the study. A quasi experimental Non Equivalent Control Group Pretest-Posttest Research Design was used in this study. The overweight adolescents who were in the age group of 13-15 years and were studying in selected schools of Mullana/Ambala and were available to be accessed as study subjects. The overweight adolescents who were not regular to school were excluded from the study. Fifty nine (59) overweight adolescents were enrolled in the study. Out of which 30 were enrolled in experimental group and 29 were enrolled in comparison group on convenient basis. Data was collected by using **rating scale** to assess dietary habits for overweight. Reliability of the tool was established by Cronbach's alpha and was found to be 0.74 (acceptable range is 0.07-1.00).

Statistical Analysis: According to the objectives, hypothesis of the study and opinion of the expert, it was planned to organize, analyze and interpret the data by using both descriptive and inferential statistics i.e. frequency, mean, median, standard deviation, chi-square, ANOVA and 't' test.

Results and Discussions

Homogeneity between the experimental and comparison group was checked by x^2 test in terms of selected variables that is age, gender, religion, total family income per month (in rupees), number of siblings, birth order, type of family, dietary habits, kind of medication taken, other health risk habits, mother's educational status, father educational status, mother's occupation, father's occupation, place of living, height, weight, Body Mass Index. There was no significant difference between experimental and comparison group in terms of selected variables at 0.05 level of significance which infer that both the groups were homogenous in terms of selected variables except number of siblings (p=0.01), mother's educational status (p=0.004) and place of living (p=0.00).

There was no significant difference between experimental and comparison group in terms of selected variables at 0.05 level of significance which infer that both the groups were homogenous in terms of selected variables except number of siblings (p=0.01), mother's educational status (p=0.004) and place of living (p=0.00).

Percentage distribution of experimental and comparison group in terms of level of dietary habits is shown in figure 1. Majority of overweight adolescents in both experimental and comparison group were following unhealthy dietary habits i.e. 90% and 89.65% respectively.

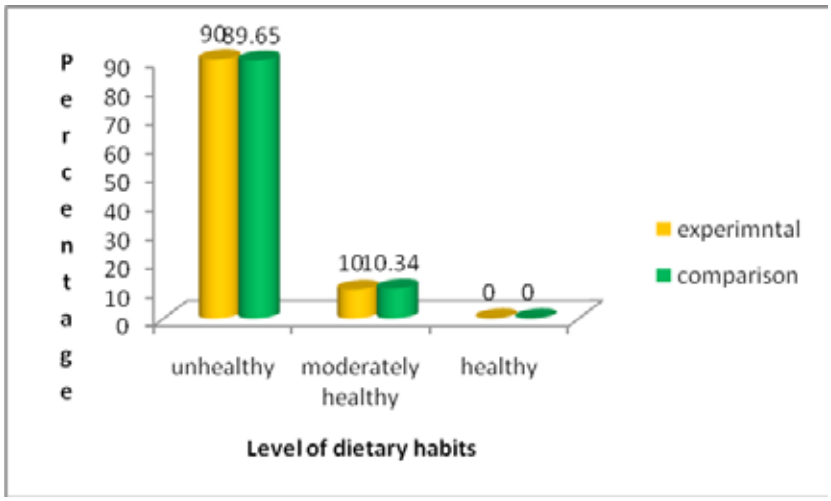

Figure 1: Pre test score of level of Dietary Habits before Administration of Teaching and Text Message Based Intervention

Majority of overweight adolescents in experimental group were following healthy dietary habits i.e. 26(86.66%) whereas in comparison group majority of adolescents were following unhealthy dietary habits i.e. 27(93.1%) after administration of teaching and text message based intervention. [Figure 2].

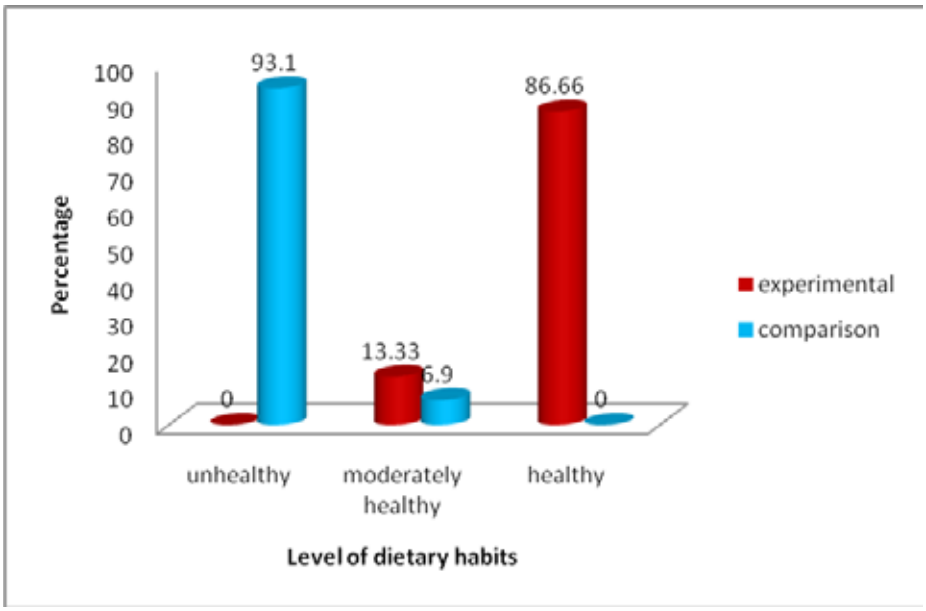

Figure 2: Post test score of level of Dietary Habits after Administration of Teaching and Text Message Based Intervention

In order to find out the significant difference between experimental and comparison group in dietary habits after teaching and text message based intervention independent 't' test was applied which is shown in table 1.

Table 1: Mean score of dietary habits after teaching and text message based intervention among overweight adolescents in experimental and comparison group N=59

Variable	Group	Mean	M_D	SD_D	SE_{MD}	't' value	p value
Dietary Habits	Experimental (n=30) Comparison (n=29)	29.53 13.10	16.43	5.97	2.34	19.44	0.001*

't'(57)= 2.00 *- significant ($p \leq 0.05$)

The table shows that there was a significant difference between experimental and comparison group in dietary habits after teaching and text message based intervention as computed 't' value **19.44** was higher than the tabulated 't' value **(2.00)** at 0.05 level of significance.

Further, paired 't' test was applied to find out the significant difference within the experimental group which is shown in table 2.

Table 2: Mean pre test and post test scores of dietary habits among overweight adolescents in experimental group n=30

Variable	Assessment	Mean	M_D	SD_D	SE_{MD}	't' value	P value
Dietary habits	Pre Test Post Test	13.60 29.53	15.93	4.46	0.81	19.58	0.001*

't'(57)= 2.05*- significant ($p \leq 0.05$)

The table shows that there was a significant difference between pre test and post test in dietary habits in experimental group as calculated 't' values was 19.58, p=0.001 which was higher than the tabulated values (2.05) at 0.05 level of significance.

In order to find out the association of dietary habits among overweight adolescents with their selected variables one way ANOVA and 't' test were applied as shown in table 3.

Table 3: ANOVA and 't' test value showing association of dietary habits among overweight adolescents with selected variables N=59

S.No.	Variable	Mean	F/t	p value
Experimental group (n=30)				
1.	**Body mass index (BMI)**			
1.1	Overweight	30.00	2.40	0.02*
1.2	Obese	27.20		
Comparison group (n=29)				
2.	**Age**			
2.1	13	13.33		
2.2	14	11.93	3.27	0.05*
2.3	15	17.67		

t (28)= 2.00, t(27)=2.05 *- significant (p≤0.05)

There was no significant association of dietary habits with selected variables was found except body mass index i.e. p=0.02 which was found to be significant at 0.05 level of significance. Similarly, in comparison group all variables found to be non- significant except age i.e. p=0.05 which was found to be significant at 0.05 level of significance. Hence, dietary habits of overweight adolescents were dependent on BMI and age.

Additionally, Post Hoc test was applied to reveal the mean difference of significant association in comparison group (age group) which is shown in table 4.

Table 4: Post hoc test showing significant mean difference in association of Dietary Habits for Overweight with selected Variables (age in comparison group) n=29

S.No.	Selected variable	Category	MD	SE	p value
1.	Age	13 Vs 14	1.40	1.39	0.58NS
		13 Vs 15	-4.33	2.29	0.16 NS
		14 Vs 15	-5.73	2.26	0.04*

NS- non significant (p>0.05), *- significant (p≤0.05)

It concluded that age group of 15 had healthy dietary habits than the age group of 14.

Discussion

The present study aims to evaluate the effectiveness of teaching and text message based intervention on dietary habits among overweight adolescents in selected schools of Ambala, Haryana.

In the present study, morethan half of the overweight adolescents in experimental and less than half of overweight adolescents in comparison group were in the age group of 14 i.e. 16(53.3%) and 14(48.3%) respectively. More than half of the overweight adolescents in experimental group were males 19(63.3%) whereas in comparison group most of the overweight adolescents were females 17(58.6%).These findings are contradictory to a cross-sectional study conducted by Natalija Smetanina, Edita Albaviciute, Veslava Babinska et al (2010) on Prevalence of overweight/ obesity in relation to dietary habits and lifestyle among 7–17 years old children and adolescents in Lithuania. The study results showed that overweight, and obesity among boys and girls was 12.6 and 12.6 % *(*p> *0.*05), and 4.9 and 3.4 % (p < 0.05), respectively. Obesity was significantly more prevalent in the 7–9 years old group (6.7 and 4.8 % in boys and girls, respectively, p< 0.05).[10]

In the present study, in dietary habits, there was a significant association among overweight adolescents with all variables except body mass index i.e. in experimental group and age in comparison group were found to be significant. The study findings were equally supported and contradictory to a cross-sectional study conducted by Natalija Smetanina, Edita Albaviciute, Veslava Babinska et al (2010) on Prevalence of overweight/obesity in relation to dietary habits and lifestyle among 7–17 years old children and adolescents in Lithuania. Lower meals frequency and breakfast skipping were directly associated with overweight/ obesity (p< 0.05).[10]

Conclusion

There was a significant difference in the mean score of dietary habits before and after teaching and text message based intervention. Hence, teaching and text message based intervention was effective in improving the dietary habits among overweight adolescents.

Acknowledgement: The authors express their deepest sense of gratitude to Mr. Dhanesh Garg

(Associate Professor, department of Statistics) M.M. College of Nursing (Mullana, Ambala), Principals of both the schools and genuine thanks to Mr. Asir John Samuel, Assistant Professor, Maharishi Markandeshwar Institute of physiotherapy and Rehabilitation, Maharishi Markandeshwar University for timely support in completion of the study.

Ethical Consideration: The ethical clearance was obtained from university research ethics committee of Maharishi Markandeshwar University Mullana, Ambala (MMU/IEC/775) and the study was carried out in accordance with the guidelines laid by Indian Council of Medical Research ICMR (2006). The permission was taken to conduct the study in the MM International School, Mullana and The S.D. Vidya School, Ambala Cantt (from Principals of the Schools). The assent from children and telephonic consent from their parents was collected prior to the study. The purpose for carrying out research project was explained and assurance of confidentiality was given to the participants.

Changing Trends Inpoisoningat a Tertiary Healthcare Centrein North Karnataka, India

Pratibha R. Kulkarni[1], Ranganath R. Kulkarni[2], R.B. Kotabagi[3]

[1]Assistant Professor, Department of Forensic Medicine, [2]Associate Professor, Department of Psychiatry, [3]Professor and Head, Department of Forensic Medicine, Shri Dharmasthala Manjunatheshwara University, Dharwad-580009, India

Abstract

Background: Acute poisoning is a medical emergency as well as a major public health problem as it leads to significant burden on healthcare services. It is pertinent to know the nature and outcome of poisoning for effective prevention and management strategies.

Method: A comparative retrospective analysis of 622 poisoning cases admitted to a tertiary care hospital during the period from 2011-12 and 2018-19 were compared to assess the age, sex, mode of poisoning and the nature of the poisonous substance.

Conclusion: The study reveals a sharp increase in the acute poisoning cases and changing trends of commonly used poisons with passage of time. Although, males outnumbered females, a steep rise in female poisoning cases, with majority (60%) being young adults especially in the age group of 21-30 years is alarming. Suicide was the most common manner of poisoning, while organophosphates and medicinal drugs were the most commonly used substances.

Keywords: *Drug overdose; Organophosphates; Pesticides; Poisoning; Prescription drug misuse; Suicide.*

Introduction

Poison and poisoning are known to mankind since times immemorial. Mortality and morbidity due to acute poisoning has tremendous medical, legal and social significance. Intentional ingestion of pesticides is estimated to account for one in five of all suicides globally.[1] India, being mainly an agrarian country, with majority of the population belonging to rural areas, has witnessed poisoning due to conventional insecticides like organophosphates. However, in the past few years, with the advent of newer agricultural poisons and easy availability of pharmacological products to an educated population, remarkable changes have occurred in the trends of acute poisoning. The present day poisoning trends pose a challenge in the diagnosis, treatment and availability of analytical facilities in developing countries.

The changing trends need to be studied on regional basis as knowledge of the general patterns of poisoning in a particular region would help in proper healthcare policy planning, so as to equip the healthcare centres for early diagnosis and effective treatment, which in turn would result in a reduction in morbidity and mortality. The present study was an attempt to analyze the change in the commonly used poisonous substancesacross two time periods.

Materials and Method

The present study is a comparative, retrospective chart review across two time periods. All cases of poisoning admitted to SDM College of Medical

Sciences and Hospital, a tertiary healthcare centre at Dharwad, Karnatakafrom January 2011 to December 2012 and January 2018 to December 2019were included for the study. Cases due to snake bite envenomation and/or other insect bites were excluded from the study. Socio-demographic details such as age, gender, marital status, occupation, manner of poisoning and type of poisonous substance consumed were collected from the hospital records. Data was tabulated and analysed using descriptive statistics with statistical significance of p value at <0.05. Chi-square test was applied to compare the groups and sub-groups depending on nature of the variables involved. Ethical clearance for the study was obtained from the Institutional Ethics Committee.

Results and Discussion

A total of 2963 medico-legal cases were registered during the period 2011-12, of which poisoning cases accounted for 6.88% (n=204), in comparison to 4697 medico-legal cases during the years 2018-19 where poisoning cases accounted for 8.9% (n=418), suggesting asignificant rise of 2.02% in poisoning cases during 2018-19(χ^2=3.89; df=1; p<0.05). This sharp uptrend in the recent years could be due to various reasons like rising population, increasing demands, competition amongst people to perform better, work pressure,intra/ inter-personal conflicts thereby leading to frustration intolerance, rejection sensitivity, depression and suicidal tendencies.

Young adults formed the majority in both the groups accounting for one-third of the cases, with most common age group being 21-30 years [Table 1], which is in concordance with most Indian studies like that done in south India,[2] and that done in north India,[3]possibly due to stressors like professional failure, failure in love or competitive exams, and family discordance suffered by people in this age group.

Of a total 622 poisoning cases, males (n=329; 52.89%) outnumbered females (n=293; 47.11%) during both the time periods. The higher incidence in males could be due to the fact that males are more exposed to stress and strain due to financial difficulties, workplace stress and/or discord at home. This is in concordance with other Indian studies.[4,5] During the years 2011-12, males (n=114; 55.89%) outnumbered females (n=90; 44.11%) with a ratio of 1.26:1, in comparison to males (n=215; 51.43%) and females (n=203; 48.57%), with a ratio of 1.05:1 during the years 2018-19. This finding showed statistical significance across age groups in total cases (χ^2=15.04; df=6; p<0.05) and female gender(χ^2=18.59; df=6; p<0.05), but not in males (χ^2=3.19; df=6; p>0.05) [Table 1]. This implies rising trends of poisoning cases across all age groups, especially in female gender in recent years, thereby suggesting females as almost equally affected as males. As majority of females in present study were housewives, possibly they were prone to suffer from loneliness and depression, alcoholism by husband, financial difficulties, abuse by spouse or in-laws in connection with dowry, etc. This finding is in agreement with an Indian study that reported females as being the commonest victims.[6]

Poisoning was more common in the married group in both time periods, although statistically no significant difference was found between two time periods [Table 1]. This finding is consistent with studies done in other parts of India as well.[7,8] This may imply that maladaptive stressful marital life can act as a triggering factor for suicidal behaviour in vulnerable individuals, especially in the Indian context where an early marriage along with its added familial responsibilities can be synergistic factor.

In present study, self-ingestion was the commonest manner of poisoning, especially among adults and elderly; only few were accidental(especially among children) and none were homicidal in both the groups [Table 1]. This is in agreement with other Indian studies.[3,9] Possibly, people resort to suicidal attempts by poisoning due to many reasons like easy availability and accessibility to poisonous substances, lower need for strenuous efforts compared to other suicidal acts, their belief that poison terminates life with minimal suffering. It is also quite possible that few amongst accidental poisoning victims might have under reported their suicidal behaviour due to sensitivity of stress, social stigma of suicide and fear of legal procedures thereto. However, in an Indian study although majority of the poisoning cases were accidental in nature, deaths were more in poisoning of suicidal manner.[5] This may be due to the differences in study design, psychiatric consultation, tactic eliciting of clinical history and stressful factors that have major influences in categorising the manner of poisoning act as suicidal or accidental or homicidal.

During the years 2011-12, majority of the poisoning cases were farmers (n=57; 27.94%) compared to housewives (N=140, 33.49%) during the years 2018-19 [Table 2]. There was a statistically significant difference

between the two study periods in relation to occupation and poisoning. India being an agrarian country, farmers have easy access and occupational exposure to the poisonous substances like pesticides, insecticides, or rodenticides and thus are commonly affected victims. In the recent years, with increasing incidence of poisoning in the female population, housewives comprised the vulnerable group. However, some Indian studies reported manual labourers to be more commonly affected than others,[4,10] while another Indian study reported students and unemployed youths as the most common victims[11]. These differences can be due to different study settings and methodologies.

Organophosphorus compound was the commonest poison in both the time periods, owing to its easy availability [Fig. 1]. This finding is consistent with most of the Indian studies,[5,10] although studies from northern parts of India have reported aluminium phosphide as a common cause of poisoning[8]. Rise in drug overdose cases is gaining popularity in recent years as a means of poisoning in majority of victims in their second and third decades, especially in students and housewives.[12] This could possibly be due to easy availability and accessibility to all types of medicines over the counter with no strict law enforcement to check prescription delivery, and risk factors like academic stress, unhealthy competition, failure in relationships,and family conflicts. Such individuals are prone for depression and have an access to psychiatric drugs. Common tablets that were consumed included psychotropic medications (benzodiazepines, anti-depressants, anti-psychotics, carbamazepine, valproate), paracetamol and antihypertensives. This study also observed a rising trend in consumption of non-conventional, local-made pesticides that have no mention of the ingredients leading to therapeutic challenges that funnels mostly on clinical presentation.

During the years 2011-12, mortality was noted in 14 cases (6.9%), of which 12 cases (85.71%) were due to organophosphate poisoning, compared to 28 cases(6.7%) during in the years 2018-19, of which 17 cases (60.71%) were due to organophosphorus poison and 6 cases (21.43%) due to other pesticides. Although some studies have reported higher mortality rate of 15%,[4,10] lower mortality in our study could be due to early accessibility to health centre, early therapeutic interventions and sophisticated tertiary care centre facility.

Figure 1: Changing trends in distribution of poisoning cases by type of poisonous substance

Conclusion

The study on changing trend in poisoning will give an idea about the current patterns which would help in early diagnosis by the common clinical manifestations associated with it and will also help in developing the analytical method used for detecting the poison. Rising trend in the number of poisoning cases over the recent years, especially drug overdose and local-made pesticides is quite alarming.

The study also highlights the importance of proper labelling of the ingredients and restricting the sale of non-conventional agricultural poisons along with proper education about safe handling as well as hazards of agricultural poisons. Strict legislative measures must be implemented regarding the sale of 'over the counter' drugs to tackle the recent rising trend of drug overdose. Epidemiological surveillance is necessary for every region to identify problems prevalent in that region, so that preventive measures can be taken accordingly.

Approach to Patients with Hemorrohoids at Our Teritary Care Centre

Pratik Shaparia[1], Brijesh Bharodiya[2], Vipul Gurjar[3], Honeypalsinh H. Maharaul[4]

[1]Assistant Professor, [2]Resident, [3]Professor, [4]Associate Professor, Smt. B.K. Shah Medical Institute and Research Centre, Sumandeep Vidyapeeth Deemed to be University (an Institution), Pipariya Vadodara

Abstract

Haemorrhoids is considered to be one of the most common surgical condition nowadays. Its prevalence is 4.4% i.e. 10 million world population. The purpose of this study is to observe outcomes of various procedures and conservative management in patients respective to their grades of haemorrhoids. In our setup we used dietary and lifestyle modification, Medications (Topical/Systemic) stapled haemorrhoidopexy, Milligan Morgan Hemorrhoidectomy.

Keywords: *Haemorrhoids, Treatment, Outcomes, Complications.*

Introduction

Haima (bleed) + Rhoos (Flowering) are the greek words for origin of word Haemorrhoids which means bleeding from flowered like structure. 'Pila' is the word of origin for Piles in latin vocabulary(1). Haemorrhoids are normal Vascular tissue within the submucosa located in anal canal(2). Displacement or enlargement of anal cushions results to development of haemorrhoids. Anal Cushions normally resides in left lateral, right anterolateral, right posterolateral and are aggregation of blood vessels (arterioles, venules), smooth muscles and elastic connective tissue in submucosa (3). Many people have features of piles on proctoscopy but may or may not have symptoms so exact prevalence of haemorrhoids is difficult to evaluate. Sometimes patient with portal hypertension develop per rectal bleeding but that is due to rectal varices and not to be confused with haemorrhoids (4). They can be mucosal or vascular. Vascular type is seen in young whereas mucosal in old age people. Present concept is weakening of Park's ligament which is lower end of external sphincter. Basically, there are 2 types- 1) Internal- Above dentate line, covered with mucous membrane. 2) External- below dentate line, covered with skin. Other way of classification is 1) Primary- located at 3,7,11'0 clock position related to branches of superior hemorrhoidal vessel which divides into 2 branches on right and 1 on left side. 2) Secondary- one which occurs between primary sites.

Grades of haemorrhoids- Grade 1- Piles bleed but doesn't come out. Grade 2- Piles that prolapse during defecation but returns back on its own. Grade 3- Piles that prolapse on defecation and can be replaced back manually. Grade 4- Piles that are permanently prolapse. Specific considerations like acutely thrombosed or strangulated internal haemorrhoids, acutely thrombosed external piles, Pregnancy induced piles, various underlying liver disorders like portal hypertension and cirrhosis, patients on various anticoagulants and antiplatelets medications.

Modes of treatment used are- 1) Dietary and Lifestyle modifications which includes high fibrediet, increase oral fluid intake, and also avoid constipation and cough, Warm Sits bath with anal region dipped in water for 20 minutes, 2-3 times a day 2) Medical Management includes topical application to reduce pain, oedema, itching. Oral Antibiotics, Laxatives, NSAIDs are also used. 3) Stapled Haemrrhoidopexy (Antonio Longo)-

circumferential excision of mucosa and submucosa 4 cm above dentate line using circular Haemorrhoidal stapler passed per anally (MIPH- Minimally Invasive procedure for haemorrhoids) which is less painful, less blood loss, faster recovery, short hospital stay and equally efficacious. Ring formed as a result of staplers restores the downward displaced tissue back to its place and thus both anatomical and functional integrity is maintained.([5]). But it need advanced surgical skill experience, costlier, may cause full thickness excision of rectal wall, may injure anal sphincter and improper purstring can cause incomplete doughnut leading to severe haemorrhage and it is contraindicated in associated anorectal diseases like fissure, fistula in ano. 4) Milligan Morgan Open Hemorrhoidectomy which involves ligation and excision of piles and anal mucosa and skin is left open to heal by second intention. Some RCTs and meta-analyses stated that this method is best for patients with recurrent symptoms of grade 3 and 4 Hemorrhoids(6). It is also recommended in patients with mixed grades of hemorrhoids and for patients in whom other treatments failed.[(7)(8)]

Perianal pain while defecation, muscular or sphincter injury, per rectal bleeding, recurrence, bleeding or painful anal fissure, faecal incontinence can occur as post operative complications.

Materials and Method

The study is prospective study conducted at Dhiraj general Hospital of 100 patients of haemorrhoids fitting into this study requirements according to inclusion and exclusion criteria.

Inclusion Criteria:

1. Patients above 16 years of age of either sex.
2. Suffering from any Grade of Haemorrhoids.
3. Fit for Anesthesia if planned for Surgical Intervention.
4. Patients available for follow up

Exclusion Criteria:

1. Cases with active Per anal wound infection.
2. Mentally ill patients/any cognitive impairment.

Observation and Results

	Grade 1	Grade 2	Grade 3	Grade 4	Specific considerations
M1	Yes	Yes	Yes	Yes	Yes
M2	Yes	Yes			
M3		Yes	Yes	Yes	
M4		Yes	Yes	Yes	Yes

M1- Dietary and lifestyle modifications, M2- Medical Management, M3- Stapled Haemorrhoidopexy,
M4- Milligan Morgan Hemorrhoidectomy

Figure 1: Showing prolapsed hemorrhoids

Figure 2: Showing hemorrhoidal stapler used for stapler haemorrhoidopexy

Conclusion

1. Dietary and lifestyle modification is necessary and helpful for all grades and specific considerations.
2. Medical management is useful for only Grade 1 and 2
3. Stapler and Milligan Morgan both are useful in Grade 2,3,4.
4. Only Milligan Morgan Hemorrhoidectomy is useful in Specific considerations.

Behaviours (Cognitive, Affective and Psychomotor) among Patients with Gout Arthritis in Elderly

Chilyatiz Zahroh[1], Asmaul Faujiyah[1], Ima Nadatien[1], Yasi Anggasari[1], Nur Ainiyah[1], Siti Nurjanah[1]

[1]*Lecturer, Faculty of Nursing and Midwivery, Universitas Nahdlatul Ulama Surabaya, Surabaya, Indonesia*

Abstract

The phenomenon that occurs in the community at this time, many elderly gout arthritis as many as 41 of 61 elderly people in Posyandu Wonokromo Surabaya Indonesia who still complain of joint pain suddenly and stiffness in the joints that causes limited movement. This study aims to describe the behavior (cognitive, affective, and psychomotor) of patients with gout arthritis in the elderly. The design of this study uses descriptive research with cross sectional approach. The population in this study were 41 elderly with gout arthritis. The sample in this study were all elderly patients with gout arthritis, with a large sample of 41 respondents. Sampling with Total Sampling technique. This research instrument used a questionnaire and data analysis using descriptive statistics. The results showed that of 41 elderly people with gout arthritis almost half had low cognitive behavior (48.7%), almost half had moderate affective behavior (46%), and almost half had moderate psychomotor behavior (46%). The conclusion of the research is that the elderly who suffer from gout arthritis have low cognitive behavior, moderate affective behavior, and moderate psychomotor behavior. It is expected that all elderly people with gout arthritis, in order to always improve their ability and continue to shift information about the disease gout arthritis in order to improve health and change behavior (cognitive, affective, and psychomotor) to be high.

Keywords: *Behaviours, Elderly, Gout Arthritis.*

Introduction

Staying healthy and happy in old age is a challenge[1]. Elderly tend to experience health problems caused by decreased function due to aging process, therefore the body will accumulate more metabolic and structural distortion called degenerative diseases[2]. Degenerative diseases that are rapidly developing in the elderly present one of which is gout arthritis[3]. Elderly people with Gout arthritis should have a high level of cognitive, affective, and psychomotor behavior in their health. Eating a drink or high food purine (meat, nuts, organ meats, etc.) and a lack of physical activity (exercise) is a negative behavior and harmful to the health of the elderly people with gout arthritis. In fact, in the community are found many elderly people who are gout arthritis who still consume drinks or food purine high and lazy activities. So many elderly Gout arthritis sufferers still complain of sudden joint pain (big toe joints, ankles, knees, elbows, wrists, and fingers), feel warm, and stiffness in the joints causing limited movement. Eating foods and high food purine and lazy activities is a habit that is bad for health as well as the incidence of gout arthritis disease in elderly in Indonesia tends to increase. Good health behavior in the elderly is required by each community to emphasize and decrease the incidence rate of gout arthritis[4].

Gout is a term used for a group of metabolic disorders characterized by elevated uric acid concentrations (hyperuricemic). Gout or uric acid is a disease caused by the filling of the monosodium uric crystals in the body, causing joint pain called gout arthritis[4]. Common factors that because gout include lack of sleep, which can lead to lactic acid buildup. When sleeping, there is a breakdown of lactic acid in the body. If a person experiences

Corresponding Author:
Chilyatiz Zahroh
Lecturer, Faculty of Nursing and Midwivery, Universitas Nahdlatul Ulama Surabaya, Surabaya, Indonesia
e-mail: chilyatiz@unusa.ac.id

adequate sleep, the decomposition of lactic acid in the body will be perfect. If a person experiences less sleep, lactic acid has not been perfectly described so that there is a buildup of lactic acid in the body. Buildup of lactic acid in the body can prevent the production of uric acid through urine. Outside factors can be consumption of food and beverages that can stimulate the formation of uric acid such as foods that have high protein levels including nuts, emping, Melinjo, chocolate, and Drink cola. Consuming food of high purine will cause increased levels of uric acid in the blood, which causes the occurrence of crystallization in the joints. Protein especially derived from animals can increase the levels of uric acid in the blood including the liver, kidneys, brain, lung, and Spleen (Helmi, 2012). It affects the daily activities of the elderly[5,6].

Health research data in east Java province states that 32.7% of joint diseases cause insecurity in the elderly[7]. Based on the initial data retrieval conducted by the researchers on 03 December 2019, in Wonokromo, Surabaya. There is elderly who suffer from gout arthritis disease which is as much as 41 from 61 elderly. The phenomenon obtained by researchers from interviews in elderly people with gout arthritis, that the behavior of health is still low because the elderly in RW. 05 Wonokromo Surabaya is rarely get information about Gout arthritis disease and low education level. Efforts that can be made to overcome gout arthritis is to change the behavior. Behavior is complex, including cognitive, affective and psychomotor[8]. The purpose of this research was identifying cognitive, affective, and psychomotor behaviors in the elderly with gout arthritis.

Method

The design of this research uses descriptive research with cross sectional approaches. The population in this study is elderly people with a gout arthritis of 41 elderly. The samples in this study were all elderly sufferers of gout arthritis, with large samples of 41 elderly sufferers of gout arthritis. Sampling with Total Sampling techniques. This research instrument uses questionnaires and data analysis using descriptive statistics. The research variables used are behaviors (cognitive, affective, and psychomotor) sufferers of gout arthritis in elderly.

Results

Table 1. Demographic characters of respondents.

Socio-demography	Category	N	%
Age (years old)	45-59	4	7.3
	60-74	25	61
	75-90	13	31.7

	Low	20	48,7
Affective	High	7	17
	Middle	19	46
	Low	15	37

Variables	Category	Frequency	Percentage (%)
Psychomotor	High	6	15
	Middle	19	46
	Low	16	39

Discussion

Behavior (Cognitive): The results of Table 1 study showed that from 41 elderly people with gout arthritis, almost half (48.7%) Elderly Gout arthritis sufferers have low cognitive behaviors. This is demonstrated by the result of recapitulation of data from the Cognitive Questionnaire positive Statement (knowledge and understanding) Number 1, 2, 3, (application) Number 5, (analysis) number 7, (synthesis) Number 10, and (evaluation) Number 11 almost half the elderly sufferers Gout arthritis replied "Disagree", in accordance with the statement of researchers supposedly elderly people gout arthritis replied "Agree". Supported by the theory that Gout arthritis is a disease caused by the saving of the monosodium vein in the body, causing joint pain characterized by the presence of redness and feeling hot [8]. Gout arthritis disease can be caused by eating habits of high food purine (beans, melinjo, organ meats) and high-alcoholic beverages (drinks containing alcohol)[8]. Elderly people with Gout arthritis is easy injuries [9], therefore every exercise should be warming up first. If the elderly lifestyle sufferers Gout arthritis well, then the low risk of complications occurs. Eating nutritious food, regular exercise is a behavior with respect to the improvement and maintenance of elderly health patients with Gout arthritis[1,9].

While on the negative statement (knowledge and understanding) Number 4, (application) Number 6, (analysis) number 8, (synthesis) Number 9, and (evaluation) number 12 almost half the elderly patients Gout arthritis answered "agree", in accordance with the statement of researchers should elderly people gout arthritis answered "disagree". Supported by the theory of Fitriana (2015) The endurance of one's body grows increasingly declining, so that gout arthritis disease is largely suffered by the elderly. The physical and mental health condition of a person affects the health condition of the body, because when a person suffers from a disease there will be mental health decreases (stress) so it can cause new illness or complications[10].

Behavior (Affective): Based on table 1 shows that of 41 elderly sufferers of gout arthritis, almost half (46%) Have moderate affective behavior. It is indicated by the recapitulation of the data from the affective questionnaire of positive statements (understanding) Number 2, (participation) Number 3, (assessment/ determination of Attitude) Number 5, (organization) Number 7, and (the formation of living patterns) Number 9, 10, 12 almost half of the sufferer Gout arthritis in the elderly answered "disagree", in accordance with the statement researchers should be gout arthritis in elderly answered "agreed". The elderly experienced a variety of physical and mental changes. Spiritual development in the elderly, among other developments achieved at this level elderly can think and act by giving examples of ways of loving and giving justice. In the elderly there are also changes that require themselves to adapt continuously. If the process of adjusting yourself with the environment is less successful, it will arise problems. The problems and individual reactions to him will vary greatly depending on his personality. The elderly will be pleased when participating in activities held in the elderly Posyandu, because when attending the activities, the elderly can find and observe a variety of new things such as the counseling or sports together. Elderly often feel unconfident in conveying complaints of illness suffered, with the activity can help elderly in presenting related problems or diseases suffered today, so that at home elderly already know what things to obey.

While on the negative statement (understanding) Number 1, (participation) Number 4, (assessment/ determination of Attitude) Number 6, (organization) Number 8, and (the formation of living patterns) Number 11 Almost half of the sufferer Gout arthritis in the elderly answered "agree", in accordance with the statement researchers should be gout arthritis in elderly replied "disagree". The elderly thinking process is easy to change, so it can be known when the elderly suffers from a disease of a love by people around then the elderly will feel disliked and the elderly are not interested in responding, because the elderly think that he has felt capable in the problems that he suffered. Elderly are also subjected to changes in sensory system especially

in vision, when observing elderly images/objects often have errors in the meaning of them[11].

Assessment of affective behavior can be seen through the observation method and interviews in patients directly about the appearance, speech, nature of feelings, perception, and others. The decline in the affective behavior will be evident in the elderly (over 60 years). The above theory is in line with the research results showing that 25 respondents (61%) That is 60-74 years old, decreased affective behavior showed slow speech, motor activity: Tick and lethargic and natural feelings of fear and sadness but the affect shown flat. Based on cross-tabulation results between the ages and the most affective behavior (60%) Early age groups (60-64 years) are in medium category. The opinions are also similar in line with those found by Islamic Guidance and Counseling who conducted research at the Tresna Werdha (BPSTW) Protection Hall of Ciparay Bandung, finding some elderly aged over 60 years experiencing decreased affective behavior such as feelings of sadness and fear in the face of diseases that he suffered.

Nurses play an important role in providing teaching or understanding to the elderly about the importance of maintaining mental health in connection with the decline of affective behavior, so that the elderly do not suffer from impaired affective functions such as feelings of sadness and fear during the illness of Gout arthritis. Thus, the elderly will achieve a good degree of mental health in his old age and have high affective behavior

Behavior (Psychomotor): According to table 1 shows that of 41 elderly people with gout arthritis almost half (46%) of moderate psychomotor behavior. This is demonstrated by the recapitulation of the data from the psychomotor questionnaire of positive statements (perception and readiness) of number 2, 3, (guided movements and accustomed movements) number 4, (complex movements) number 7, (Adjustment of movement patterns) number 8, and (creativity) Number 11 almost half the elderly patients Gout arthritis replied "Never", according to the statement of researchers supposedly elderly people gout arthritis answered "always". However, from the positive aspects (creativity) Number 10 almost half the elderly people who gout arthritis answered according to the researcher's statement "always". The elderly is a human life cycle that must be experienced by everyone. In fact, at this time, each time the word "elderly" in mind is a person who is helpless, and has many health complaints [6], one of the many elderlies who suffer from the disease gout arthritis. The elderly not only as a person who is repossessed and respected, but also serves as an agent of change in the family environment and the surrounding community in creating a healthy family, by utilizing the experience already possessed and enriched with the provision of appropriate health knowledge. The elderly undergoes a change in the musculoskeletal system which is reduced muscle mass and strength such as the strength of hand grasping and foot strength. The risk factor is reduced muscle strength, flexibility and coordination, the limited range of joint motion, increased risks of falling and fracture, therefore the motion pattern in elderly people with Gout arthritis is very limited and the food consumed is limited (should not consume foods high in Purine). Elderly Gout arthritis sufferers are recommended for regular exercise in accordance with the pattern of motion to train the strength of muscles so as not to experience stiffness and reduce pain in the joints[8,9].

While the negative statements (guided movements and accustomed movements) number 5, (complex movements) number 6, and (adjustment of movement patterns) Number 9 Almost half the elderly people gout arthritis answered "always", should be in accordance with the statement of elderly researchers Gout arthritis replied "never". However, from the negative aspects (perception and readiness) to number 1, and (creativity) number 12 Almost half the elderly Gout arthritis sufferers answered according to the researcher's statement "never". Elderly who are still able to do gymnastics and road moves together, show that a healthy elderly. This signifies that in young times the pattern of life is also certainly healthy. Healthy living should start since young ". exercise is a pattern of motion that must be done routinely by elderly people who are gout arthritis. There is some exercise that can be done by elderly gout arthritis sufferers; Light gymnastics, keep the joints flexible and easy to move to reduce stiffness[12]. Also, warm compress can reduce pain in joints[13]. Yoga, very beneficial for elderly people with gout arthritis can help increase muscle strength and flexibility of the body. Tai-chi, to enhance and maintain muscle strength without the need to use weights. Stretching or stretching, will help the flexibility as well as muscle strength. Regular walking, will get better health, not only burn calories but walking can also strengthen muscles without having to torture joints[12,14].

Conclusion

In this study we revaled that (1) elderly people with Gout arthritis almost half has cognitive behavior in the low category in the Posyandu Rekso Werdho V Wonokromo Surabaya; (2) elderly people who have gout arthritis nearly half have affective behavior in the category of being in the Posyandu Rekso Werdho V Wonokromo Surabaya; and (3) elderly people with Gout arthritis almost half has psychomotor behavior in the category of moderate in the Posyandu Rekso Werdho V Wonokromo Surabaya.

Clinical Study of Functional Outcome of External Fixator Device as a Primary Definitve Treatment of Open Tibia Fracture

Praveen Garg[1], Rajvirsinh Sodha[2], Fahad Bin Hamid[3], T. Somashekarappa[4]

[1]Associate Professor, Department of Orthopaedics, RMCH, Bareilly, U.P., [2]Junior Resident, Department of Orthopaedics, RMCH, Bareilly, U.P., [3]Assistant Professor, Department of Orthopaedics, RMCH, Bareilly, U.P., [4]Professor and Head, Department of Orthopaedics, RMCH, Bareilly, U.P.

Abstract

Background: Open fractures of leg are quite common in Road traffic accidents. The ideal protocol for open fractures of leg is initial thorough debridement, soft tissue coverage and intramedullary nailing or external fixator application. External fixator may be later converted to internal fixation with reamed or unreamed intramedullary nail or left as a definitive treatment.

Methodology: This prospective study was conducted at Rohilkhand Medical College And Hospital from January 2019 to January 2020 on patients presenting with open tibial fracture. Tubular External Fixator was used. Total 30 patients were enrolled in this study.

Results: In our study 30 patients were included in which 20 were male and 10 were females with mean age 32.2 years including children and elderly age group there was no age bar. Mean operative time was 60 minutes. Average time for union was 24 weeks.

Conclusion: External fixation as a primary definitive treatment for open tibial fracture is a cost effective procedure in developing country with minimal morbidity and mortality.

Keywords: *Compound fracture, external fixator, Pin.*

Introduction

Open fractures of leg are quite common in Road traffic accidents. The ideal protocol for open fractures of leg is initial thorough debridement, soft tissue coverage and intramedullary nailing or external fixator application. External fixator may be later converted to internal fixation with reamed or unreamed intramedullary nail or left as a definitive treatment.[1]

The goals of open fracture management are prevention of infection, soft tissue coverage, achievement of bony union and restoration of function. Important principles involve antibiotic utilization, timing of initial surgical intervention, thorough debridement, type of wound closure and fixation of fracture after proper alignment.[2]

The management depends on type of injury, contamination of wound, viability of skin and soft tissues and compartment syndrome. Though intramedullary interlocking nailing is used in open fractures of tibia. In reamed nail the infection rate has been reported high. A high incidence of infection has been reported in delayed intramedullary nailing[3]. There is controversy in literature regarding the best way of management of type II and type III open tibia fractures[4]. Ex fix as a definitive procedure reduces the cost of one more surgery.

Aim and Objectives: To assess the functional outcome of external fixator device as a primary definitive treatment for open tibia fracture.

Materials and Method

The study was done at Rohilkhand Medical College And Hospital from January 2019 to

January 2020.

Total 30 patients were included, and all patients treated with external fixator as definitive treatment after thorough debridement and proper reduction and alignment of fracture.

Inclusion Criteria:

Open fractures of both bones of leg type II, type III A and B (Gustilo Anderson)

Exclusion Criteria:

Fractures with bone defects

Intra-articular fractures.

Surgical technique: The patients with compound fracture injury taken up for surgery on OT table, proper scrubbing of limb and draping done, prophylactic antibiotics was given.

Thorough wound debridement and wound wash with normal saline was done

Proximal and Distal pins applied on arterio-medial aspect of tibia

Anatomical reduction and alignment were done and connecting rods was applied

If the tissue and skin viability is good, a primary closure was done without any tension.

If necessary release incision was given for primary closure of wound.

Wound swab was taken for culture and sensitivity before closure.

Soft tissue coverage by flap or skin grafting was done within two weeks in patients in whom primary closure was not done.

Depending on the culture sensitivity of the organism appropriate antibiotics were continued for ten days.

The pins were cleaned and dressed with beta dine on alternate days.

Follow Up: Each patient was evaluated clinically and radiographically at three weeks, six weeks, 3 months, then after every four week to assess the union of the fracture.

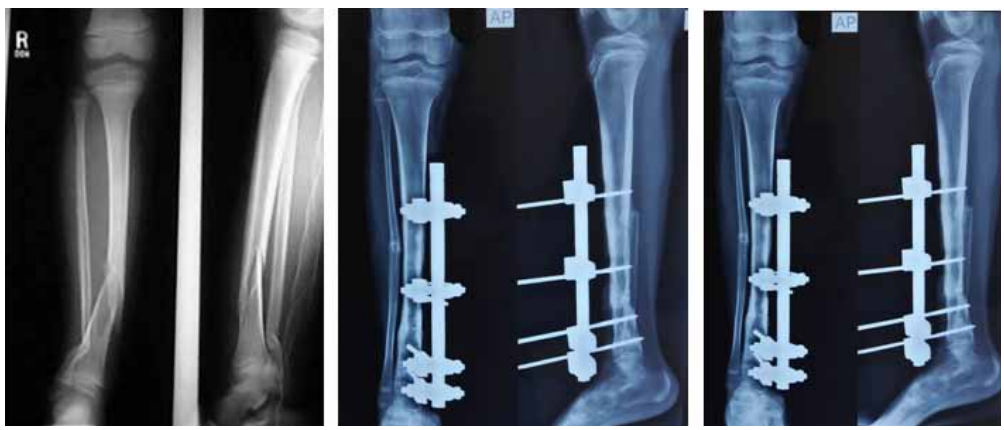
Pin tract infections were treated by dressing, appropriate antibiotics.

Fracture healing was assessed by standard radiographic projections and union defined as dense callus bringing at least three cortices.

Partial weight bearing was allowed at 6 weeks and full weight bearing at around 3 months.

The external fixator was removed when there is union of the fracture. A pop slab was given for two weeks for the healing of pin tracks.

The patients were assessed for healing of soft tissues, fracture union, function of knee and ankle.



(a) (b) (c)

Fig (a) Pre-operative X ray (b) 6 weeks post-operative (c) 12 weeks post-operative

Result

In our study 30 patients were included in which 20 were male and 10 were females with mean age of 32.2 years. Mean operative time was 60 minutes. Average time for union was 24 weeks.

The level of fracture was at middle 1/3 in 22 and lower 1/3 in 5 cases and upper 1/3 in 3 cases. The grade of open fracture was type II in 20, type III A in 6 and type III B in 4 patients.

Primary closure was done in 22 patients while secondary closure was done in 5 patients and flap coverage was done in 3 patients.Complication like loss of reduction occurred in 3 patients, pin tract infection was occurred in 6 patients, pin loosening in 1 patient.

The fracture union by 10-12 weeks in 2 patients, by 12-16 weeks in 6 patients, 16-20 weeks in 14 patients, and 20-24 weeks in 8 patients.

Malunion was defined as varus or valgus malalignment of 5 degree or more, anterior or posterior angulation of 10 degree or more, shortening of 1 cm or more or rotational malalignment of 10 degree or more as compared with the contralateral leg.

In our study there were 3 patients had nonunion and 3 patients had delayed union. Pin tract infection was major complication of the external fixator. In our study 6 patients had pin tract infection. This was managed by pin tract dressing and antibiotics.

No patient had osteomyelitis like complication. There was no restriction of range of motion of knee and ankle joint.

Discussion

Open tibial fractures are associated with infection, soft tissue injury, malunion andnon-union thus leads to greater challenge [4,5,6]. These cases should be managed as early as possible to minimize complications. Intramedullary nailing is not possible due to contaminated wound thus external fixator is method of choice. External fixator has advantages of low blood loss and proper wound care.

1. **Comparison of Mean Age:** Mean age in present study was 32.3 years compared to 25.5 years in Irfan S et al [4] study which suggest older age group involved in present study while in A. Velazco et al [5] it was 40.2 Years.

   Age group 30-50 are productive age group who have high risk of injury.

2. **Gender Comparison:** Male predominance was found in both studies which may be attributed to higher risk of fracture in this population. In present study male population was 20 and female population was 10 as compared to A. Velazco et al[5] and Ravi Kumar et al[6] has more male population.

3. **Comparison of Level of Fracture:** Most common was Middle 1/3rd fracture followed by lower and upper 1/3rdin present study and Ravi Kumar et al [6] as in our study middle fracture was 22 and in Ravi Kumar et al [6] was 26 patients. It may be attributed to mechanics of tibial fracture which suggests middle 1/3 having high risk.[5,6]

4. **Comparison of Fracture Union:**

Table 1: Comparison of Fracture Union:

Weeks	Present Study	Irfan S et al[4]
10-12	2	1
12-16	6	2
16-20	14	10
20-24	8	2
>25	0	5

In most of cases healing was found between 16-20 weeks in both studies. In Irfan S et al study 5 patients took >25 weeks' time to heal.

5. **Comparison of complications:**

Table 2: Comparison of complications

Complications	Present Study	Ravi Kumar et al[6]
Loss of reduction	3	3
Pin tract infection	6	8
Pin loosening	1	1
Delayed Union	3	2
Non-Union	3	3

Pin tract infection was most common complications in both studies which may be due to local site wound contaminations which can be managed with antibiotics and dressing. Loss of reduction occurred in 3 patient which was managed conservatively. Pin loosening was found in 1 patient in each study. Delayed union in 3 patients in present study while Ravi Kumar et al reported 2 patients. There were non-union in 3 patients in present study while Ravi Kumar et al reported 3 patients.

Conclusion

External fixation as a primary definitive treatment for open tibial fracture is a cost effective procedure in developing country with minimal morbidity and mortality.

To Study Preloading and Relative Efficacy of Ringer's Lactate and Pentastarch 6% Prior to Spinal Anaesthesia in Lower Abdominal and Lower Limb Surgeries

Priya Kishnani[1], Ishaan Batra[2], Tejash Sharma[3], Malini Mehta[4]

[1]Assistant Professor, Department of Anaesthesiology, Dhiraj Hospital, Smt. B.K. Shah Medical Institute & Research Centre Sumandeep Vidyapeeth Deemed to be University, Vadodara, Gujarat, [2]Senior Resident, Department of Anaesthesiology, Maulana Azad Medical College, New Delhi, [3]Associate Professor, [4]Professor, Department of Anaesthesiology, Dhiraj Hospital, Smt. B.K. Shah Medical Institute & Research Centre Sumandeep Vidyapeeth Deemed to be University, Vadodara, Gujarat

Abstract

Background and Objectives: Hypotension after spinal anaesthesia remains a common and a serious complication. Various method have been recommended for the prevention and treatment of this problem. Preloading has become the cornerstone for prophylaxis of hypotension post spinal anaesthesia. This current study reassessed the efficacy of this volume preloading and also compared the efficacy between Ringer's lactate and Pentastarch 6%.

Method: In this study, 60 patients (ASA I & II) presenting for elective lower abdominal and lower limb surgeries under spinal anaesthesia were allocated into two groups, group P and group R to receive 5 ml/kg of 6% Pentastarch and 10 ml/kg of Ringer's lactate preload respectively. After institution of spinal anaesthesia in a sitting position with 3.8 ml of Bupivacaine 0.5% (heavy) using 23G Quincke spinal needle, patients were made to assume supine position. The heart rate(HR), systolic blood pressure(SBP) and diastolic blood pressure(DBP) were monitored intra-operatively every 2 minutes for first 10 minutes and every 5 minutes for next one hour and every 15 minutes thereafter. Electrocardiogram (ECG) and oxygen saturation(SpO_2) were monitored continuously. The amount of ephedrine, used intra-operatively were noted and compared among the different groups.

Results: The incidence of hypotension in group R was more than that in group P. There were no significant difference in HR and the SpO_2 between the groups. The difference in mean basal SBP and DBP were statistically insignificant in both groups. Thereafter, the fall in SBP and DBP was more prominent in group R at all time intervals with a statistically highly significant difference between the two groups (p value <0.001). The amount of ephedrine used in group R was more than that used in group P. There were minimal complications like shivering and vomiting which were statistically non–significant . There were no allergic reactions to the fluids used.

Conclusion: Volume preloading, still has a substantial role in reducing the incidence and severity of hypotension in patients operated under spinal anaesthesia. Pentastarch 6% is found to be a better agent for preloading, as it is safe and effective in preventing spinal-induced hypotension in patients.

Introduction

Spinal anaesthesia is most commonly associated with hypotension and bradycardia due to anaesthetised spinal sympathetic nerve fibres.(1) One of the most common method of preventing spinal anaesthesia

induced hypotension is by the "pre-loading" technique described by wollman and marx. Preloading decreases the incidence of hypotension associated with spinal anaesthesia in the first 15 minutes following sub arachnoid injection as compared to patients who did not receive any pre-load.[2,3] It has been suggested that pre-loading with colloids is beneficial in preventing spinal anaesthesia induced hypotension as colloids remains in the intra-vascular space for a longer duration so they resist any decrease in intra- vascular volume following spinal anaesthesia. However prophylactic use of colloids is not routinely done due to increased cost, possible de-arrangement of coagulation and risk of anaphylaxis[4,5].

Crystalloids are fluids that contain mainly water and electrolytes. They are used to provide maintenance of water and electrolytes and expand intravascular fluid. Ringer's lactate is one of the crystalloids that is isotonic with blood, The by- products of the metabolism of Ringer's lactate in the liver counteract acidosis which is a common complication in fluid loss. Colloids are solutions, which, because of their oncotic pressure are confined mainly to the intravascular space. A colloid will usually expand the intravascular space, Pentastarch 6% is a sub group of hydroxyethyl starch sold under the name of pentaspan. Hydoxy ethyl starch is an artificial colloid obtained from starch, it is composed almost entirely of amylo-pectin, which is a highly branched and more stable component of starch.

Aims: To study the effect of preloading and relative efficacy of Ringer's lactate and pentastarch 6% as preloading solution prior to spinal anaesthesia in lower abdominal and lower limb surgeries.

Objectives:

1. To compare the efficacy in terms of haemodynamic response to spinal anaesthesia after administration of Ringer's lactate and Pentastarch 6% as preloading fluid.
2. To compare complication or side effects if any of both the fluids used for preloading.

Methodology

This observational study was undertaken after obtaining approval of the Hospital Ethics committee and written and informed consent from the patients. 60 patients admitted at Dhiraj hospital S.B.K.S M.I and R.C, Piparia, Vadodara, for elective orthopaedics or general surgery cases, meeting the inclusion and exclusion criteria were taken up for this study.

Inclusion Criteria:

- The patients belonging to ASA-I and ASA-II
- Age group from 18 to 60 years.

- Only elective Cases.
- Duration of surgery from 2 to 2 .5 hours.

Exclusion Criteria:

- All contraindications for spinal anaesthesia
- Age less than 18 years or more than 60 years
- Concomitant diseases - diabetes mellitus, hypertension, heart diseases, obesity
- Height less than 150 cms
- ASA III, IV and V.

All patients were examined and a pre –anaesthetic check up was performed a day before the surgery. All investigations were studied and the patients meeting all the inclusion and exclusion criteria were taken for study. All patients had overnight fasting.

After receiving the patient inside the pre-operative room baseline vital signs were recorded using BPL Ultima multiparameter monitor. IV line was secured with 18 gauze cannula. Patients in group R was preloaded with 10ml/kg of Ringer's lactate solution and in group Pwith 5ml/kg of Pentastarch 6% solution respectively over a period of 20 minutes just prior to the administration of spinal anaesthesia. All were premedicated with inj. Glycopyrrolate 0.2 mg and inj. Ondansetron 4 mg i.v.

After 10 minutes of preloading period, subarachnoid block was performed with 3.8 ml of bupivacaine 0.5% (heavy) at L3-L4 or L4-L5 interspace using 23 Gauge Quinke's spinal needle in sitting position. The patient was then positioned supine. Adequate block was obtained and height of block was tested by pinprick method using blunt needle. Hypotension (A decrease in systolic BP by 20% of the baseline value) following spinal anaesthesia was treated with 6 mg bolus dose of ephedrine and additional rapid infusion of Ringer's lactate solution. All patients were administered O_2 4 L/ min by ventimask throughout the period of surgery.

Following observations were made: Electrocardiogram (ECG), heart rate (HR), systolic blood pressure (SBP), diastolic blood pressure (DBP) and oxygen saturation (SpO_2) were monitored every 2 minutes for the first 10 minutes and every 5 minutes till next 1 hour then every 15 minutes till end of surgery.In addition height of the block, and amount of ephedrine used intra-operatively andany allergic reactions to i.v. fluids were noted.

These observations were analyzed to get information on: Degree of hypotension (decrease in the SBP 20% of the baseline value), bradycardia (HR<60 beats/min), requirement of vasopressor, incidence of nausea and vomiting and allergic reactions.

Observation And Results

Figure 1: Level of Sensory Blockade

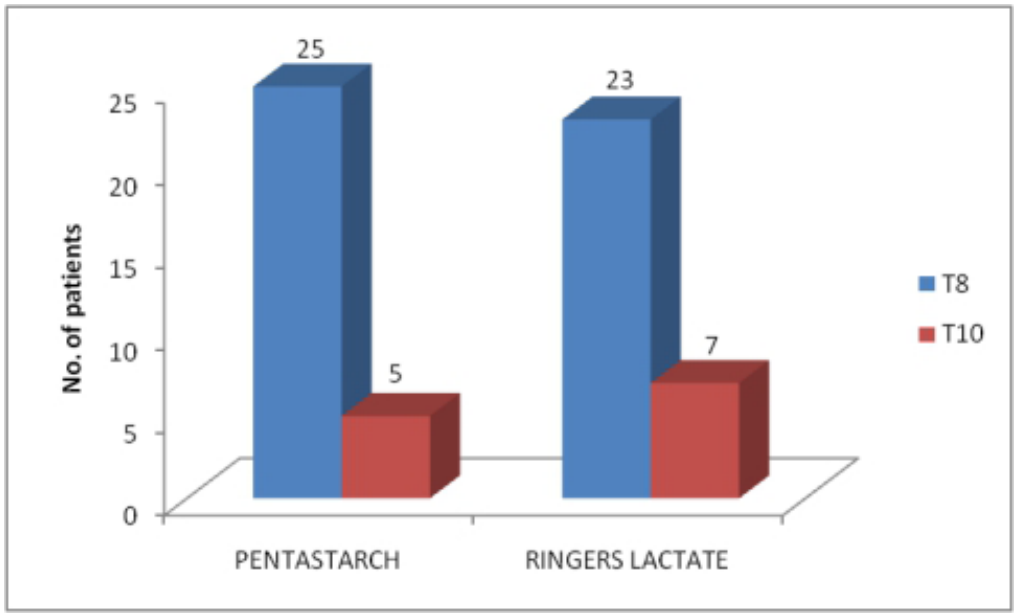

Figure 1: Level of sensory block achieved in both groups

Sensory level was tested by needle - prick method, a sensory level of T8 was achieved in 25 patients in group P and in 23 patients in group R, a sensory level of T10 was achieved in 5 patients in group P and in 7 patients in the group R the difference being statistically non – significant (p value >0.05).

Figure 2: Mean heart rate (bpm) over various time intervals in both the group

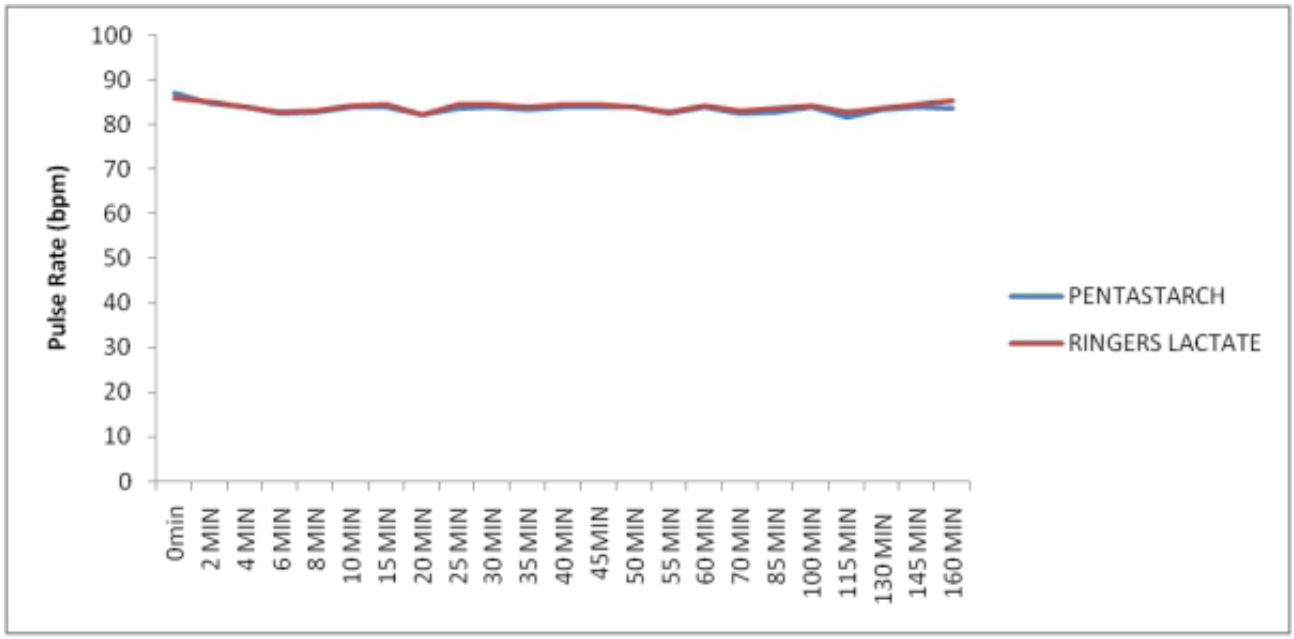

Figure 2: Mean heart rate over various time intervals in both groups

Mean HR variations during the study reveal no statistically significant difference between the two groups with a p value > 0.05 during all time intervals.

Figure 3: Mean systolic blood pressure (mm Hg) over various time intervals in both the groups.

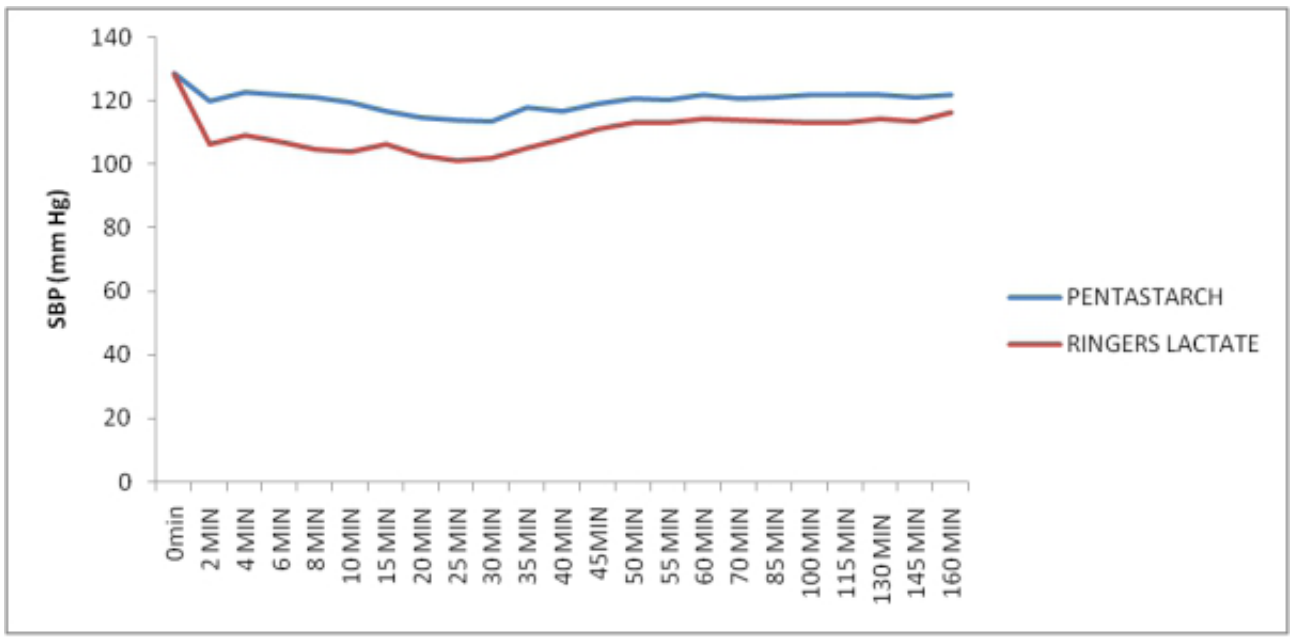

Figure 3: Mean SBP over various time intervals in both groups

The mean basal SBP was 128.73 mm Hg in group P and 128.40 mm Hg in group R, the difference between the two groups being statistically non- significant . Thereafter the fall in SBP was more prominent in group R at all time intervals with a statistically highly significant difference between the two groups as shown in the table. (p value < 0.001). The lowest mean SBP in group R was 101.27 mm Hg at 25 minutes and that in group P was 113.47 mm Hg at 30 minutes, corresponding to a fall in SBP of 21.129 % in group R and a fall of 11.854 % in group P.

Figure 4: Mean diastolic blood pressure (mm Hg)over various time intervals in both the groups.

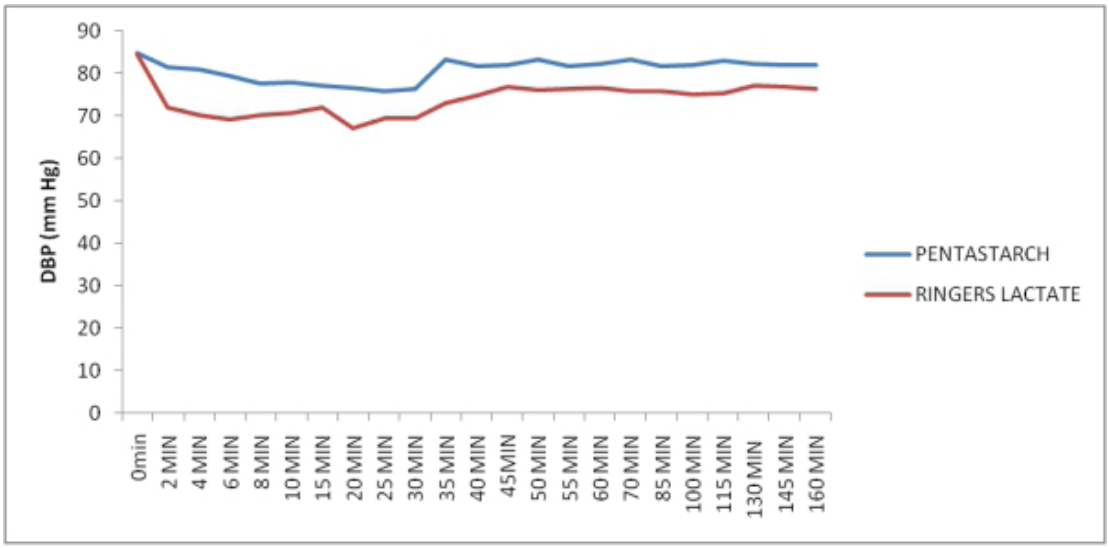

Figure 4: Mean DBP over various time intervals in both groups

The mean basal DBP for group P was 84.73mm Hg and that in group R was 84.47mm Hg the difference being statistically non – significant . Thereafter the fall in DBP was more prominent in group R at all time intervals with a statistically highly significant difference between the two groups as shown in the table.(p value <0.001) The lowest mean DBP was 67mm Hg at 20 minutes in group R and in group P was 75.87mm Hg at 25 minutes, corresponding to a fall in DBP of 20.68% in group R and a fall of 10.45 % in group P.

Figure 5: Mean oxygen saturation (%) over various time intervals in both groups:

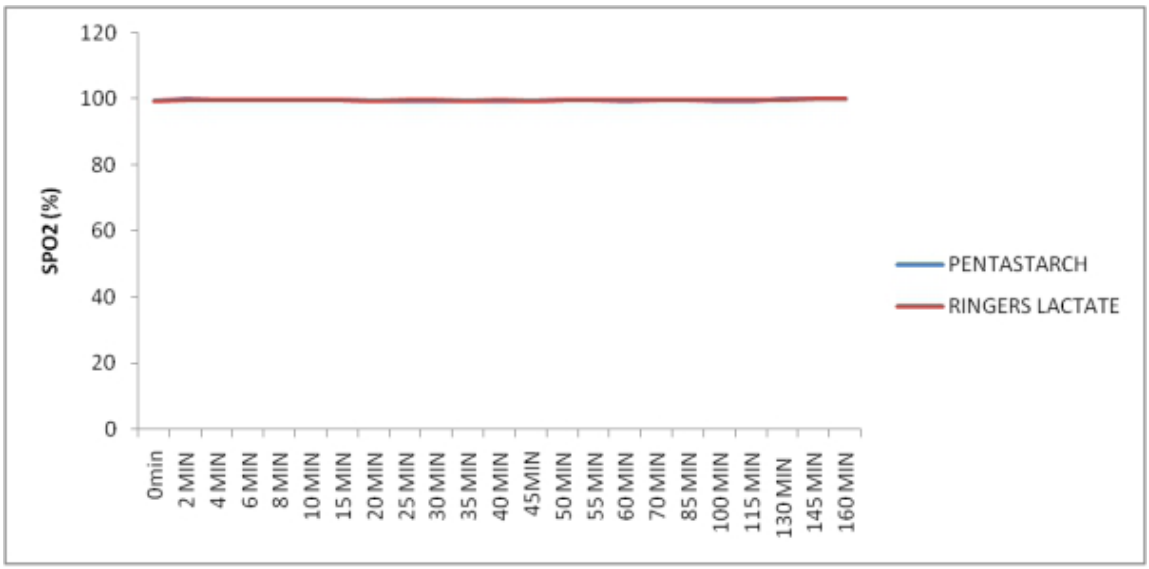

Figure 5: Mean SpO_2 over various time intervals in both groups

Mean SpO_2 variations during the study reveal no statistically significant difference between the two groups with a p value > 0.05 during all times.

Figure 6: Ephedrine Used:

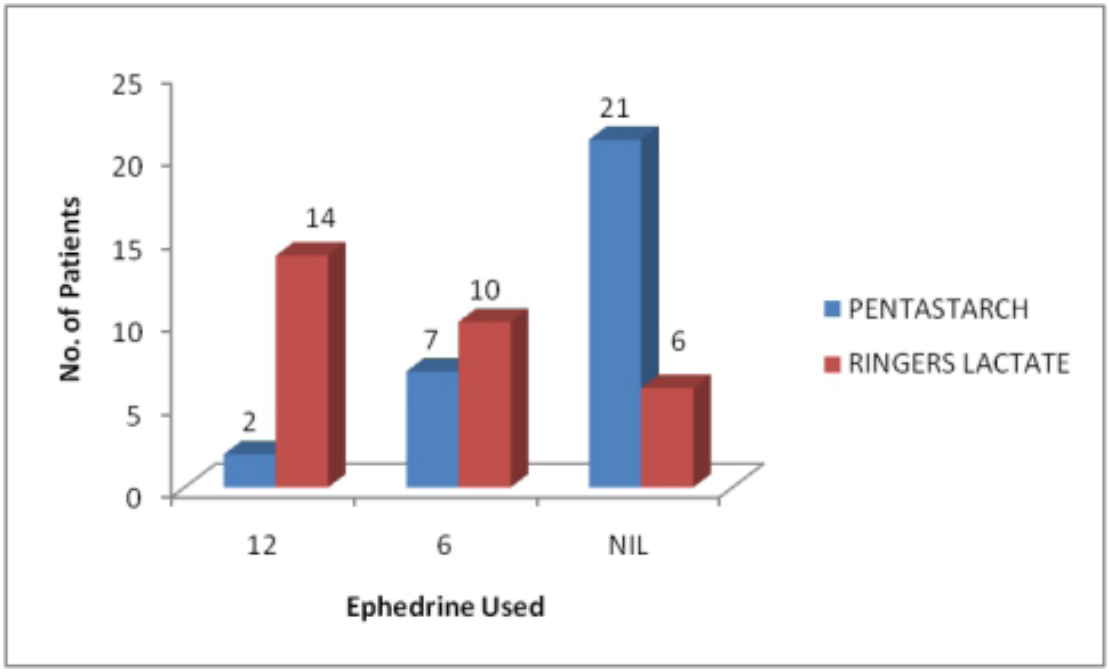

Figure 6: Amount of ephedrine used in both groups

The amount of ephedrine used was more in group R as compared to group P. Ephedrine was not at all required in 21 patients in group P(70%) as compared to 6 patients in group R (20%) the difference being statistically highly significant with a p value< 0.001. The amount of cumulative ephedrine used in group P was 66mg as against a use of 228 mg in group R.

Figure 7: Complications:

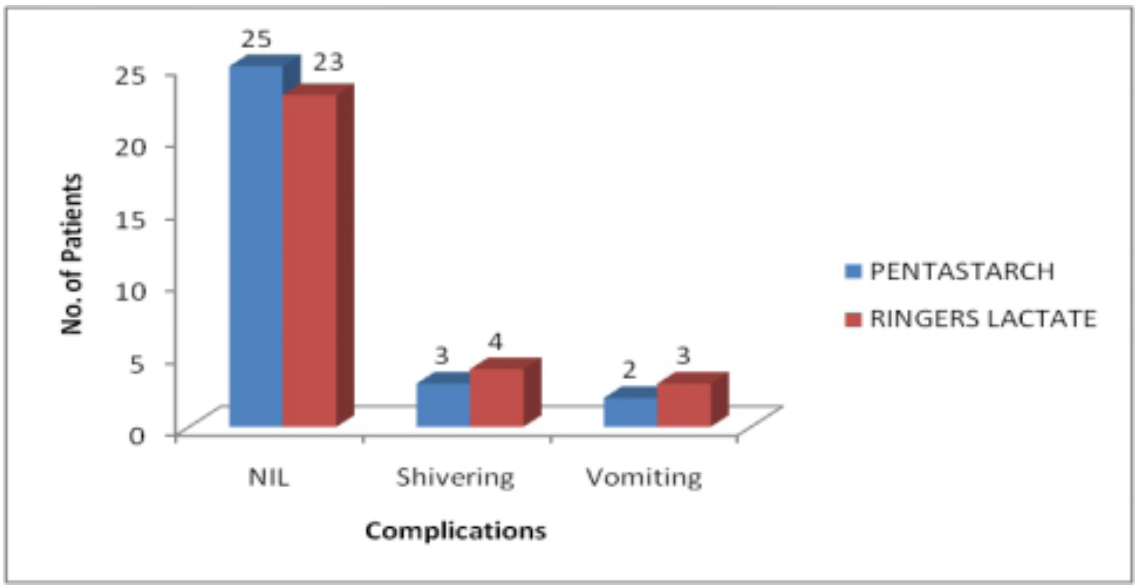

Figure 7. Incidence of complications in both groups

There were similar incidences of shivering and vomiting between the two groups.

Discussion

Hypotension is the commonest problem following spinal anaesthesia for lower abdominal and lower limb surgeries. Blood pressure is usually maintained inspite of vasodilation, by a reflex increase in cardiac output. However, in the presence of spinal anaesthesia induced venodilation, venous return is reduced and so is cardiac output thus causing severe hypotension . Therefore, increase cardiac preload is done before institution of spinal blockade to prevent hypotension. (6)

Rout et al, Jackson et al 1994 recommended 1000 ml of a balanced electrolyte solution for prehydration before regional anaesthesia. Although, preloading with 1000 ml of crystalloid decreases the incidence of hypotension but it still remained a frequent event. Some researchers even increased the volume of crystalloid to 2000 ml, but use of large volumes of crystalloid fluid has risk of haemodilution along with decreased oxygen-carrying capacity, and pulmonary oedema in patients with a reduced pulmonary interstitial safety margin, due to a fall in oncotic pressure and an increase in the plasma volume. (6,7)Since colloids remain in the vascular compartment for a longer time period than the crystalloids, it is said to require only about one-third to one-fourth as much colloid as crystalloid,for an equivalent amount of venous expansion. Colloid solutions are more expensive than crystalloids and, have other disadvantages, including anaphylaxis.(6,7)

Siddik et al, 2000, compared the preloading effect of 500 ml of Heta starch (HES) with 1000 ml of Ringer's lactate in patients undergoing elective caesarean section, they found that the incidence of hypotension was 20% in HES group as against 40% in Ringer's lactate group. (8)

Xie et al, 2014, studied crystalloid and colloid preload for maintenance of cardiac output (CO) in patients undergoing total hip replacement and observed that preload with colloid was more effective than crystalloid in maintaining CO which might improve haemodynamic stability.(9)

Mandal et al, 2016, compared effects of crystalloid and colloid preload on maternal haemodynamics in elective caesarean section under spinal anaesthesia and found out that the fall of blood pressure was higher in Ringer's lactate group than 6% HES group.(10)

In our study, the incidence of hypotension was found to be lower in patients who received 6% Pentastarch solution as compared to those who were preloaded with Ringer's lactate solution. The results of our study correlate well with the other studies conducted to know the effectiveness of crystalloid and colloids in preventing hypotension post spinal anaesthesia.

Colloids contain larger molecules that did not immediately redistribute, through the extracellular fluid compartment. Hence, they did not decrease plasma colloid oncotic pressure (COP) as much as crystalloid solutions and intravascular volume would be better maintained. Colloid solutions, due to their longer presence in the vascular compartments, maintain a stable haemodynamics where as crystalloid solutions, in larger doses, dilute the plasma proteins resulting in a greater extra-vasation of fluid into the extracellular fluid compartment secondary to the fall of plasma colloid oncotic pressure.(11,12)

The amount of vasopressor (Ephedrine 6mg boluses) required to treat hypotension was found to be more in group R as compared to group P.

The other important parameters like the age of the patient, height of the patient, weight of the patient, the dose of local anaesthetic used for the subarachnoid block and the level of sensory blockade obtained,were intentionally kept comparable in all the groups as much as possible, to avoid these factors influencing our study.

There were no significant difference in heart rate and the oxygen saturation (SpO_2) between the groups. The difference in mean basal SBP and DBP were statistically non- significant in both groups. Thereafter, the fall in SBP and DBPwas more prominent in group Rat all time intervals with a statistically highly significant difference than group P.(pvalue <0.001)

Incidence of nausea, vomiting and shivering were comparable in both the groups.

In this present study, Pentastarch 6% did not produced any allergic reactions. Pentastarch is derived from waxy starch and composed chiefly of amylo-pectine. The structural similarity to our body glycogen explained its lower antigenic potential, and there was no evidence that it interferes with the clotting in trauma or major surgery patients.

Conclusion

Pentastarch 6% was better than Ringer's lactate in reducing the incidence of spinal anaesthesia induced

hypotension in lower abdominal and lower limb surgeries with similar incidences of complications like vomiting and shivering.

Human Liver Morphology: Anatomical Study about the External Aspects

Priyanka N. Sharma[1], Nirali Chavda[2], Hetal V. Vaishnani[3], K.M. Parmar[4], Kinjal Jethva[5], Manoj Kulkarni[6], A.R. Gandotra[7]

[1]Assistant Professor, [2]Tutor, [3]Professor, [4]Assosiate Professor, [5]Associate Professor, [6]Professor, [7]Professor & HOD, Department of Anatomy, Smt. B.K. Shah Medical Institute and Research Center Sumandeep Vidyapeeth and Institution Deemed to be University, Pipariya, Vadodara, Gujarat, 391760.

Abstract

Knowledge of the anatomy of liver is a prerequisite for a complete understanding of the mechanics of diagnostic imaging and minimally invasive surgical approaches. So the aim of the study is to carry out the morphological feature of right lobe, left lobe, caudate lobe, quadrate lobe and surfaces of liver. This is retrospective observational study done on 75 human livers irrespective of age and sex in Department of anatomy, Smt. B.K. Shah Medical Institute and Research Center, Vadodara, Gujarat. The livers were studied for morphological variationsuch as accessory fissure, accessory mini lobe, Quadrant lobe with tongue like projection, Pons hepatis connecting left lobe with quadrate lobe, Riedel's lobe present, Narrow and elngated left lobe, Absence of quadrant lobe, Absence of fissure for ligamentum teres, Bilobed caudate lobe and classified according to Netter's classification.Out of 75 embalmed human liver 23 (30.67%) livers were normal and 52 (69.33%) livers shown one or more than one morphological variation of liver. Out of 52 liver found abnormal fissures were in 23 (30.67), pons hepatis in 2 (2.66%), riedel's lobe in 3 (4%), absence of quadrant lobe in 1(1.33%) deep renal impression and corset constriction observed in 15 (20%) specimens of liver, diaphragmatic deep groove were observed in 1 (1.33%) specimen. The presence of knowing extra lobes and fissure lies in the fact that might help to interpretation during imaging of hepatobilliary system and may intern lead to surgical implication in operation theater.

Keywords: *Liver, Accessory fissures, Accessory lobes, Caudate lobe, Quadrate lobe, Pons hepatis, Riedel's lobe, Hepatectomy.*

Introduction

Knowledge of the anatomy of liver is a prerequisite for a complete understanding of the mechanics of diagnostic imaging and minimally invasive surgical approaches. Liver is one of the key organ of body which is responsible for detoxifying the blood coming via portal vein, storing glocose, manufacturing cholesterol and secreting bile for digesion of fat. Liver is invariably involved in alcoholism there by causing cirrosis of liver. Liver exibits various lobes viz right, left caudate and quadrate lobe, also has two fissures viz fissure for ligamentum teres and fissure for ligamentum venosum. It has a porta hepatis for the passage of vessels nerves and exit of hepatic ducts, lympatics[1].

There are wide variety of variation in size and number of lobes. It may exibit accessory lobes. Its important to know these anatomical facts and variations regarding liver as they are of utmost importance to hepatobiliary surgeons. So the aim of the study is to carry out the morphological feature of right lobe, left lobe, caudate lobe, quadrate lobe and surfaces of liver.

Materials and Method

This is retrospective observational study done in Department of anatomy, Smt. B.K. Shah Medical Institute and Research Center, Vadodara, Gujarat. The ethical approval for the study was taken before the study. There are 75 cadevaric livers of unknown age and sex collected from routine dissection of medical undegraduate student during dissection and preserved in 10% formalin solution. Any damage or pathology of livers were excluded from the study. The livers were studied for morphological variation such as Accessory fissure, Mini accessory lobe,Pons hepatis which connecting qudrate lobe with left lobe of liver, Riedel's lobe present, Elongated and narrow left lobe,Absence of quadrate lobe,Absence of fissure for ligamentum teres, Quadrate lobe with tongue like projection, Bilobed caudate lobe on right lobe, left lobe, caudate lobe, quadrate lobe and surfaces of liver and classified according to Netter's classification[2]. Each morphological variation was documented carefully with photograph. All data were recorded and calculated.

Results and Discussion

Out of 75 embalmed human liver 23 (30.67%) livers were normal not showing any variant feature. 52 (69.33%) livers shown one or more than one morphological variation of liver. These data suggest a highincidence of morphological variation in the liver.

Very common the accessory fissure on right lobe seen in 13 (17.33%) specimens (Figure 1A, 3A) and accessory fissure on left lobe in 1 (1.33%). Accessory fissure on caudate lobe observed in 5 (6.66%) specimens (Figure 1B) and access or fissure on quadate lobe in 4(5.33%) specimens (Figure 3A). Mini accessory lobe were present in 4(5.33%) (Figure 2C). Quadrate lobe with tongue like projection were found in 4(5.33%) specimens (Figure 2B, 2D) and Riedel's lobe which was extra lobe on right lobe were present in 3 (4%) specimens(Figure 2A).Pons hepatis which connecting left lobe to quadrate lobe were seen in 2 (2.66%) specimens(Figure 1C). Narrow and elongated left lobe seen in 7 (9.33%) specimens (Figure 3B).

Other variations noted were absence of quadrate lobe in 2 (2.66%) specimen, absence of fissure for ligamentum teres in 2 (2.66%) specimens (Figure 1C, 1D). A complete transverse fissure dividing quadrate lobe in bilobed were present in 2 (2.66%) specimens (Figure 2C). The enlarge papillary process and caudate process found in 2 (2.66%) (Figure 2D) specimens. And alsodone classification of livers were as stated by Netter's into six types. (Figure 3B, 3C)[2].

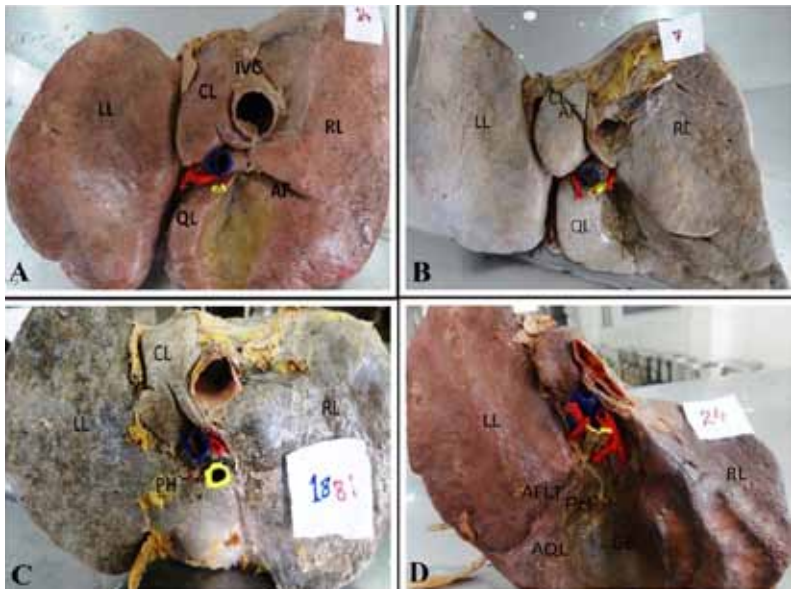

Figure 1 A: Liver showing RL- Right Lobe, LL- Left lobe, QL- Quadrate Lobe, CL- Caudate Lobe, AF- Accessory Fissure on Right lobe, IVC- Inferior Vena Cava, Figure B: Liver showing RL- Right Lobe, LL- Left lobe, QL- Quadrate Lobe, CL- Caudate Lobe, AF- Accessory Fissure on Caudate Lobe, Figure C: Liver showing PH- Pons hepatic connecting left lobe with quadrate lobe, RL- Right Lobe, LL- Left lobe, QL- Quadrate Lobe, CL- Caudate, Figure D: Liver showing AFLT- Absence of Fissure for Ligamentum Teres, AQL- Absence of Quadrate Lobe, GB- Gall Bladber, PH- Pons hepatic connecting left lobe with quadrate lobe, RL- Right Lobe, LL- Left lobe, QL- Quadrate Lobe, CL- Caudate.

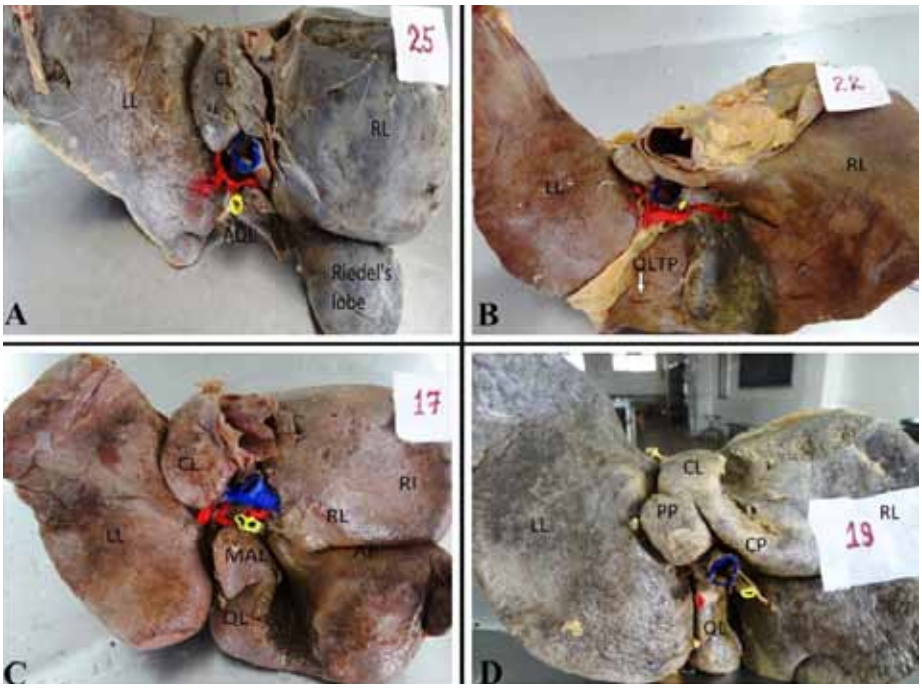

Figure 2 A:Liver showing Riedel's lobe, AQL- Absence of Quadrate Lobe, RL- Right Lobe, LL- Left lobe, QL- Quadrate Lobe, CL- Caudate, Figure B:Liver showing LL- Narrow and Elongated Left lobe, QLTP- Quadrate Lobe with Tongue like Projection, RL- Right Lobe, CL- Caudate, Figure C:Liver showing MAL- Mini Accessory Lobe, AS- Accessory Lobe, RI- Deep Renal Impression LL- Left lobe, RL- Right Lobe, CL- Caudate, Figure D: Liver showing, CL- Caudate, PP- Large Papillary Process, CP- Long Cuadate Process, QL- Quadrate Lobe, LL- Left lobe, RL- Right Lobe.

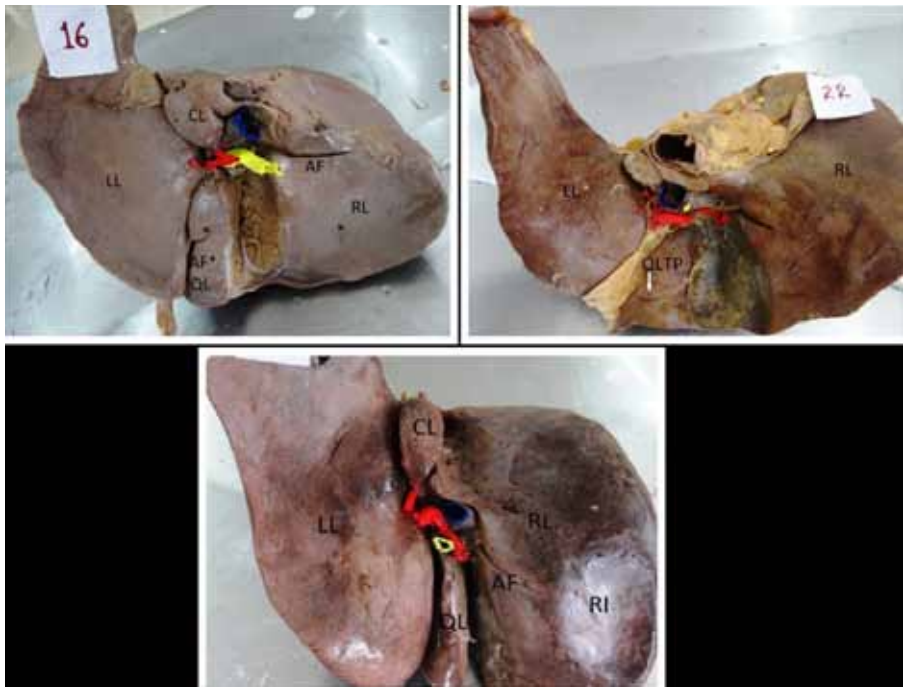

Figure 3 A:Liver showing AF- Accessory Fissure on Right Lobe, AF*- Accessory Fissure on Quadrate Lobe, RL- Right Lobe, CL- Caudate, LL- Narrow and Elongated Left lobe, Figure B: Netter's Type 4 - Liver showing QLTP- Quadrate Lobe with Tongue like Projection, RL- Right Lobe, CL- Caudate, LL- Narrow and Elongated Left lobe,Figure C:Netter's Type 5 - Liver showing CL- Caudate Lobe AS- Accessory Fissure, LL- Left lobe, QL- Quadrate Lobe, RI- Deep Renal Impression, RL- Right Lobe.

Table 1: Different morphological features of liver.

S.No.	Morphological features	Number of specimens	Frequency %
1	Normal	23	30.7
2	Accessory fissures right lobe	13	17.3
3	Accessory fissures on left lobe	1	1.3
4	Accessory fissures on caudate lobe	5	6.7
5	Accessory fissures on quadate lobe	4	5.3
6	Mini accessory lobe	4	5.3
7	Quadrant lobe with tongue like projection	4	5.3
8	Riedel's lobe present	3	4
9	Pons hepatis connecting left lobe with quadrate lobe	2	2.7
10	Elongated and left lobe	7	9.3
11	Absence of quadrant lobe	2	2.7
12	Absence of fissure for ligamentum teres	2	2.7
13	Superior and Inferior quadrate lobe	2	2.7
14	Bilobed caudate lobe	2	2.7
15	Large papillary process of cuadate lobe	1	1.3
16	Long caudate process of cuadate lobe	1	1.3

Table 2: Classification of liver morphology according to Netter[2]

S.No.	Netter type	Number of specimens
1	Type 1 (Very small left lobe, deep costal impressions)	1
2	Type 2 (Complete atrophy of left lobe)	-
3	Type 3 (Transverse saddle like liver, relatively large left lobe)	1
4	Type 4 (Tongue like process of right lobe)	3
5	Type 5 (Very deep renal impression and corset constriction)	15
6	Type 6 (Diaphragmatic grooves)	2

Congenital anomalies of liver confront are lobes does not developed or a segment, lobes may be malform or may be tiny. These anomalies may occur due to abnormal cell lines in the septum transversum in which the liver develops[3]. Most of the times the liver exibits malformation due to any chang in the microenviornment during organogenesis[4] and it need to be research such studies have been carried out by many research workers throughout world and in the country bu no such research work has been carried out in rural Gujarat.

The present study conducted on various lobes of liver. Variations in the fissures were studied by many researchers[5-13]. A study carryout by *Joshi D et al*[6] reported 30% of accessory fissures in their study. Similar another study was conducted by *Patil et al*[14] *and Chadhari et al*[4] revealed 14% and 17.5 % of the livers had accessory fissures. In the present study, the accessory fissures were also present in 30.67% of livers.

Presence of accessory lobes persented on caudate lobe, quadrate lobe and left lobe. It was found to be 5.33% of livers in preent study. The similar finding was seen by *Chaudhari et al*[4], 3.7 %. And Patil et al fonud lower incidence was 2%.

Pons hepatis is connecting left lobe with quadrate lobe. Pons hepatis was seen 2.66% of the liver in the present stydy. The similar finding was observed by *Chaudhari et al*[4] reported in 1.25%. Where in other studies found higher incidence as *Patil et al* reported 10%, Joshi et al[6] reported 30%.Clinically, metastatic

hepatomas have been found originating from the pons hepatis as well as harboring site of peritoneal disseminated tumor cells.

In present study,it was seen absence of fissure for ligamentum teres in 2.66%. The similar finding was seen by *Nayak et al* repoeted 1.81 % and Patil et al observed 4% incidence in liver. Where in other studies found higher incidence as *Chaudhari et al*[4] reported 11.2%, *Muktyaz et al*[9] seen 9.7%.

The prominent papillary process and long caudate process were seen in 1.25% specimen in our study, similar to findings of Nayak et al[11] and chaudhari et al results. When enlarged papillary process or prominent papillary process it is look like body mass of pancrease in cirrosis of liver. Caudate lobe enlargement commonly accompanies occlusion of the hepatic veins; along with patchy areas of low and high attenuation on CT.

Elongated and narrow left lobe found in 9.33% incidence in our study which was similar with that of *Chaudhari et al*[4] observed in 12.5%. Where as it was found low incidence in *Nayak et al*[11], 1.81%.

Table: 3 Comparison between present study and other studies.[4]

Morphological features	Chaudhari et al[4] (%)	Joshi SD et al [6] (%)	Nayak BS [11] (%)	Patil S et al [14] (%)	Sarita et al[15] (%)	Present study (%)
Normal liver	17.5	-	60	56	66	30.7
Accessory Fissures	12.5	30	1.81	10	34	30.7
Accessory Fissures on caudate lobe	3.7	-	-	-	6	6.7
Bilode Quadrate Lobe	7.5	20	-	4	-	2.7
Pons hepatis connecting left lobe with quadrate lobe	1.25	30	-	10	-	2.7
Absence of fissure for ligamentum teres	11.2	-	1.81	4	-	2.7
Riedel's lobe present	1.25	-	-	-	2	5.3
Elongated left lobe present	12.5	-	1.81	-		9.3
Accessory Mini lobe present	3.7%	-	-	2%		5.3
Large papillary process	1.25%	32%	1.81	-	4	1.3

Conclusion

It is emphasized the importance of the liver morphology of the Gujarati population. The findings of our study highlights some of variations in fissure and lobes of the liver. With advances in liver surgical procedures like laparoscopic thermal ablation for patients with hepatic tumour and laparoscopic hepatectomy, these variations presume more importance. The presence of knowing extra lobes and fissure lies in the fact that might help to interpretation during imaging of hepatobilliary system and may intern lead to surgical implication in operation theater.

Acknowledgement: I express my sincere gratitude to the generous donors who donated their bodies for academic and research purposes. Without cadavers this research would have not been possible.

Informed Consent to Patients in Root Canal Treatment (Case Study: Melati Dental Clinic Jakarta, Indonesia)

Pudentiana Rr RE[1], Tedi Purnama[1], Syifa Yulia Lestari[2], Yulianti[3]

[1,2]Assistant Professor, [3]Lecturer, Department of Dental Health, Health Polytechnic of Jakarta I, Indonesia, [4]Dental Nurse, Melati Dental Clinic Jakarta, Indonesia

Abstract

Teeth with necrosis require root canal treatment. Before taking any action, the treatment plan that will be carried out along with the risks must be explained clearly to the patient and his family, and then must get informed consent for the treatment plan. The purpose of this study was to the description of informed consent in patients with root canal treatment at the Melati Dental Clinic in Jakarta. **Method:** This research uses descriptive method with research sample using technique total sampling of 50 respondents. The data used are secondary data taken from the patient's medical record. Results: Respondents 33 people (66%) provided complete informed consent and 17 people (34%) did not give complete informed consent. Respondents doing root canal treatment caused by caries as many as 38 people (76%) and respondent root canal treatment caused not because of caries as many as 12 people (24%). Respondents provided complete informed consent in patients with root canal treatment because of caries by 27 people (71%) and giving complete informed consent not because of caries by 6 people (50%). Whereas giving informed consent was incomplete because of caries as many as 11 people (29%) and incomplete informed consent was not due to caries as many as 6 people (50%). Conclusion: Management of Informed Consent in Root Canal Treatment patients at Melati Dental Clinic in Jakarta has been carried out well.

Introduction

Dental and oral health services are carried out to maintain and improve the degree of public health in the form of improving dental health, dental disease, dental disease treatment and restoration of dental health by the central government, regional governments or the community which are carried out in an integrated, integrated and sustainable manner.[1]

Dental health is an integral part of overall health that can affect quality of life.[2] The most prominent dental health problems in Indonesia a problem of tooth loss due to dental caries. Dental caries is experienced by 90% of Indonesian people.[3]

The results of the Basic Health Research in 2018 reported that 92.2% of Indonesia's population aged 35-44 years experienced dental health problems; a DMF-T index of 6.9 means that the average number of tooth decay is 6 to 7 teeth per person.[4]

Dental caries is a process of demineralizing tooth hard tissue structures such as dentin and enamel. Dental caries or cavities is a dental and oral health problem that is often experienced by almost all people in Indonesia.[5] According to Tarigan (2013) dental caries is a disease of dental tissue characterized by tissue damage, starting from the surface of the teeth extending towards the pulp. Dental caries can be experienced by anyone and can arise on one or more surfaces, and can extend to deeper parts of the teeth, for example from enamel to dentin or to the pulp.[6]

Untreated caries results in disruption of maximal dental function. Tooth decay can be preceded by pulp inflammation and if not treated can continue with pulp death or what is known as pulp necrosis. Teeth with necrosis require root canal treatment, which aims to clear the pulp chamber from infected pulp tissue, then form a root canal for obturation to form an apical seal.[7]

Root canal treatment often requires the removal of enough hard tissue so that it leaves little hard tissue and cannot support the restoration properly because it is easy to crack or fracture. Root canal treatment is done in several visits.[7] Before taking any action, the plan of treatment that will be carried out along with the risks must be explained clearly to the patient and his family, and then must get approval for the action plan.[8]

Informed consent is the consent obtained by the doctor given by the patient or family on the basis of an explanation of the medical action in the form of examination, treatment or any medical action that will be carried out on the patient.[9] Approval of medical treatment can be stated verbally and in writing. Verbal consent where the patient states the patient's consent verbally and does not sign in written form, whereas written consent is needed in the case of broad interventions involving risks where anesthesia or sedation is used as a restorative, invasive or surgical procedure, administration of high risk drugs.[10]

Dentists in providing services to patients need to be vigilant, given the various cases that occur due to carelessness which ultimately lead to legal problems, including due to the incompleteness of one of the means in dentistry services to the public, namely the completeness of medical action approval letters on medical services to patients.[11] Considering the risk of the treatment, in anticipation of a continuing dispute, it is better that the consent given by the patient to the dentist who will treat it be given in writing.[8] Research Herwanda et al (2016) using a questionnaire on young gig doctors at Hospitals Teeth and Mouth Unsyiah, showed that subjects who used informed consent with good criteria were 246 people (95.0%), moderate criteria were 12 people (4.6%), and bad criteria of 1 person (0.4%).[10]

Melati Dental Clinic is a private dental clinic in Central Jakarta that provides general and specialist dentistry services. The 2019 dental clinic report shows that there are three dental diseases with the highest number, namely pulp necrose, dental caries and pulpitis. This shows that root canal treatment is often done as a treatment for pulp necrose.

Based on the above background the authors are interested in conducting research under the title "Informed Consent in Root Canal Treatment patients in Melati Dental Clinic Jakarta"

Method

The research design used is descriptive research, is a method of research conducted with the main objective to make a picture or description of a situation objectively.[12] This study was intended to look at the description of giving informed consent to root canal treatment patients at the Melati Dental Clinic in Jakarta. The population in this study were all medical records Jakarta Melati Dental Clinic patients who performed root canal treatment in January to March 2020 amounting to 50 patients. The sampling technique uses total sampling i.e. the entire population is sampled, so the sample this study as many as 50 patients. This study uses secondary data taken from the medical records of elderly people who have performed dental care in the period of January to March 2020, then recorded using the recapitulation sheet specified by the researchers. This research was processed and analyzed in an excel program and presented in the form of a frequency distribution.

Result

Table 1. Frequency distribution providing informed consent

No.	Complete Informed Consent	Frequency	Percentage (%)
1	Yes	33	66
2	Not	17	34
Total		**50**	**100**

Table 1 to show that respondent 33 people (66%) received complete consent in root canal treatment and 17 people (34%) received incomplete informed consent

Table 2. Frequency distribution causes of root canal treatment

No.	Root canal treatment	Frequency	Percentage (%)
1	Root canal treatment because of caries	38	76
2	Root canal treatment not because of caries	12	24
Total		**50**	**100**

Table 2 shows that respondents treated root canals because of caries by 38 people (76%) and treated root canals not because of caries by 12 people (24%).

Table 3. Frequency distribution of complete informed consent for patients with root canal treatment

Complete Informed Consent	Root canal treatment			
	Because of caries		Not because of caries	
	n	%	n	%
Yes	27	71	6	50
Not	11	29	6	50
Total	**38**	**100**	**12**	**100**

Based on table 3, shows that respondents provided complete informed consent for root canal treatment because of caries by 27 people (71%) while giving complete informed consent for root canal treatment not for caries by 6 people (50%). Respondents provided incomplete informed consent for root canal treatment because of caries by 11 people (29%) while incomplete informed consent for root canal treatment was caused not by caries as many as 6 people (50%).

Discussion

The results of the study gave informed consent obtained by respondents given complete informed consent on root canal treatment as many as 33 people (66%) and incomplete informed consent as many as 17 people (34%). This is in accordance with research Herwanda et al (2016)showed that research subjects using informed consent were 95.0%. So it can be interpreted that previous studies have compliance giving informed consent that is better than the results of research conducted by researchers. This causes the doctor to not comply in giving informed consent because doctors' knowledge about the legal consequences of informed consent is also lacking. Lack of doctor's knowledge regarding the legal consequences of informed consent can lead to a lack of physician compliance in carrying out informed consent to patients.[13] Strengthened statement Oktarina (2010), every medical action requires informed consent.[9]

Based on the explanation of the Regulation of the Minister of Health of the Republic of Indonesia No. 290/ MENKES/PER/III/2008 in Elisa et al 2016, informed consent is a one-sided statement of a patient or the legal one representing it in the form of approval of a medical or dental action plan submitted by a doctor or dentist, after receiving sufficient information to be able to making approval or rejection.[14] In this case, the doctor who is obliged to provide information is the doctor who knows the patient's condition and matters relating to the medical actions to be taken, including the dentist at the Melati Dental Clinic in performing root canal treatment.

Root canal treatment often requires a large amount of hard tissue removal that leaves little hard tissue and cannot support the restoration properly because it is easy to crack or fracture so that it can be done with several visits.[7] Also reinforced statements Budi (2013) to anticipate the occurrence of ongoing disputes, the consent of the patient to the dentist who will treat him should be given in writing.[8]

Results research overview of root canal treatment obtained by respondents 38 people (76%) did root canal treatment because of caries and 12 people (24%) did root canal treatment. This study shows the greater treatment of root canals caused by caries. This is in accordance with research Setyaningsih (2015) that indicated that the treatment of root canal treatment of patients in Hospitals Teeth and Mouth UNEJ was 36% and the main cause was caries.[15] Untreated caries results in disruption of maximal dental function. Tooth decay can be preceded by pulp inflammation and if not treated can continue with pulp death/necrosis. Teeth with necrosis require root canal treatment. Besides the causes of root canal treatment is not due to caries which is caused by other causes for example: trauma, chronic tooth abrasion and chronic periodontitis so that retroinfection occurs.[7]

The results showed that giving informed consent to root canal treatment patients because caries had been done well, although informed consent was still found. That is due to several things that occur including, there is no policy at Melati Dental Clinic in Jakarta in the use of informed consent so that the standard operating procedures for dentists and dental nurses give informed

consent to patients before root canal treatment is not carried out properly, especially if the patient's condition so much that doctors and dental nurses forget to give informed consent. In addition there are usually also a number of patient requests that want to be done quickly because their teeth are sick and some who want to hurry home so that informed consent is incomplete.

Conclusion

Management informed consent on root canal treatment patients at the Melati Dental Clinic in Jakarta has been implemented well.

Assess Knowledge and Attitudes on First-Aid Measures for Selected Domestic Accidents among Caretakers of Under-Five Children

Pushplata Manta[1], Kanu Mahajan[2], Kanika Guleria[3]

[1]Nursing Tutor, [2]Nursing Tutor, [3]Assistant Professor, Chitkara School of Health Sciences, Chitkara University Punjab

Abstract

Background: Mishaps are one of the fifth driving reasons for death in industrialized and creating nations. Wounds emerging from mishaps are an expanding general medical issue. Mishaps are a noteworthy reason for dreariness and mortality in kids.

Objectives: The present study was undertaken to find out the knowledge level of women regarding domestic accidents among children.

Method: A descriptive comparative research design was used for the present study. A study sample of 100 care takers of under- five children (50 residing in rural area and 50 residing in urban area) were selected with help of purposive sampling method. Structured questionnaire was used to assess the knowledge and Likert scale was used to find out the attitude regarding first aid measures regarding selected domestic accidents among under five children.

Results: In rural area maximum numbers of care takers had average knowledge regarding domestic accidents i.e. 74%, 22% had good knowledge and 4% had below average. Where as in urban area maximum numbers of care takers had average knowledge regarding domestic accidents i.e. 62%, 33% had good knowledge and 8% had below average. In rural area maximum numbers of care takers had undecided attitude regarding domestic accidents i.e. 64%, 36% had strongly disagree attitude and 0% had strongly agree attitude regarding statements. Where as in urban area maximum numbers of care takers had undecided attitude regarding domestic accidents i.e. 78%, 20% had strongly disagree attitude and 2% had strongly agree attitude regarding statements.

Conclusion: The study findings concluded that majority of care takers have average knowledge and undecided attitude towards domestic accidents of under five children. So, the researcher provides the information booklet to enhance and improve knowledge and attitude of care takers towards domestic accidents.

Introduction

In this day and age, in the created just as the creating nations, risk wins on the streets, yet it likewise exists in the home and play areas. Consistently, a large number of kids pass on or for all time incapacitated because of inadvertent wounds. In many creating nations, wounds are one of the real reasons for death in youngsters in the age gathering of 1-5 years. Childrenbrea the life into scent and significance, they are an endowment of god and we are the planters to address their issues, we give the best to them by appropriate consideration, sustenance, love, consideration and great wellbeing.(1) It is evaluated that number of passing from residential accidents and injuries in 2005 would extend from 730,000 to 985,000 with projections that passing from wounds will increment by as much as 25% throughout the following decade.(2) The damage mortality gauges for the year 2002 recommend that about 9% of all passing in India,

were represented by all wounds share like the worldwide portion of passing because of wounds. Accessible proof from India likewise demonstrates that a great part of the mortality from wounds because of mishaps, murder more kids.

Material and Method: Quantative research approach with descriptive comparative research design was adopted to accomplish the objective of the study that is to estimate the knowledge and attitude level on first-aid measures regarding selected domestic accidents among caretakers of under-five children in selected rural and urban areas of District Fatehgarh Sahib, Punjab.

Ethical clearance was obtained from ethical committee of Desh Bhagat University, Mandi Gobindgarh to conduct the study. Written permission had been taken from Municipal committee of Amloh Shansi Mohalla (Urban Area) and Jalalpur and Baronga Buland of (rural area). Confidentiality and anonymity of the study subjects was maintained.

Permission letter was taken from Director of DBUSON and Sarpanch Baronga and Jalalpur of (rural area) and Municipal committee of Amloh (urban area). The study was conducted on a sample of 100 care takers who were selected by using Non-probability purposive sampling technique, out of which 50 care takers were selected from rural area and 50 care takers were selected from urban area of district Fatehgarh Sahib. The demographic Performa sheet was filled by care takers. A self-structured questionnaire was administered to sample to assess their knowledge level regarding domestic accidents of under- five children. Likert scale performa was administer to assess the attitude of care takers regarding domestic accidents.

Results

A total 100 samples were interviewed in this study. The knowledge regarding domestic accidents in family were In rural area. maximum Education of care takers(54%) was primary education followed by (42%) was matric and (4%) was secondary education whereas in urban area education of care takers (58%) was primary education, (34%) was matric followed by (4%) was secondary and (4%) was graduate and above. According to family income of the maximum care takers in rural area (66%) had family income below 10,000 followed by (30%) had family income Rs 10000-20000, (4%) had more than and equal to Rs 30,000, whereas the maximum family income of care takers of under five children in urban area (34%) had family income between 20,000-30,000 followed by (26%) had family income below equal to Rs 10000, (22%) had more than and equal to Rs 30,000 and above followed by the (18%) had Rs 10000-20000. . Maximum care takers of under five children in rural area (46%) had gained information from media followed by (30%) had gained information from relatives, (24%) had gained information from health personals, whereas in urban area (78%) had gained information from media and followed by (10%) had gained information from any other source, (8%) had gained information from mass relatives (4%) from health personals. According to type of accident maximum in rural area had not met any type of accident (82%) (18%) have met type of accident. Where as in urban area (20%) had accident followed by (80%) do not have any accident.

Table 1: Criterion Measure of knowledge Score among care takers residing in Rural Area and Urban Area N = 100 n_r = 50 n_u = 50

Level of knowledge	Rural Area		Urban Area	
	(f)	(%)	(f)	(%)
Good (21-30)	11	22	15	30
Average (11-20)	37	74	31	62
Below Average (0-10)	02	04	04	08

Maximum Knowledge score: 1
Minimum Knowledge score: 0

Table 1 depicted the level of knowledge score among care takers residing in Rural area(22%) had good level of knowledge followed by (74%) had average level of knowledge, followed by (04%) had below average knowledge whereas in urban area (30%) had good level of knowledge followed by (62%) had average level of knowledge and (08%) had below average level of knowledge

Hence it was concluded that the majority of care takers had average knowledge score on first aid measures regarding domestic accidents among rural area and urban area

Table 2: Criterion Measure of attitude Score of care takers of Rural Area and Urban Area Children
N = 100 n_r = 50 n_u = 50

Level of Attitude	Rural area		Urban area	
	(f)	(%)	(f)	(%)
Strongly agree (38-48)	00	00	01	02
Undecided (27-37)	32	64	39	78
Strongly disagree (16-26)	18	36	10	20

Maximum score: 3
Minimum score: 1

Table 2 depicted the frequency and percentage distribution of level of attitude among caretakers residing in Rural and Urban area. It shows that care takers of rural area(00%) had strongly agree about the statements followed by (64%) had undecided about the statements, followed by (36%) had strongly disagree about the statements whereas care takers of urban area (02%) had strongly agree about the statements followed by (78%) had undecided about the statements and (20%) had strongly disagree attitude towards first aid management for selected domestic accidents.

Hence it was concluded that the majority of care takers had undecided statements on first aid measures regarding domestic accidents among rural area and urban area.

Discussion

The aim of study was to compare knowledge level and attitude level on first-aid measures for selected domestic accidents among caretakers of under-five children residing in selected rural and urban areas of District Fatehgarh Sahib, Punjab with a view to develop and distribute an information booklet.

The present study shows that care takers of Rural area(22%) had good level of knowledge followed by (74%) had average level of knowledge, followed by (04%) had below average knowledge whereas in urban area (30%) had good level of knowledge followed by (62%) had average level of knowledge and (08%) had below average level of knowledge . These findings are consistent with the findings of **Thein MM, Lee BW, Bun PY.** who conducted a study to assess the knowledge level, attitude level and practices of childhood injuries and their prevention by primary caregivers in Singapore. The study result revealed that primary caregivers had poor knowledge on home accidents and first aid.[5]

It shows that care takers of rural area(00%) had strongly agree about the statements and(64%) had undecided about the statements, followed by (36%) had strongly disagree about the statements regarding domestic accidents whereas care takers of urban area(02%) had strongly agree about the statements followed by (78%) had undecided about the statements and (20%) had strongly disagree attitude towards first aid management for selected domestic accidents.

The present study compares the knowledge on first aid measures regarding selected domestic accidents among caretaker of under five children in rural and urban areas. It showed the mean, standard deviation and‘t’ value of knowledge score of care takers regarding selected domestic accidents. The data showed that the mean knowledge score and standard deviation of urban area care takers (18.0±4.20) was higher than the mean knowledge score of the rural care takers (17.4±3.51). The calculated ‘t’ value of 0.77 was found as statistically non -significant.

This study compared the attitude on first aid measures regarding selected domestic accidents among caretakers of under five children in rural and urban areas. The findingsof study showed the mean, standard deviation and‘t’ value of attitude score of care takers regarding selected domestic accidents. The data showed that the mean knowledge score and standard deviation was higher in urban area (29.3±3.72) as compared to rural care takers (28.0±3.37). The calculated‘t’ value of 1.80 was found statistically non-significant.

In present study the association between knowledge score of caretakers regarding first aid measures on selected domestic accidents with their demographic variables was seen. The findings of the study showed that there was no significant association of knowledge score with selected demographic variable ($p \leq 0.05$). i.e.gender, religion, type of family, relation with child, Educational status, Family monthly income, source of information, any type of accident, with knowledge of care takers regarding selected domestic accidents among under -five children in selected area of Distt. Fatehgarh Sahib.

The study find the association between attitudes score on first aid measures regarding selected domestic accidents with their demographic variables. The findings of the study showed that there was not any significant association of following demographic variables age,

gender, religion, type of family, relation with child, Educational status, Family monthly income, source of information, any type of accident,with attitude of care takers regarding selected domestic accidents among under -five children in selected area of Distt. Fatehgarh Sahib.

Conclusion

The finding of this study indicates the need of giving more focus on knowledge regarding domestic accidents in rural areas and creating awareness regarding these accidents through information booklets and health education programmes in the community. Although the knowledge score was good in urban area it also needs to improve the knowledge regarding these types of domestic accidents. The above measure will help to reduce these types of domestic accidents among under five children.

Anthropometric Assessment of Canthal Distances and Canthal Index of South Indian Region: A Cross-Sectional Study

Radha K.[1], Srinivasan K.R.[2]

[1]*Professor, Dept. of Anatomy, Vinayaka Missions Medical College, Karaikal, Puducherry, India-609 609,*
[2]*Professor Emeritus, Aarupadai Veedu Medical College, Pondicherry, India-607402*

Abstract

Background: Orbitofacial anthropometric measurements can be used in identification of gender and ethnicity in forensic anthropology. It also plays a crucial role used in plastic surgery and for identifying genetic syndromes. Canthus is the term employed to explain the either corner of the eyes. Inner canthus is also called as medial or nasal canthus. Outer canthus, is otherwise called as lateral or temporal canthus. Normal canthal values can function as a guide for the diagnosis of pathology and interventions for craniofacial abnormalities. Thus, it is necessary to have a knowledge about the local data of those parameters since this standard reflects the doubtless different pattern of craniofacial growth resulting from racial, ethnic, sexual and dietary differences. Hence this study is undertaken to find out the normative inner canthal and outercanthal distance measurement in population of South Indian region.

Aims and Objectives: The present study was done to find out the normal inner and outercanthal distance and also canthal index of population of South Indian ethnic origin and also to analyse the sexual dimorphism in them.

Materials and Method: This descriptive cross-sectional study was conducted on 200 volunteers of age group 18-25 years of both sexes belonging to South Indian region. Innercanthal distance(ICD) and Outer canthal distance(OCD) were measured using digital vernier caliper.Canthal index was calculated. All the data were analysed using SPSS 16.0 version software and correlated with gender.

Results: Mean innercanthal distance was found to be 2.64 ±0.51 cm in males and 2.51 ±0.46 cm in females respectively in the present study. There is significant sexual dimorphism in ICD . The study also showed outercanthal distance to be 10.35± 0.81cm in males and 10.19 ±1.02 cm in females respectively. Canthal index was 25.71 ±4.91 in males and 24.83±7.83 in females. There is no significant sexual dimorphism in OCD and Canthal index.

Conclusion: It was observed that all the values were significantly higher in males than females of south Indian ethnic origin. And there is a significant sexual dimorphism in inner intercanthal distance.

Keywords: *Innercanthal distance, outercanthal distance, orbitofacial anthropometry.*

Introduction

The face is the most appealing and attractive structure in the human body. Orbit, the anatomical entity in the face plays a vital role in determining the facial attractiveness. It also influences the visual judgement of healthy person as well as those with facial deformities[1]. Anthropometry which is the branch of anthropology measures human physical dimensions[2]. Measurements of soft tissue using a anthropometric instrument is considered as a direct quantitative method to assess physical dimension and the method are non-invasive and easy to perform[3].

Orbitofacial anthropometry has a key role in assessing dysmorphic syndromes, hypertelorism, facial trauma especially naso-orbitoethmoid injury and alsoin diagnosing neural crest anomalies. It also aids in planning reconstructive surgical procedures of face and getting fruitful outcome.

Canthus is the term used to describe the either

corner of eyes. Inner canthus (medial or nasal canthus) is formed by the medial part of superior and inferior eyelids whereas outer canthus (lateral or temporal canthus)) is formed by the lateral part of superior and inferior eyelids[2]. Inner intercanthal distance (ICD) is the distance between medial canthi of eyes and Outer canthal distance (OCD) is the distance between lateral canthi of eyes[4].

Canthal measurements become stable once it has reached the adult level most probably in the mid to late twenties[5]. Canthal measurements are influenced by age,sex,race and ethnicity.

Normal values of canthal distance helps and serves as a guide to diagnose the pathologies and for early surgical intervention. Knowledge of subtle morphological changes in Dysmorphic syndromes which were diagnosed based on molecular and cytogenetic techniques will help in directing towards the useful diagnostic test[6].

Knowledge of variation in the morphological and anatomical relationships of periorbital structures among different ethnic groups helps the surgeons to retain the ethnical features and to derive an ideal outcome in the reconstructive and cosmetic surgeries. Hence this study is under taken to find out the normative inner inter-canthal and outer-intercanthal distance measurement of people of south Indian ethnic origin.

Materials and Method

Present study was done with 200 volunteers of south Indian ethnic origin (Males and Females) of age group 19-25 years. Prior to the initiation of study process, approval was obtained from Institutional Ethical Committe, Vinayaka Missions Medical College, Karaikal. Informed,written consent was got from each participant after explaining the study clearly. Those having orbitofacial deformity, facial trauma,any congenital anomalies involving orbitofacial region were excluded from the study.

All the measurements were taken using digital vernier caliper with the subjects sitting straight with eyes closed and in a relaxed state. Intercanthal distance (ICD) was measured from medial canthus of one eye to medial canthus of the other eye. Outercanthal distance (OCD) was taken from lateral canthus of one eye to the lateral canthus of other eye. All measurements were taken in centimetre. Each measurement was taken twice to avoid error and all the measurements were tabulated in a log book.

Canthal index was calculated using the formula

Intercanthal distance/Outercanthal distance ×100

All measurements were analysed using SPSS software 16.0 version. Descriptive variables were depicted as mean and standard deviation. The mean values of the measurements were compared between either sexes using the independent t test.

Results

The study was done on 90 males and 110 females of age group 18-25 years showed the mean value of innercanthal distance as 2.55±0.51cm, the mean value of outercanthal distance as 10.26±0.92 cm and mean canthal index was 25.23±6.71.(Table 1).

Table I: Descriptive statistics for ICD, OCD, CANTHAL Index

Variable	N	Range	Mean±SD
ICD	200	0.90-4.31	2.55±0.51
OCD	200	3.38-12.65	10.26±0.92
Canthal Index	200	8.31-81.07	25.23±6.71

Table II: Gender with variables Mean±sd comparison using independent sample t test

Variable	Male		Female		t	p value
	N(%)	Mean±SD	N(%)	Mean±SD		
ICD	90(45%)	2.64±0.51	110(55%)	2.51±0.46	2.689	0.008
OCD	90(45%)	10.35±0.81	110(55%)	10.19±1.02	1.195	0.234
CANTHAL Index	90(45%)	25.71±4.91	110(55%)	24.83±7.83	0.935	0.351

Table II shows the mean value of ICD, OCD and CANTHAL INDEX among males and females. All values are higher in males than females. And there is a significant sexual dimorphism in ICD.

Table III: Mean values of ICD,OCD And Canthal index of various regions of South India

State	N	ICD	OCD	Canthal Index
Tamilnadu	132	2.46±0.48	10.21±1.02	24.7±7.65
Kerala	42	2.68±0.39	10.24±0.61	26.2± 3.84
Andhrapradesh	5	2.86±0.50	11.4±0.22	25.15±4.69
Karnataka	21	2.72±0.47	10.35±0.69	26.33±4.44

The ANOVA test had shown that the ICD and OCD significantly varied between regions with (p value -0.006 for ICD and 0.039 for OCD) (Table IV).

Table IV: Showing values for ICD,OCD AND Canthal index between states

Variable	F	P value
ICD	4.336	0.006
OCD	2.845	0.039
Canthal Index	0.760	0.518

Discussion

The dimensions of face and proportions of its components vary in different ethnic groups[7]. Ethnicity of South Indian population belongs to Dravidian ethnic group. Dravidians are one of the non-Aryan races of Southeast Asia and are distributed mainly in South India and Ceylon[8]. Intercanthal distance is influenced by the shape of face,race and gender[9].Inner intercanthal distance serves as a guide to estimate width of maxillary central incisors,which is a determinant of facial aesthetics[10].

LeTT et al reported that facial profile can vary in different ethnic groups and that the dominant characteristics of the Asian faces were a wider ICD in relation to shorter palpebral fissures compared to Caucasians[11]. Normal values of inner and outer canthal distances,canthal index serves as useful parameters in the evaluation and treatment of congenital or post traumatic deformities of the cephalic and facial regions such as telecanthus, occular hypotelorism and craniosynostosis.

Laestadiusreported that in 78% of adults, the ICD is attained by the age of 1 year, after which the growth in this area is slow in contrast to outer orbital dimension[12]. According to Epker and Fish, these values are established by 6–8 years of age and do not change significantly after this time. This stable landmark can be identified, located and measured accurately[13].

Vasanthakumar et al did their study in Malaysian South Indian ethnic adults and found that the outercanthal distance was 97.15 mm in males and 91.78 mm in females which was lower than present study. And they also noted intercanthal distance and canthal index to be 34.1 mm and 35.22 in males; and 32.77 mm and 35.86 in females respectively. These values are very high compared to the values of present study. They have observed sexual dimorphism in all parameters whereas in the present study there is significant sexual dimorphism in intercanthal distance only[14].

The values of inner intercanthal distance found in present study was lower than the normative value found by Farkas et al for Indian population. At the sametime, the outercanthal distance was higher than that given by Farkas et al[15]. Our study showed the lower innercanthal distance and higher outercanthal distance than that found by Singh J.R. et al[16], Agarwal J[17] for Indian population but our study coincides with the findings of Gupta et al[18]. The present study showed mean inner intercanthal distance as 2.55±0.51 cm which is low compared to that reported by Harinee[19] in her study on Kanyakumari population (Part of Tamilnadu, South India) which is 3.275±0.254 cm whereas mean outer canthal distance coincides with her study value.

CONCLUSION

The present study which is done on 200 participants of age 18-25 years showed low value for inner intercanthal distance and high outercanthal distance for South Indian population than Indian population as such. This data values will serve as important aiding tool in recostructive cosmetic surgeries,for diagnosing dysmorphic syndrome by genetic counsellors and for identifying dead or live person by forensic experts.

Tuberculosis of the Breast: A Challenging Component of Benign Breast Diseases

Rajbangshi M.C.[1], Deka Sumi[2], Mahanta Bandana[3], Mahanta Putul[4]

[1]Associate Professor, Department of Surgery, Gauhati Medical College and Hospital, Guwahati, Assam, India, [2]Demonstrator of Biochemistry, Gauhati Medical College and Hospital, Guwahati, Assam, India, [3]Associate Professor, Department of Anaesthesiology, Tezpur Medical College and Hospital, Tezpur, Assam, India, [4]Professor, Forensic Medicine and Toxicology

Abstract

Introduction: Tuberculosis (TB) of the breast is a rare manifestation of extra-pulmonary localization of the disease. The incidences vary from a minimum in developed countries to a high in developing countries like India and Africa.

Materials and Method: This study was a hospital-based observational study carried out in 75 cases of benign breast disease which were studied with special reference to Tuberculosis of the breast. All patients who were clinically diagnosed as a benign breast lump, above the age of 14-years and among them who were willing to undergo investigations and treatment were included. Ziehl-Neelsen staining was performed in all fine needle aspirates and finally, treatment modality used.

Results: The present study involved 67 cases of benign breast lumps and 8 cases of recurrent breast abscesses. Further, it depicts predominant benign breast lumps which were fibroadenoma in 65.7% fibroadenosis in 23.80%, TB breast in 4.50%, ductal papilloma in 2.90% and phyllodes tumour of the breast in 1.5% of cases.

Conclusion: For the TB of the breast in India, various treatment modalities are available. With timely diagnosis, the morbidity can be minimised with less amount of suffering.

Keywords: *Breast diseases; Ziehl-Neelsen staining, fine needle aspiration cytology (FNAC).*

Introduction

Tuberculosis (TB) of the breast is a rare manifestation of extra-pulmonary localization of the disease which accounts for less than 0.1% of breast conditions in developed countries but reaches 3–4% in regions where the disease presents with high incidence (India, Africa).[1] It appears mostly in women of reproductive age, multi-parous, lactating. It has been scarcely reported to infect male patients, mainly before puberty, as well as women of older age. The most common presentation is that of a tumour in the middle or upper-outer quadrant of the breast, with multifocal involvement being rarely documented. The differential diagnosis includes breast cancer and abscess formation. The first case of breast tuberculosis was recorded by Sir Astley Cooper who described it as "scrofulous swelling of the bosom".[2] Tuberculosis is caused by *Mycobacterium tuberculosis* and affects primarily the lungs. Breast tuberculosis is a rare disease, with an incidence of less than 0.1% of all breast lesions in Western countries and 3–4% in tuberculosis endemic regions, such as India and Africa. It usually affects young lactating multiparous women, although it may also be reported in prepubescent males or elderly women.[2,3] Most commonly, the disease presents as a lump in the central or upper-outer quadrant of the breast, while multiple lumps appear less frequently[4] The clinician may misdiagnose breast tuberculosis with either breast carcinoma or abscess.[4,5] Diagnosis

of breast tuberculosis, therefore, remains a challenge for clinicians and requires a high degree of suspicion. Mammography or ultrasonography are unreliable in distinguishing the breast tuberculosis from carcinoma because of the variable pattern of presentation of such inflammatory lesion. Histopathology plays a pivotal role in the diagnosis. Surgery is reserved only for selected refractory cases.[3]

This paper aims to diagnose tuberculosis of breast and provide appropriate treatment.

Materials and Method

The present study deals with 75 patients of benign breast diseases with special reference to TB of the breast. The data were collected from the six surgical units of Gauhati Medical College and Hospital, Assam, during the period from 1st July 2017 to 30th June 2018. All patients who were clinically diagnosed as a benign breast lump, above the age of 14-years and among them who were willing to undergo investigations and treatment were included. Ziehl-Neelsen staining was performed in all fine-needle aspirates.

Evaluation of the cases was done by a thorough clinical breast examination. The breasts are assessed for nodularity and presence of any dominant mass or thickening. The next step was to palpate the regional lymph nodes. These include the supraclavicular, infraclavicular and axillary nodes. Fine needle aspiration cytology (FNAC) was done (Harris Alum – Haematoxylin, Orange G 6 and EA 36 solutions for staining). Ziehl-Neelsen staining to stain mycobacterium tuberculosis and mycobacterium leprae was performed. Ultrasonography of the benign breast tumours was also performed to locate the smooth contours. Round or oval shapes, with weak internal echoes and well defined anterior and posterior margins. Cysts on ultrasound examination, are always well-circumscribed, with smooth margins and have an echo-free centre irrespective of the sensitivity settings. Diagnostic mammography was performed in case of breast abnormality on clinical examination or screening mammography. Calcifications were assessed by it as micro-calcifications and macro-calcifications, mass or cyst is another important change seen on mammograms (non-cancerous, fluid-filled sacs, fibroadenomas). The biopsy was done in all where mammography shows abnormal results. Before collection of the data ethical approval was taken from the ethics committee.

Results and Observations

The present study diagnosed 67 cases of the benign breast lump and 8 cases of recurrent breast abscess who attended outpatient department as well those who were admitted in the six surgical units of Gauhati Medical College & Hospital, Guwahati during the period of 1st July 2017 to 30th June 2018. The data collected from 67 cases are studied based on etiological and clinical backgrounds, the accuracy of diagnostic investigations and finally treatment modality used. During this study, among the patients with a breast lump, only those cases were evaluated who on examination appeared benign and whose ultrasonographic features and FNAC results were benign have been included. All the cases who underwent surgery operated specimen were sent for histopathology.

Table 1: Incidence of the benign breast lump

Type	No. of Cases	Percentage
Fibroadenoma	44	65.7%
Fibro adenosis	16	23.8%
TB breast	3	4.5%
Duct papilloma	2	2.9%
Phyllodes tumour	1	1.5%
Duct ectasia	1	1.5%

Table 1 depicts among 67 cases presented with a palpable lump, among them 44 (65.7%) were diagnosed to be a fibroadenoma, followed by fibro adenosis (23.8%), TB breast (4.5%), Ductal papilloma (2.9%), duct ectasia and phyllodes (1.5% each).

Bar diagram depicts four cases of tuberculosis of the breast were diagnosed, among those three presented as painful lump while others presented as an abscess. 8 cases of recurrent abscesses were included in this study. Pus was sent for Ziehl-Neelsen staining, Bacterial culture and sensitivity and AFB culture. Although Ziehl-Neelsen staining was negative in all of them, AFB culture identified Mycobacterium Tuberculosis, hence the diagnosis of Tuberculosis of the breast was made.

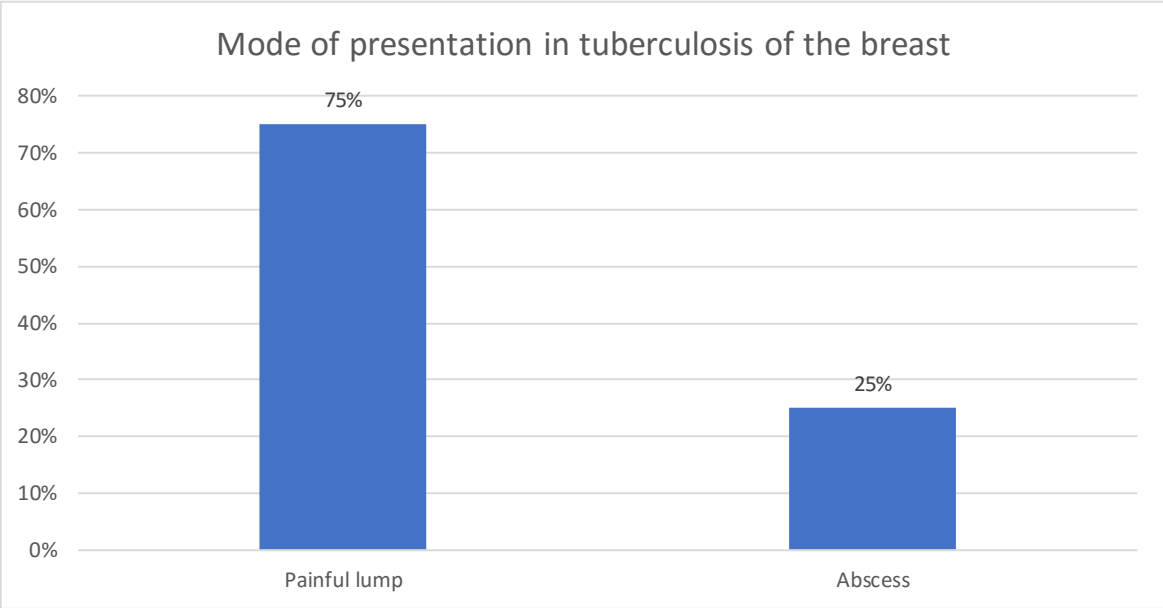

Figure 1 Bar diagram showing modes of presentation in tuberculosis of the breast

Table 2: Significance of Ziehl-Neelsen staining in tubercular mastitis

Ziehl-Neelsen staining	No. of Cases	Percentage
Positive	0	0%
Negative	4	100%

Table 2 depicts Four cases of tubercular mastitis were diagnosed, three of them presented as lumps while one presented as an abscess. All of them stained negative for Ziehl-Neelsen, however, lumps were histopathologically diagnosed as tuberculosis of the breast. While abscess was empirically started on ATT due to recurrent history. One case of fibroadenoma also stained positive for Ziehl-Neelsen, however, it was histopathologically diagnosed postoperatively to be fibroadenoma and was a false positive.

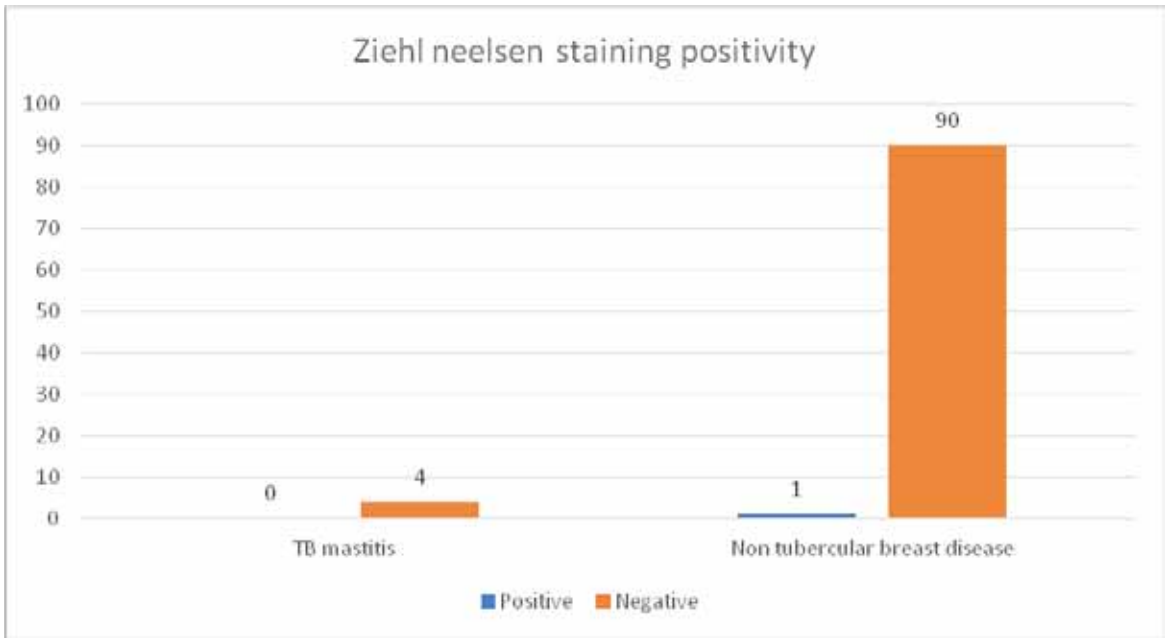

Figure 2 Bar diagram showing the significance of Ziehl-Neelsen staining in the diagnosis of tuberculosis of the breast

Figure 2 describes Tuberculous mastitis (TM) occurs far more frequently in women, especially in their reproductive age, and is uncommon in prepubescent and elderly women.

Treatment Modalities:

Tuberculosis of the Breast: In this study 4 cases of tuberculosis of breast were diagnosed. 3 of them presented as lumps and one as an abscess. Lumps were excised due to initial diagnostic uncertainty and abscess was drained by open drainage. Pus was sent for both Ziehl-Neelsen staining and AFB culture. Although Ziehl-Neelsen came out to be negative, AFB culture identified Mycobacterium Tuberculosis. All were given 9 months of antitubercular therapy with 2 months of intensive therapy with ethambutol (E) 1200 mg; rifampicin (R) 450 mg, isoniazid (H) 600 mg and pyrazinamide (Z) 1500 mg., followed by 7 months of ethambutol and isoniazid. Improvement was observed during our period of study, however, long term follows up was not possible.

Discussion

The relative incidence of various benign breast lumps in were found to be concurrent with other reported series of Sangma et al.,[6] Seema et al.,[7] Amruthavalli et al.,[8] Jagtap et al.,[9] and Abhijit MG et al.[10]

Significance of Ziehl-Neelsen staining in tuberculosis of breast: Four cases of tubercular mastitis were diagnosed, three of them presented as lumps while one presented as an abscess. All the lumps stained negative for Ziehl-Neelsen; however, it was histopathologically diagnosed as tubercular mastitis. Abscess aspirate also stained negative for Ziehl-Neelsen. Positivity of Ziehl-Neelsen staining was found to be statistically insignificant. This finding was consistent with the study by Gupta PP et al.[11] On all 7 patients of tuberculosis of breast in which the positive Ziehl-Neelsen stain was only in 38%, and was found to be statistically insignificant for the diagnosis.

Presentation of tuberculosis of breast: Among four patients diagnosed with tuberculosis of breast, 3 (75%) of them presented with a lump and 1 (25%) presented as an abscess. Finding was consistent with the study by Mallika Tewari and HS Shukla[12] on 30 patients with Tuberculosis of the breast in which 73% presented with lump and 27% with abscess.

Tuberculous mastitis (TM) occurs far more frequently in women, especially in their reproductive age, and is uncommon in prepubescent and elderly women.[13] This parallels the highest incidence of pulmonary tuberculosis. This could be because the female breast undergoes frequent changes during the period of childbearing activity and is more susceptible to trauma and infection.[14]

Treatment Modalities:

Tuberculosis of the Breast: Our treatment protocol was similar to that followed by Mallika Tewari and HS Shukla.[12] However the protocol followed by Prem Prakash et al.,[11] was of 6 months ATT and observed good response rate in 96% of the cases. In our study, there were only 2 cases of ductal papilloma and single case each of phyllodes tumour and ductal papilloma. Simple mastectomy was performed for the phyllodes tumour and microdiscectomy for ductal papilloma and duct ectasia. Wide excision is usually sufficient for phyllodes tumour however in this case size was large enough to make wide excision improbable. Techniques we followed were similar to the technique followed by Akshara et al.,[15] and Naveen et al.,[16] in their studies on benign breast disease for these lesions.

In the era of minimally invasive surgery, percutaneous drainage has proven a safe and effective alternative to incision and drainage in acute abscesses, while chronic and recurrent abscesses are best treated with the classical means of drainage. The method of percutaneous aspiration combined with irrigation and installation of antibiotics has proved effective in 96% of cases reported in one series.[17] In this current study, only patients with recurrent breast abscess were included. Hence, we performed emergency incision and drainage and pus was sent for culture and sensitivity. Our management method was similar to that followed by different studies on benign breast diseases.[18,19]

Conclusion

Benign breast diseases are essential to differentiate from malignant ones and also between one another. An appropriate diagnosis is key to have a proper outcome.

Iron Content as an Indicator for *Legionella* Species in Artificial Water Systems

Rajeshwari Vittal[1], Juliet Roshini Mohan Raj[2], Ballamoole Krishna Kumar[3], Indrani Karunasagar[4]

[1]Senior Lecturer, Nitte University Centre for Science Education and Research, Deralakatte, Mangaluru, India-575018, [2]Assistant Professor, Division of Infectious Diseases, [3]Assistant Professor, Division of Infectious Disease, [4]Director, Nitte University Centre for Science Education and Research, Mangaluru, India-575 018

Abstract

Background: *Legionella* have emerged as a pathogenic group due to increased use and poor maintenance of artificial water environments. World Health Organization considers *Legionella* associated diseases to be underestimated, especially in developing countries due to difficulty in detection. The aim of this study was isolation and culture of *Legionella* spp. from artificial water systems and to test the importance of iron concentration which can be developed as a reliable chemical marker.

Method: Thirty samples each were collected from drinking water coolers, cooling towers and shower heads fitted in different houses of Mangaluru city. Isolation and identification of the bacteria were carried out as per the standard protocols followed by determination of iron content prescribed by IS 3025 (Part 53).

Conclusion: Our study shows that concentrations of iron, is an important factor that increases the likelihood of *Legionella* spp. Statistically, a concentration of 300 mg Fe/L shows a positive correlation with *Legionella* presence. Therefore, monitoring suspect sites for iron concentration and chelation of available iron, can be developed as respective assays for identifying *Legionella* spp. Furthermore, we show that PCR based detection of *Legionella* is a more robust method than the classical 3-plate method, especially for virulent strains.

Keywords: *Cooling tower, iron content. Legionella, Legionnaires disease, potable water, water distribution systems.*

Introduction

Legionella, a genus of Gram negative, non-spore forming bacilli pervasively occurs in all aquatic habitats and is known to enter into the human-made water systems easily[1,2]. They are known to cause the mild to fatal Legionnaire's diseases (LD) and the milder Pontiac fever both commonly known as Legionellosis.

Among the pathogenic species, *L.pneumophila* is the most widely studied species; *L.longbeachae, L.bozemanii* and *L.micdadei* are other commonly detected agents of Legionellosis[3].

In developed countries, 2-9 % of all pneumonia cases are attributed to *Legionella* infection[4-8]. Lower than expected incidence of *L. pneumophila* infections from India are believed to be due to under-reporting as most of the infections are diagnosed as atypical pneumonia in community establishments and hospitals[7].

In the absence of a vaccine, the prime preventive measure forinfections is reduction/elimination of physical sources of infection . However, despite the repeated recommendations of thorough maintenance of the water systems, little scientific evidence exists to show the effect of regular maintenance in reducing *Legionella* load[8]. Therefore, there is an urgent need to develop novel bio/chemical markers for identification for this group of bacteria or the sites where they can thrive[9].

The conventional method for isolation of *Legionella* spp. includes pre-treatments followed by culturing on buffered charcoal yeast extract agar supplemented

with cysteine, iron, and antibiotics. In this study, water samples from various municipal sources, we show that the conventional method can give false positive results, therefore, PCR-based detection is a more robust method for detection. Moreover, iron content at the sampled sites and the presence of *Legionella* spp. show a strong statistical correlation, thereby suggesting that local iron concentration at suspect locations can be used as a chemical marker for probable *Legionella* growth.

Materials and Method

Sampling: Ninety samples were collected in total over a period of 2 years, from December 2016 to December 2018 . The study was conducted in Nitte University Center for Science Education and Research, Nitte (Deemed to be University), Deralakatte, Mangaluru. Thirty each samples were collected from local drinking water coolers, cooling towers and from shower heads fitted in different houses around Mangaluru city. samples were collected by strictly following the Indian Standard: Method of sampling and test for water and wastewater guidelines. All samples were processed within 4 hours of collection.

Isolation and culturing of samples: Isolation of *Legionella* from collected samples was performed as per US Centre for Disease Control and Prevention guidelines 2005. Briefly, each water samples were filter concentrated in a biological safety cabinet by pouring the samples onto a sterile membrane filtration funnel containing 0.2 µm, 45 mm diameter polycarbonate membrane filter. After filtration, the filter was removed aseptically from the holder with sterile filter forceps and placed into a centrifuge tube containing 5 ml sterile water. The centrifuge tube was then vortexed for 1 minute to recover bacteria and organic material from the filter. Buffered charcoal yeast extract (BCYE) supplemented with glycine, vancomycin, cycloheximide and polymyxin B (GVCP) antibiotics was used for isolation of *Legionella*. 2 BCYE plates and GVCP plates were inoculated with 100 µl suspension each and spread with a sterile spreader. The plates were incubated at 35 ºC in a candle jar for 72 hours.

Legionella pneumophila ATCC 33152 procured from LGC Promochem, Bangalore was used as a positive control for all the experiments. The lyophilized culture was resuscitated as per manufacturer's instructions.

PCR for detection of *Legionella* species: Template DNA was prepared by centrifuging the growth suspension at 12000 × g, for 5 minutes . The supernatant was discarded and the pellet uniformly resuspended in 100 µl sterile 100 mM Tris-EDTA by gentle vortexing. The resuspension was placed in a dry bath at 98 °C for 10 minutes and then flash cooled on ice. the cooled resuspension was used as the DNA template without further purification. 10 pM standard 16S JFP species specific primers were used for the detection of *Legionella pneumophila* and *Legionella* spp. Further, extracted DNA was used in a nested PCR for virulence detection by dot (defective organelle trafficking) amplification.

Determination of iron content: The iron content of each sample was measured by 1, 10 phenanthroline method as prescribed by IS 3025 (Part 53).

Results and Discussion

Legionella infections are primarily spread by man-made water systems and devices such as showers, whirlpool spas, and cooling towers which release contaminated aerosols. Inhalation of these aerosols especially by those with compromised immune systems leads to the infection[10]. WHO predicts that incidences of *Legionella* related disease outbreaks are under-reported in developing countries due to lack of clinical awareness. Reports of *Legionella pneumophila* incidence from India are limited in number and are mostly from clinical samples. Our study primarily aimed at determining the prevalence of *Legionella pneumophila* and its related species in the geographical location of Mangaluru, India and to determine chemical indicators. Isolation of *Legionella* species by culture technique and enrichment followed by molecular detection was performed for each sample . According to CDC protocol, *Legionella* spp. is positive on both BCYE and GVPC plates. Growth on GVPC plates is a unique characteristic of *Legionella* spp. and is used as confirmatory test, as other species are not known to grow on it. Cysteine deficient GVPC plates are used as a control, since cysteine supplement is essential for *Legionella* growth. Based on morphological features, both the agar plates in all the samples, predominantly showed round pearl-white colonies (Fig 1). Thus, suggesting that all the samples were positive for *Legionella* (Table 1). However, some control samples without cysteine supplement also showed *Legionella* like colonies on the agar plates. Repeated experiments showed growth of *Legionella* like colonies in a fraction of control samples, indicating experimental design problem. In our experiments, the 3-plates method for definitive identification of *Legionella* based on growth

characteristics, provided a fraction of false positive results. This demands for a more robust method for detection of *Legionella* spp. Thus, standard PCR with species specific primers and nested PCRs were set with dot gene specific primers to check the virulence of the samples (Table S1) .

Agarose gel-electrophoresis of the PCR products showed that from drinking water coolers, of the 30 samples, only 1 sample was tested positive and, 9 samples showed positive from cooling towers. Out of 29 tested positive in culture method from showerheads only 2 samples of 30 were positive (Fig 2). All the samples showing positive PCR for JFP-16S also showed positive for virulence gene (Figure 2 and Table 2). Thus, PCR method showed a higher specificity than culturing method in detection of *Legionella spp.*

Cooling towers are a part of the air-conditioning systems present in industries and hospitals, which use water to efficiently cool air via heat transfer[4,10,11]. The proportion of *Legionella* culture-positive cooling towers that have been reported from surveys conducted in Asia, Australia, Europe, and the United States is approximately 40%[8,12]. In this study, about a one third of the samples (30%) were positive for *Legionella* spp. by highly sensitive PCR detection and all the samples (30%) harboured the virulence genes used in the study.

*Legionell*a spp. have been frequently isolated from hospital shower heads but the question of whether aerosols of shower water or other exposures to potable water containing *L. pneumophila* may cause Legionnaires disease is yet unresolved. There have been limited reports on the presence and implications of *Legionella* in domestic shower heads. Shower heads from residences across Mangaluru reported 9 of 30 samples positive for *Legionella*. Drinking water is another source that is not generally checked for *Legionella* since the pathogen is generally contracted by aerosol spray. On an experimental basis, we looked into the presence of *Legionella* in drinking water from coolers and found 1 of 30 samples positive. The low temperatures of water in these coolers could probably be controlling the growth of this organism. However, the presence of *Legionella* in water that is considered potable is still a public health concern.

The biggest hurdle in testing for this organism is its fastidious nature. The conventional culturing technique is gold standard but takes as long as 14 days to confirm a result. Rapid detection method are the need of the hour for disease prevention and management of outbreaks if any[13]. Modern techniques like polymerase chain reaction, immunofluorescence and flow cytometry have been reported for rapid detection, but the cost of routine testing and availability of these facilities in testing laboratories across developing countries is very limited. Chemical parameter testing like estimation of iron is a relatively simple method that can be carried out without any requirement of sophisticated equipment and the process takes less than 4 hours to report the result.

To characterize *Legionella* harbouring surfaces, we looked for essential nutrients that *Legionella* needs for survival and flourishing. From the list of nutritional elements in *Legionella* culture medium, iron is an essential nutrient that can be easily detected and quantified by sensitive assays. Further, since iron is freely available in the environment in many different forms it can be expected to be a promising candidate as a chemical marker for the development of rapid detection of *Legionella*. Iron is an essential nutrient for *L. pneumophila* because its growth depends on the presence of iron in its culture medium and also plays a key role in its pathogenesis[14]. Recently there have been reports to implicate that the presence of cast iron rusting plays an important role in the development of *Legionella* in water distribution systems.

Interestingly, majority of the sites tested in our study had iron concentration higher than 300 mg/l. Routine BCYE and GVPC media used to culture *Legionella* is supplemented with 250 mg/l of iron for optimal growth. Among the different sites, cooling tower samples showed the highest proportion, at 80 % of samples with iron concentration >300 mg/ml. Drinking water coolers and showerheads showed high iron concentrations in 53 and 43 % samples respectively (Table 3). This proportionality of high iron concentration corelates with PCR positive *Legionella* samples, where cooling towers showed highest number of positive samples at 30 % while drinking water coolers and showerheads showed 2 and 6 % PCR positive samples, respectively (Table 4). It is noteworthy that all the PCR positive *Legionella* samples had iron concentration higher than 75 mg/l showing that low environmental iron concentrations are not conducive for growth. As hypothesized iron could be used as an indicator for *Legionella* in routine testing of water. Our study indicates that while concentrations up to 75 mg/l do not show a correlation with the presence of *Legionella* but 300 mg/l iron concentration is a strong

indicator of *Legionella* and thus can be used for routine monitoring.

Our study also shows that environmental monitoring should be an important and regular practice for preventive measures, which could begin with sites that are likely to have high local iron concentration. The WHO recommends that health care facilities should have a general water safety plan as a part of infection control and these plans should address microbial growth in addition to control of external contamination by *Legionella* and should include ancillary equipment like shower heads and medical devices.

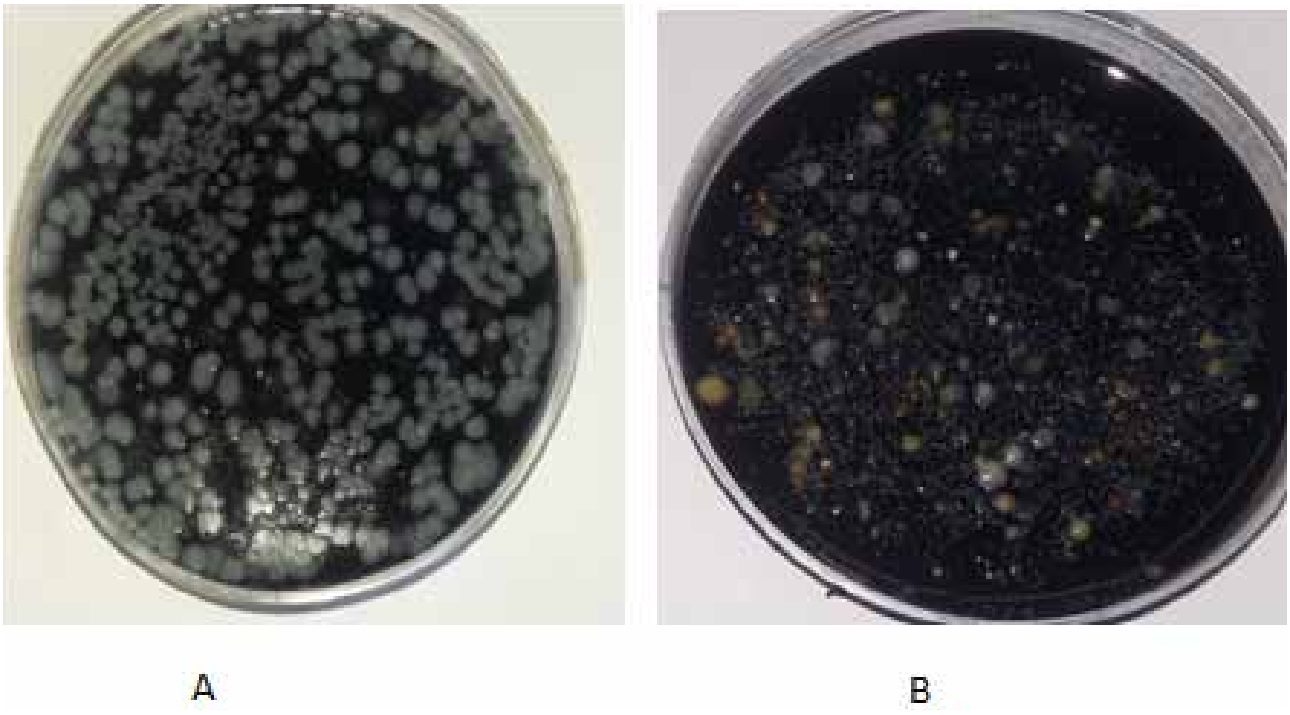

Figure 1: Representative *Legionella spp.* cultures, showing typical round pearl-white colonies on (a) GVPC and (b) BCYE agar plates.

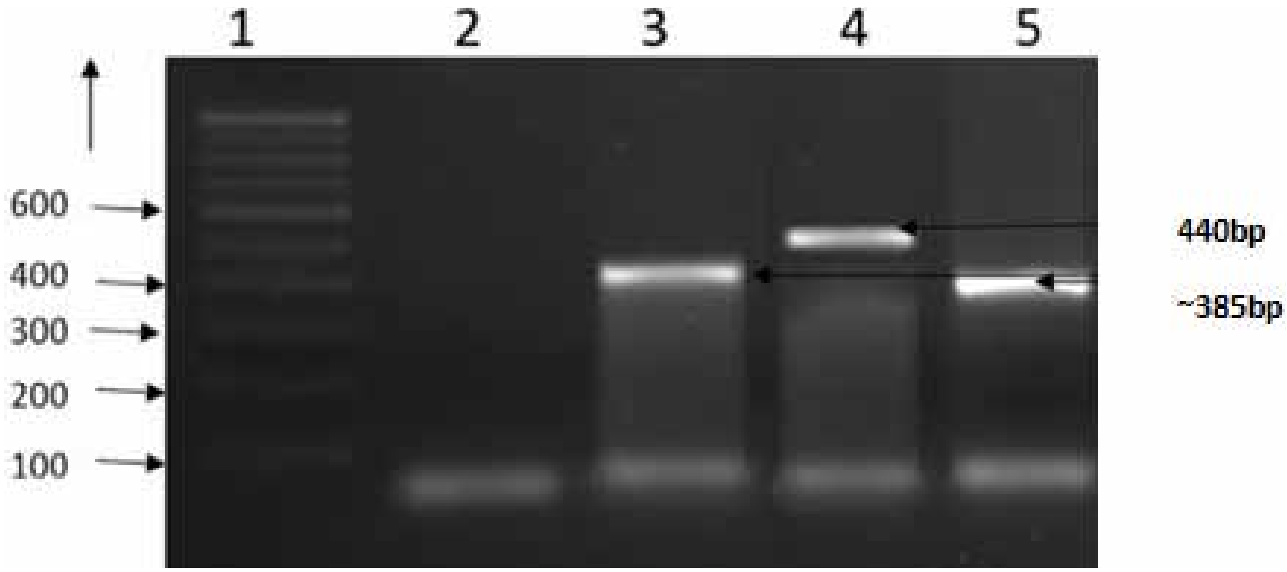

Figure 2. Representative agarose gel electrophoresis of one of the cooling tower samples. Lane 1: DNA ladder, lane 2: negative control, lane 3: JFP gene with expected size of 386 bp, lane 4: dot A step 1 product with expected size of 440 bp, lane 5: dot F step 2 product with expected size of 387 bp.

Table 1: Summary of *Legionella* positive cultures based on 3-plate method.

Sample Source	No. of samples	No. of positive BYCE plates	No. of positives GVPC plates	No. of positive GVP(w/cysteine)-plates
Drinking water coolers	30	30	30	10
Cooling towers	30	30	29	15
Showerheads	30	30	30	30

dotRM	CTTCCATTGAGTTTCACCAAATCA	
dotFK	GGTGATGGTTAATAATGATCCGGC	387
dotRM	CTTCCATTGAGTTTCACCAAATCA	

Conclusion

Legionella species were found to be prevalent in artificial water systems . The misconception that *Legionella* related diseases occur in developed countries alone should be overcome by public awareness and routine environmental monitoring. Our study indicates that 300 mg Fe/L is a reliable indicator of *Legionella* in case of cooling towers and thus can be used as first line of testing for potential sites for *Legionella* growth.

Practice of Documentation at Casualty of Tertiary Care Hospital: An Interventional Study

Ramasamy R.[1], Ganesh Rajendiran[2], Kagne R.N.[3]

[1]Assistant Professor, Department of Forensic Medicine & Toxicology, TMCH, Chennai, [2]Assistant Professor, Department of Forensic Medicine & Toxicology, SMVMCH, Puducherry, [3]Professor, Department of Forensic Medicine & Toxicology, SMVMCH, Puducherry

Abstract

A medical record plays a major role for the patient and health care sector in terms of treatment and making policies on certain diseases. In any suit of negligence, this medical record will help the doctors to defend them. Many a times the complete and accurate documentation only have helped the medical fraternities from getting entangled in various consumer cases made by the patient against the doctors. Even though we have seen so many negligence cases on doctors, documentations are still incomplete in any medical record. There are studies shown that the average time spent by a doctor on a medical record is very less and the scenario is much worse when it comes to critical areas of the hospitals like casualty where the time is very precious in treating the patient and not much of importance is given for documentation. So to identify the current practice of documentation of medical records, this study was carried out to assess the documentation practice of the admission case sheets in the casualty of SMVMCH, Puducherry. An intervention was done to improve the completeness of documentation in the casualty and post-intervention analysis was also done. The results of the study showed that the percentage of documentation out of the 34 variables documented in the admission case sheets found to have significant deficiencies. But following the intervention on improving the documentation there has be a significant decrease of the deficiencies in the documentation practice on all those 34 variables.

Keywords: *Medical record, Documentation, Casualty and Admission case sheet.*

Introduction

In a tertiary care hospital, medical records serve as a tool to provide better clinical care and to act as a means of communication between care providers.[1] Completed ocumentation of this medical record is very important, because the deficiencies in this documentation,have made the doctor's defenseless in medical negligence cases filed against them in the court.[2] Casualty being the first place of contact, a properly documented medical record is needed proper diagnosis and treatment.[3] Thus in view of a good patient care and to prevent a health care provider from negligence suits, a standardized medical record documentation is very essential. This needs to stress on the "Golden Rule" in documentation i.e. **"If it isn't written down, you didn't do it."[4]** Following the Honourable Supreme Court judgement in the year 1995, stating that "doctors also come under the perview of the Consumer Protection Act, 1986 which makes the medical faternity liable under the consumer forum for deficiencies in the quality care and treatment". To safeguard the physicians from these forums, the only defensive evidence was proper documentation which is the need of the hour.[5] So our study helps in identifying various deficiencies in the documentation of medical records mainly the admission case sheet in the casualty, followed by analysis and an interventional methodology to improve the same in the casualty, there by helping the patient to have a better care and the doctors to safeguard from litigations by having a proper documentation practice.

Materials and Method

The study was conducted at Department of Forensic Medicine,Sri Manakula Vinayagar Medical College and Hospital, Puducherry, after getting approval from the Institutional Ethics Committee approval (IEC NO-97/16). It was a hospital based cross-sectional study with pre and post interventional analysis, conducted for periods of 18 months from November, 2016 to April 2018. The case sheets of patients admitted under the department of medicine, surgery and orthopaedic in casualty were used as study sample. The total sample size was calculated, by using "Open Epi software version 3.0" taking into account the improvement in the documentation of case sheets from 16.0 % to 28.0 % based on previous study with 95% confidential interval and 80% power, as 680 case sheets.Out of total 680 case sheets, 340 case sheets were studied during the pre-interventional period and340 case sheets during the post-interventional period using simple randomized sampling method. All case sheets of patients admitted to Casualty by the concerned departments were taken for the study.**Exclusion Criteria:** Out Patient case sheets attending casualty, Case sheets of patients referred to other hospitals, Case sheets of patients patient admitted to casualty by other than the Medicine, Surgery and orthopaedics department faculty. The checklist proforma for case sheets was prepared after going through the guidelines on documentation by Medical Council of India, admission case sheet format of our hospital and review of literature. The checklist proforma was scrutinized and validated by the faculty from the department of Medicine, Surgery and Orthopaedics.**A total of 34 variables were identified from the admission case sheets and grouped into 6 categories for analysis purpose as follows: Category A: Socio-demographic variables (1.**Patient name, 2.Address, 3.Age, 4.Sex, 5.Income, 6.Hospital number, 7.Date of patient), **Category B: History variables** (8.Narrated by, 9.Referred by, 10.Brought by, 11.Presenting complaints, 12.Past history, 13.Personal history, 14.Family history), **Category C: Physical examination and vitals variables** (15.General examination, 16.Blood pressure, 17.Pulse rate, 18.Respiratory rate, 19.Glasgow coma scale), **Category D: Systemic examination variables** (20.CVS examination, 21.RS examination, 22.Abdominal examination, 23.CNS examination, 24.ENT/Eye examination, 25.Oral cavity examination), **Category E: Management variables** (26.Provisional diagnosis, 27.Plan of management, 28.Investigation) and **Category F: Doctor's variables** (29.Signature of the doctor, 30.Name of the doctor, 31. Designation, 32.Registration number, 33.Date, 34.Time).340 case sheets of the patients admitted under the Department of Medicine, Surgery and Orthopaedics in emergency Department were recorded in checklist proforma before intervention. The variables in the checklist were entered in "Microsoft Excel" analysed in "Epi data analysis software version 2.2.2.186" and the deficiencies were identified.Intervention was done in the form of workshop to the faculties and post graduates of Medicine, Surgery and Orthopaedics Departments. The deficiencies found in the admission case sheets were highlightened and its importance in both improving patient care and legal implications on doctor's side were discussed. After the intervention, again the checklist proforma was filled up from 340 case sheets of patientsduring the post-interventional period. The difference between the documentation in the case sheet for pre and post interventional periods were assessed usingChi Square test. P value <0.05 was considered as statistically significant. The completeness of documentation in the case sheet was compared between pre and post interventional periods.

Results

Total of 680 admission case sheets were analyzed,out of which 340 case sheets were analyzed in the pre intervention period and 340 case sheets in the post intervention period. Out of 340 admission case sheets in the pre-interventional period, 226 case sheets were of Medicine, 66 case sheets of Surgery and 48 case sheets of Orthopedics department. In the post-intervention, 192 case sheets belonged to Medicine, 89 case sheets to Surgery and 59 case sheets to Orthopedics.

However 340 pre and 340 post interventional admission case sheets of all three departments were collectively analysed and result were compared for this study. On Comparison of **"Socio-demographic variables"** (Table No. 1), except the variable of documenting Hospital number, rest all variable showed a significant increase in the practice of documentation in the post-intervention period.

Table No 1: Comparison of pre and post interventional documentation of socio demographic variables

S.No.	Socio demographic variables	Pre intervention (N=340)	Post intervention (N=340)	p value
		Number (%)	Number (%)	
1	Patient name	311 (91.5)	335 (98.5)	<0.001
2	Address	133 (39.1)	178 (52.4)	<0.001
3	Age	278 (81.8)	323 (95.0)	<0.001
4	Sex	277 (81.5)	321 (94.4)	<0.001
5	Date	219 (64.4)	259 (76.2)	<0.001
6	Income of patient	0 (0.0)	5 (1.5)	0.031
7	Hospital number	224 (65.9)	238 (70.0)	0.250

Table no 2 shows the details of documentation of **"History variables"** in the admission case sheets during the pre- and post- intervention period and its comparison analysis. Except the variables like referred by and past history, rest all variable showed a significant increase in the practice of documentation in the post-intervention period.

Table No 2: Comparison of pre and post interventional documentation of history related variables

S.No.	History variables	Pre-intervention (N=340)	Post-intervention (N=340)	p value
		Number (%)	Number (%)	
1	Narrated by	3 (0.9)	10 (2.9)	0.050
2	Brought by	143 (42.1)	177 (52.1)	0.009
3	Personal history	186 (54.7)	240 (70.6)	<0.001
4	Family history	96 (28.2)	150 (44.1)	<0.001
5	Referred by	11 (3.2)	20 (5.9)	0.098
6	Presenting complaints	340 (100.0)	340 (100.0)	NA
7	Past history	330 (97.1)	329 (96.8)	0.825

On comparison between the documentation practice of **"Physical examination and Vitals variables"**it was observed from the study that variables like BP, Pulse rate and General examination were documented properly even during the pre- intervention period itself.(Table No 3).

Table No 3: Comparison of pre and post interventional documentation of Physical examination and Vitals variables

S.No.	Physical examination and vitals variables	Pre intervention (N=340)	Post intervention (N=340)	p value
		Number (%)	Number (%)	
1	Blood pressure	316 (92.9)	310 (91.2)	0.394
2	Pulse rate	315 (92.6)	300 (90.3)	0.272
3	General examination	331 (97.4)	332 (97.6)	0.806
4	Coma scale	5 (1.5)	11 (3.2)	0.205
5	Respiratory rate	17 (5.0)	23 (6.8)	0.328

In this study, it was observed that doctors were proper in documenting the important variables like CVS, RS, CNS and Abdomen examination under the category of **"Systemic examination variables"**. (Table No 4).

Table No 4: Comparison of pre and post interventional systemic examination related variables

S.No.	System examination Variables	Pre intervention (N=340)	Post intervention (N=340)	p value
		Number (%)	Number (%)	
1	CVS examination	336 (98.8)	336 (98.8)	1.000
2	RS examination	335 (98.5)	336 (98.8)	0.737
3	Abdomen examination	335 (98.5)	335 (98.5)	1.000
4	CNS examination	331 (97.4)	329 (96.8)	0.650
5	ENT/Eye examination	153 (45.0)	142 (41.8)	0.395
6	Oral cavity examination	121 (35.6)	129 (37.9)	0.525

The study has shown that doctors have documented variables like Investigation and Provisional diagnosis without any fail in the admission case sheets during the pre- and post- intervention period under the category of **"Diagnosis related variables"**but during pre-intervention period documentation of Plan of management wasn't done properly but later on after the intervention it was done properly. (Table No 5).

Table No 5: Comparison of pre and post interventional management relatedvariables

S.No.	Diagnosis related variables	Pre intervention (N=340)	Post intervention (N=340)	p value
		Number (%)	Number (%)	
1	Plan of management	275 (80.9)	300 (88.2)	0.008
2	Investigation	329 (96.8)	336 (98.8)	0.067
3	Provisional diagnosis	337 (99.1)	339 (99.7)	0.316

In this study even though the doctors were found to be only proper in documenting their signature apart from other variables under the category of**"Documentation of doctor related variables"**during the pre-intervention period, later on after the intervention, significant improvement was observed in all the other variables as the doctors understood the importance of documenting these variables properly. (Table No 6).

Table No 6: Comparison of pre and post interventional doctor information relatedvariables

S.No.	Documentation of doctor variables	Pre intervention (N=340)	Post intervention (N=340)	p value
		Number (%)	Number (%)	
1	Signature	320 (94.1)	336 (98.8)	<0.001
2	Name of doctor	222 (65.3)	320 (94.1)	<0.001
3	Designation	271 (79.7)	316 (92.9)	<0.001
4	Registration number	176 (51.8)	298 (87.6)	<0.001
5	Date of treatment	219 (64.4)	259 (76.2)	<0.001
6	Time	4 (1.2)	11 (3.2)	0.068

Discussion

In our study total number of sample size was 680 case sheets which includes 340 case sheets of pre intervention period and 340 case sheets of post intervention period, taking into consideration of 34 variables from the admission case sheet, similar study was conducted by Vahedi HS et al,titled "an impact of educational intervention on medical record documentation in

Iran" with 900 sample which including 300 medical records on pre interventional periods, 300 records on post interventional periods after 1 month and also 300 medical records on post interventional periods after 6 months and they have recorded 17 variables from all the medical record including progress sheets and admission sheets.[6]

In our study documentation of patient identity related variables in pre interventional period showed that the name of the patient was recorded 91.5%,address 31.9%, age 81.8% and sex was recorded in 81.5% where the other study of Saravi PM et al, study titled on "documentation of medical records in hospital of Mazandaran university of medical sciencein 2014" showed that the demographic findings was recorded in 95% history sheet, 90% on progress notes, 77% on admission notes and 61% of summary seats.[7]

Some A et al, study titled on "audit of medical record in 2010" showed that socio demographic characterstic of name,age,sex, residence,occupation,marital status and religion were available in 26 to 99% of the case sheets. This study conducted on 368 medical record on the department of medicine, surgery, obstetrics and gynaecology and paediatrics. Name of the patient were recorded in 100% on medicine and surgery departmen and totally 99.73%, age of the patient were recorded 98.1%, sex of the patient were recorded 91%, residence were recorded in 72.6 % of medical records.[8]

Bhanot K et al, tittled on"Completness in clerking: the surgical admission proforma" showed that address and age were recorded 100%,date and time of admissionin and hospital number were recorded 96% intraditional clerking before proforma induced.[9] In our study documentation of personal history was recorded in 54.7 % on pre interventional period. Pastor G et al, 2010 study titled "the use of a pro-forma improves the quality of the emergency medical charts of patients with acute stroke" showed that personal history was recorded 98 % on medical records before inroducing pro-forma.[10]

Khoshbaten M EM et al, tittled an"The study of determination of re-education students and the faculty role in the improvement of medical record data files, proceeding of the 10th medical science education" showed that the training workshop will positively effect on documentation of medical records.[11] Tavakoli N et al, tittled an"The study of inpatient medical records on hospital educations": an interventional study showed that intervention and qualidative and quantitative analysis of medical records will improve the documentation of medical records as well as it's decrease the medical record deductions for more than 50%.[12]

Farzandipour et al, tittled an"A pilot study of the impact of an educational intervention aimed at improving medical record documentation" showed that the diagnostic accuracy was not increased in signle brief intervention.[13] The study by Tinsley et al[14] and other study by O Brien et al[15] sought that the documentation could be increased by education when it was reinforces with support of faculty members with regular feedback and also training regarding their charting quality.

Conclusion

The following conclusions were made from the study i.e. awareness about the completeness of documentation on medical records was present only certain areas of documentation like documenting the patient name, presenting complaints and systemic examination, whereas other areas had not been given much importance while documenting. Explaining the medical fraternity in modes of intervention on the importance of documenting medical records in present era of evidence based medical education and increasing cases of medical negligence against doctors has been more useful by evidencing significant improvement in the documentation practice of case sheets in this study. But still there is more scope for improving the documentation process by having frequent interventions and using structured documents customized for each department in a user friendly manner.

Risk Factors for Neonatal Death in Female Workers Mothers in Indonesia

Ratna Dwi Wulandari[1], Agung Dwi Laksono[2], Astridya Paramita[3], Pramita Andarwati[3], Naillul Izza[3]

[1]Lecturer, Faculty of Public Health, Universitas Airlangga Surabaya, Indonesia, [2]Researcher, National Institute of Health Research and Development, The Ministry of Health, The Republic of Indonesia, Jakarta, Indonesia, [3]Researcher, Functional Unit of Health Technology Innovation, The Republic of Indonesia, Jakarta, Indonesia.

Abstract

Female worker mothers have a greater risk of neonatal death during childbirth. The study aimed to analyze the risk factors for neonatal death among female worker mothers in Indonesia. The study used data of the 2017 Indonesia Demographic and Health Survey. With stratification and multistage random sampling, 18,061 female worker mothers aged 15-49 years old with live births in the last 5 years were sampled. The final analyzed using a binary logistic regression test. The results of the study found that female worker mothers with the wealth status of the poorer category had 0.738 times the probability of experiencing neonatal death compared to the poorest. Female worker mothers with wealth status in the middle category have a probability of 0.702 times compared to the poorest to experience neonatal death. Meanwhile, the richest female worker mothers had a probability of 0.662 times compared to the poorest to experience neonatal death. Meanwhile, female worker mothers who made ANC visits ≥4 times had a probability of 0.331 times compared to female worker mothers who made ANC visits <4 times. It could be concluded that there were 2 factors which are the risk factors for neonatal death among female worker mothers in Indonesia, namely poverty and ANC visits <4 times.

Keywords: *Neonatal death,maternal health, female worker, risk factor.*

Introduction

The third goal of the Sustainable Development Goals, which was formulated and agreed upon to be achieved by all countries without exception, is to ensure a healthy life and support the welfare of all for all ages. One of the targets set to achieve this goal is to reduce the neonatal mortality rate to at least less than 12 per 1,000 births by 2030[1].

Neonatal mortality is death that occurs before the baby is 28 days old. Neonatal Mortality Rate is the number of live births that died within the first 28 days of life, per 1,000 live births in a given year. Based on the age group of infants, neonatal mortality is categorized into two, namely early neonatal mortality and late neonatal death. Early neonatal mortality is the death of a live-born baby within the first week of life or 7 days after birth, which is also called perinatal death (infants aged 0-7 days). Late neonatal mortality is the death of a live-born baby at the age of more than 7 days to 28 days, that is, the second to the fourth week of life. In general, neonatal mortality is caused by endogenous factors, namely factors that the child carries from birth, which is obtained from the parents at conception or during pregnancy, as well as conditions during and after delivery such as the occurrence of nosocomial infections from the ward or due to bleeding diseases in newborn baby[2].

Global data in 2018 shows that 2.5 million children die in their first month of life, of which around 7000 newborn deaths occur every day with about one-third dying on the day of birth and nearly three-quarters

Corresponding Author:
Ratna Dwi Wulandari
Faculty of Public Health, Universitas Airlangga Surabaya, Indonesia, Campus C Mulyosari Surabaya, Indonesia
e-mail: ratna-d-w@fkm.unair.ac.id

of them dying within the first week of life. Neonatal mortality decreases more slowly than mortality in children 1-59 months of age[3]. Meanwhile, Indonesia recorded a fairly high neonatal mortality rate. Analysis of the Indonesian Demographic and Health Survey in 2017 reports that the Neonatal Mortality Rate in Indonesia reaches 15 neonates per 1000 live births. This achievement is higher than the achievement recorded by countries in the region[4].

Female workers are suspected of having a greater risk of experiencing neonatal death because of their dual duties to support daily family needs and pregnancy care. A previous study informed that female workers had a 1.52 times greater risk of experiencing neonatal death than non-female workers[5].Meanwhile, another study informed that women who do not work are more likely to experience neonatal pulse 0.576 times compared to female workers[6]. Based on the background description, the study was aimed at analyzing the risk factors for neonatal death among female worker mothers in Indonesia.

Materials and Method

The study used data from the 2017 Indonesian Demographic Data Survey (IDHS) as analysis material. The 2017 IDHS sample was determined through stratification and multistage random sampling. The unit of analysis in this study was female worker mothers, 15-49 years old, who had given birth in the last 5 years. Several 18,061 respondents were sampled.

Neonatal death is death in the neonatal period or the first twenty-eight days of life. Other variables analyzed as independent variables were a place of residence, age groups, education level, wealth status, parity, antenatal care (ANC), complication during pregnancy, childbirth assistance, and place of delivery. Place of residence divided into urban and rural. Age is the respondent's last birthday. The education level is the last educational certificate the respondent has.

Wealth status was a wealth of respondents compiled based on the index of goods ownership quintile stated by the respondent. The five categories were the poorest (quintile 1), poorer (quintile 2), middle (quintile 3), richer (quintile 4), and richest (quintile 5). Parity is the number of living children a woman has ever born. In this study, parity was divided into two, namely primiparous (<2 children), and multiparous (≥2 children).

Complications during pregnancy were the respondent's acknowledgment of complications experienced during pregnancy until delivery. These problems consist of: prolonged labor, vaginal bleeding, fever, convulsions, baby in the wrong position, swollen limbs, faint, breathlessness, tiredness, and others[4]. Childbirth assistance was divided into two categories, namely non-health workers and health workers. Meanwhile, the place of delivery consists of non-healthcare facilities and healthcare facilities.

Statistical analysis using chi-square was carried out to select the variables. Estimates were performed using binary logistic regression because of the nature of the dependent variable. All statistical analyses were carried out using SPSS 22 software.

Results and Discussion

The information in Table 1 shows that in both categories, neonatal death is dominated by female worker mothers who live in rural areas. The two categories of neonatal death were also dominated by female worker mothers in the 35-39 age group who had secondary education. Based on wealth status, the two categories of neonatal death were dominated by the poorest female worker mothers.

Table 1 shows that the two categories of neonatal death are also dominated by multiparous female worker mothers, and have incomplete ANC visits (<4 times). Meanwhile, based on complications during pregnancy, the two categories of neonatal death were dominated by female worker mothers who did not experience

complications during pregnancy. The two categories of neonatal death are also dominated by female worker mothers who are accompanied by health workers during childbirth, and who do childbirth in non-healthcare.

Table 2 provides the results of the multivariate test with binary logistic regression. There are 6 variables included in the final stage of determining risk factors for neonatal death among female worker mothers in Indonesia. The results of the analysis found that 2 variables were proven as risk factors for neonatal death among female worker mothers in Indonesia.

Note: $^{*}p < 0.05$; $^{**}p < 0.01$; $^{***}p < 0.001$.

First, female worker mothers with the wealth status of the poorer category had 0.738 times the probability of experiencing neonatal death compared to the poorest (OR 0.738; 95% CI 0.550-0.991). Female worker mothers with wealth status in the middle category had a probability of 0.702 times compared to the poorest to experience neonatal death (OR 0.702; 95% CI 0.514-0.960). Meanwhile, the richest female worker mothers had a probability of 0.662 times compared to the poorest to experience neonatal death (OR 0.662; 95% CI 0.468-0.937).

Information on the results of this analysis indicates that poverty is one of the risk factors for neonatal death among female worker mothers in Indonesia. The same findings of information were also found in the previous studies[7,8]. The results of the analysis informed that the richest group also had a risk of neonatal death, although the number was less than the other groups. This finding contradicts most studies which reveal that the low economic status (poorest, poorer, middle) is more at risk of neonatal mortality[9–11]. This information suggests that the economic status of the family, at any level, is likely to increase the risk of neonatal mortality. So that a more

comprehensive program approach is needed to reduce neonatal mortality.

The reason female workers leave their children to return to work early after childbirth is the demand to make a living for their families[12,13]. This condition also explains a large number of neonatal mortality rates in the group of working mothers with the poorest, poorer, and poor economic status. The pressure to make a living is greater in this group. The provision of paid leave for working mothers is one of the initiatives in the neonatal mortality reduction program recommended by WHO and ILO. Output in the form of maternal and neonatal health levels was found to be better for working mothers who received paid maternity leave for longer[14,15].

Second, female worker mothers who performed ANC completely (≥4 times) were 0.331 times more likely than female worker mothers who performed ANC incompletely (OR 0.331; 95% CI 0.229-0.480). The results of this analysis inform that doing ANC incompletely, or <4 times, is one of the risk factors for neonatal death among female worker mothers in Indonesia.

The findings of this analysis are in line with the recommendation of the Indonesian government which states that the ANC during pregnancy is done at least 4 times, namely in the first trimester 1 time, in the second trimester 1 time, and in the third trimester 2 times[16]. This information also confirms the results of previous studies in several countries that ANC is a positive determinant for preventing neonatal death[17–20]. Meanwhile, a study in Afghanistan informed that ANC by skilled providers reduced the risk of neonatal death to 0.7 times compared to non-skilled providers[21].

Conclusions

Based on the research results, it could be concluded that 2 factors are the risk factors for neonatal death among female worker mothers in Indonesia. These two factors were poverty and incomplete ANC.

It is recommended that the government issue a policy that can encourage companies that employ female worker mothers to facilitate the ANC process when they are pregnant, especially for poor female worker mothers. Working mothers in the formal sector need to be paid maternal leave for at least 12 weeks after giving birth to provide opportunities for mothers to care for their babies. For mothers working in the informal sector, it is necessary to think about providing a social safety net in the form of maternal cash benefits that can be implemented together with the National Health Insurance. This policy is needed to reduce neonatal death in Indonesia.

Abstract

MMR data in Indonesia fluctuates according to the data source used. Based on Indonesia Demographic and Health Survey data, MMR in Indonesia in 1990 was 390 per 100,000 live births, in 2004/2007 it was 228/100,000 live births, then increased sharply in 2008-2012 by 359/100,000 live births. Whereas based on the 2015 SUPA data, MMR in Indonesia decreased by 305 per 100,000 per live birth. This study aims to analyze the barrier to ≥4 ANC visits during pregnancy. The analysis uses the 2017 Indonesian Demographic and Health Survey data. Stratification and multistage random sampling method get 15,351 respondents. Barrier determination was done using Binary Logistic Regression. The barriers consisted of the following variables: young age, low education, high parity, poverty, not having health insurance, not being able to read, not being exposed to the media, never using the internet, not knowing the danger signs of pregnancy, and belief in traditional birth attendants.

Keywords: *Antenatal care, healthcare utilization, the barrier of utilization, mother and child health.*

Introduction

Maternal Mortality Rate (MMR) is an indicator of the level of women's health that illustrates the level of access, integrity, and effectiveness of the health sector. Therefore, MMR is often used as an indicator of the welfare level of a country. Since 1988, the Indonesian Ministry of Health has focused its policy on improving maternal health and well-being, as MMR's reaction is still high in Indonesia. Starting from the "Safe Motherhood" program in 1988, the Dear Mother Movement in 1996, the National Strategic Plan for Making Pregnancy Safer in 2001-2010, Birth Assurance in 2011, to the National Action Plan for Acceleration in Decreasing Maternal Mortality Rates 2013-2015[1].

MMR data in Indonesia fluctuates according to the data source used. Based on Indonesia Demographic and Health Survey Data, MMR in Indonesia in 1990 was 390 per 100,000 live births, in 2004/2007 it was 228/100,000 live births, then increased sharply in 2008-2012 by 359/100,000 live births. Whereas based on the 2015 SUPA data, MMR in Indonesia decreased by 305 per 100,000 per live birth[1].

One of the policies to reduce MMR in Indonesia is an effort to improve the quality of health services, especially pregnant woman examination services by professionals who are following integrated Antenatal Care (ANC) service standards. Minimum ANC standard services include 1) Measure Weigh; 2) Measure the circumference of the upper arm; 3) Measure blood pressure; 4) Measure fundal height; 5) Calculate fetal heart rate; 6) Determine the fetal presentation; 7) Give TT immunization; 8) Give blood plus tablets (Fe); 9) Check routine and specialized laboratories (blood type examination, blood hemoglobin level check, urine protein check, blood sugar level check, malaria blood test, syphilis test, HIV test, and smear examination); 10) Management or handling of cases[2].

Several recent studies have shown that health-seeking behavior is influenced by individual and household factors, including education, marital status,

e-mail: ratna-d-w@fkm.unair.ac.id

wealth status, health insurance[3], and health belief[4]. Besides, external factors such as the availability of information and media exposure also contribute to health-seeking behavior[5].

This study was conducted to analyze the barrier of the use of ≥4 ANC visits during pregnancy in women aged 15-49 years old who gave birth in the last five years in Indonesia. The results of this study are useful for the Ministry of Health to determine the acceleration of ANC utilization policy of at least 4 visits during pregnancy to reduce maternal mortality in Indonesia.

Materials and Method

This research was conducted using secondary data from the 2017 Indonesian Demographic Data Survey (IDHS). The IDHS was part of the International Demographic and Health Survey program conducted by the Inner City Fund. The 2017 IDHS sampling method was done by stratification and multistage random sampling. With the analysis unit of women aged 15-49 years old who had given birth in the last 5 years, a sample size of 15,351 women was obtained.

Following recommendations from the Ministry of Health, ANC was performed at least 4 times during pregnancy, which was at least 1 time in the first trimester, at least 1 time in the second trimester, and at least 2 times in the third trimester[6].Other variables analyzed are the place of residence, age, marital status, education level, parity, wealth status, health insurance, literacy, media exposure, frequency of media, use of the internet, know the danger of pregnancy, and belief in traditional birth attendants. Barrier determination was done using Binary Logistic Regression because of the nature of the dependent variable. All statistical analyses were carried out using SPSS 21 software.

Results and Discussion

Table 1 is a statistical description of the socio-demographic characteristics of respondents. There are significant differences between women who make <4 ANC visits compared to women who make ≥4 ANC visits in all socio-demographic categories. Women who make ≥4 ANC visits are more dominant in urban areas and the 30-34 age group.

Table 1 informs that women who make ANC visits during pregnancy are dominated by women who are married or living with partners. The education level category is dominated by secondary education women. Table 1 shows that women who made ANC visits during pregnancy were dominated by women who had parity 2-4 and were very poor. Dominance is also shown by women who are covered by health insurance.

Table 2 is a statistical description of the characteristics of knowledge and information exposure of respondents aged 15-49 years old who gave birth in the last five years in Indonesia. Table 2 informs that there are significant differences between women who make <4 ANC visits compared with women who make ≥4 ANC visits during pregnancy in all categories.

Table 2 shows that women who were able to read whole sentences were exposed to the media less than once a week, and had never used the internet were more dominant in both ANC frequency categories. While in the "know the danger sign of pregnancy" category, the group of women who made ≥4 ANC visits during pregnancy was dominated by those who knew. While the group of women who made ≥4 ANC visits during pregnancy was dominated by those who did not know. Table 2 informs us that in both categories ANC frequencies were dominated by women who did not believe in traditional birth attendants.

Table 2. Knowledge and exposure of information (n=15,351)

Table 3 shows the results of the binary logistic regression test which illustrates the barrier of using ANC in Indonesia. As reference is <4 ANC visits during pregnancy. Table 3 shows that women in the 15-19 age group were 0.286 times more likely than women in the 44-49 age group to make ≥4 ANC visits during pregnancy. While women in the 20-24 age group were 0.569 times more likely than women in the 44-49 age group. This shows that younger age is a barrier to make ≥4 ANC visits during pregnancy. A study in Angola from a different perspective also found similar results. The study found that older women had better chances of utilizing ANC[7].

Note: *p<0.05; **p<0.01; ***p<0.001.

The women with primary education are 1.593 times more likely than no education women to make ≥4 ANC visits during pregnancy. While women with secondary education were 1.713 times more likely than no education. This condition shows that uneducated is a barrier to ≥4 ANC visits during pregnancy. The result is similar to previous research that found the same phenomenon[8]. The higher a person's education, the better her chance in utilizing health services, because she knows about her needs, and knows how to fulfill them[9–11].

The research shows that have many children is a barrier to making ≥4 ANC visits. The results of this analysis are in line with studies conducted in Eastern Ethiopia. The study found that primiparous and multiparous women had lower birth preparedness and complication readiness than primiparous women. Having many children was also informed as a predictor of neonatal death in Indonesia[12,13]

Wealth status in all categories there is a better chance than the poorest women. The richer the more likely it is to make ≥4 ANC visits. This condition shows that poverty is a barrier to ≥4 ANC visits during pregnancy. Moreover, the women who were covered by health insurance had 1.408 times more likely than women who were not covered by health. This shows that not having health insurance is a barrier to making ≥4 ANC visits during pregnancy.

Poor and without health insurance were found as barriers to get ≥4 ANC visits. These two conditions are interrelated. In general, it is known that health insurance can increase public access to health care facilities[14]. The same condition also applies to accessibility to get ≥4 ANC visits. Not having health insurance is a barrier to getting ≥4 ANC visits during pregnancy. Health financing policies in Indonesia try to reduce this barrier by providing subsidies for contributions to the National Health Insurance mechanism. It is hoped that this policy can improve the access of the poor to health services, including the ANC[15].

Table 3 informs us that in the literacy category, women who were able to read whole sentences were 1.385 times more likely than women who could not read

at all to make ≥4 ANC visits. This condition shows that the inability in literacy is a barrier to make ≥4 ANC visits during pregnancy. This finding is in line with the results of research in Afghanistan which found that women who could read were three times better than those who could not read when using ANC[16]. Literacy ability is a determining factor in the level of knowledge of obstetric danger signs and perceptions of the need for obstetric care[17].

Table 3 shows that women who were exposed to the media were 1.366 times more likely than women who were not exposed to the media to make ≥4 ANC visits. This shows that media exposure is a barrier to making ≥4 ANC visits during pregnancy. While the frequency of media exposure did not show any influence on the ANC frequency. Moreover, the women who used the internet last 12 months were 1.413 times more likely than women who never used the internet. This shows that never using the internet is a barrier to making ≥4 ANC visits during pregnancy. This condition is in line with the inability to read and low education, as well as its effects, being ignorant of the danger signs of pregnancy.

Table 3 shows that women who knew the danger sign of pregnancy were 1.900 times more likely than women who did not know the danger sign of pregnancy. This shows that ignorance of the danger sign of prevention is a barrier to making ≥4 ANC visits. While the women who believe in traditional birth attendants are 0.527 times more likely than women who do not believe in traditional birth attendants. This shows that belief in traditional birth attendants is a barrier to make ≥4 ANC visits during pregnancy. Indonesia has thousands of ethnic groups. There are still many health beliefs that exist among these tribes. This condition encourages Indonesian women to still trust traditional birth attendants[4].

Conclusions

Based on the results of the study, it could be concluded that 10 variables become a barrier for Indonesian women to make ≥4 ANC visits during pregnancy. The barriers consisted of the following variables: young age, low education, high parity, poverty, not having health insurance, not being able to read, not being exposed to the media, never using the internet, not knowing the danger signs of pregnancy, and belief in traditional birth attendants.

A Questionnaire Based Study Evaluating Awareness for Organ and Body Donation and Cadaveric Dissection among the General Population Attending Medical and Dental Hospital

K.M. Parmar[1], Hetal Vaisnani[2], Nirali Chavda[3], Priyanka Sharma[4], Kinjal Jethava[1]

[1]Associate Professor, [2]Professor, [3]Tutor, [4]Assistant Professor, Dept of Anatomy, Smt. B.K. Shah Medical Institute & Research Center Sumandeep Vidyapeeth and Institution Deemed to be University, Piparia, Vadodara Gujarat

Abstract

Introduction: This study intended to assess the awareness among subjects regarding body donation and cadaveric dissection and their willingness to donate body.

Methodology: A cross sectional study conducted in Anatomy Department, SBKS Medical Institute and Research Centre, Vadodara. A self-administered questionnaire containing 18 questions was to be filled by the participants in 15 minutes. Responses of participants were collected and analysed.

Results: 130 participants were enrolled, 47.69% were males while 52.31% were females. Majority (38.46%) were ≥45 years in age. Around 41.54% of the participants had received no schooling. Majority of the participants were unaware of the Organ (54.62%) and Body donations (63.85%), however, around 51.54% of the subjects were aware of the cadaveric dissections occurring in medical colleges. Also, 50.77% agreed for body donations. As compared to males, higher proportion of females were aware of the organ (47.1%) and body (38.2%) donations and 61.8% females were willing to donate bodies. Higher proportion of subjects in the age groups of 26-45 years were aware of organ (52.3%) and body (38.6%) donation and cadaveric dissection (65.9%), however, proportionately more subjects in the age group of 18-25 years (77.8%) were willing to donate body. A higher proportion of subjects with college education were aware of the organ (84.6%) and body (92.3%) donation and cadaveric dissection (92.3%) and were also willing to donate body (92.3%).

Conclusion: Gender, education and socioeconomic background have an impact on organ/body donation and willingness to donate body.

Keywords: *Body donation, Cadavers, Female, Male, Participants.*

Introduction

One of the fundamental subjects for medical student is Human Anatomy. With the surge in the number of medical colleges and number of students in medical colleges the demand of cadavers has risen drastically.[1] However, there is mismatch in demand and availability of the same. This makes is necessary to increase the awareness among the masses about body donation and thus to meet the ever increasing requirements of the medical colleges.[2] The first step in this direction can be taken by spreading the awareness among the patients attending medical and dental colleges. This study intended to assess the awareness among participants regarding body donation and cadaveric dissection and their willingness to donate body. The findings of this study would help set goals and take necessary steps for increasing awareness among masses.

Materials and Method

This was a cross sectional study conducted in Department of Anatomy of SBKS Medical Institute and Research Centre, Piparia, Vadodara from December 2019 to February 2020. A self-administered questionnaire was to be filled by the participants. The questionnaire evaluated awareness, attitude, knowledge and willingness towards body/organ donation based on 18 points scale. Subjects were given questionnaire in the vernacular language and were asked to clarify doubts if any, prior to filling the questionnaire. The questionnaire had multiple choice questions and a separate space for providing personal option was also provided for each question. The researcher made the participants fill questionnaire in their presence and did not allow cross discussion among participants while filling it. Duly filled and signed questionnaire were collected from the participants. Each participant was given 15 minutes for filling the questionnaire.

A total of 130 participants, attending medical and dental outpatient department and providing written informed consent for participation in the study and agreeing to fill the questionnaire were enrolled in the study.

Inclusion Criteria:

i. Patients attending OPD department of medical and dental hospital

ii. Patients aged 18 years and above

iii. Those willing to give written informed consent for participation in the study

Exclusion Criteria:

i. Medical and dental students, doctors and faculty members were excluded

ii. Those that did not give consent for participation in the study

The study was conducted an aim to study gender and age group based difference in awareness and willingness for organ and body donation and to evaluate familiarity with cadaveric dissection. The study also evaluated the impact of literacy on the awareness. The subjects were divided as those having no school education, those with primary, secondary, higher secondary and college education.

Data was entered in MS excel and analysed. Frequencies and percentages were calculated. Significance was assed using Chi square test.

Results

A total of 130 questionnaire were collected and analysed.

Of the total subjects enrolled, 47.69% were males while 52.31% were females as shown in table 1. The age distribution of the population showed that a higher proportion of males and females were ≥45 years in age.

Table 1: Gender and Age distribution of participants

	Males		Females		Total		P-value
Gender Distribution	N	%	N	%	N	%	
	62	47.69%	68	52.31%	130	100%	0.0212
Age group (years)	N	%	N	%	N	%	
18-25	17	27.42%	19	27.94%	36	27.69%	
26 – 44	21	33.87%	23	33.82%	44	33.85%	
≥45	24	38.71%	26	38.24%	50	38.46%	0.0412

When the literacy of the study group was evaluated, it was observed that higher proportion of the females (45.59%) had no schooling as compared to males. The literacy of the population was on lower side as shown in table 2.

Table 2: Literacy status of participants

Literacy	**Males**		**Females**		**Total**		**P-value**
No schooling	23	37.10%	31	45.59%	54	41.54%	0.0113
Primary	8	12.90%	15	22.06%	23	17.69%	
Secondary	12	19.35%	9	13.24%	21	16.15%	
Higher secondary	11	17.74%	8	11.76%	19	14.62%	
College educated	8	12.90%	5	7.35%	13	10.00%	

Majority of the participants were unaware of the Organ (54.62%) and Body donations (63.85%), however, around 51.54% of the subjects were aware of the cadaveric dissections occurring in medical colleges. Also, 50.77% agreed for body donations.

Table 3: Awareness and willingness among participants

Awareness/Willingness among participants	Aware		Not aware	
	N	%	N	%
Organ donation	59	45.38%	71	54.62%
Body donation	47	36.15%	83	63.85%
Cadaveric Dissection	67	51.54%	63	48.46%
Willingness for donation	66	50.77%	64	49.23%

Gender based evaluation of awareness of donation showed that as compared to males, higher proportion of females were aware the organ (47.1%) and body (38.2%) donations and 61.8% females were willing to donate bodies. (Table 5).

Table 4: Gender based evaluation of awareness

	Organ donation				**Body donation**				**Cadaveric Dissection**				**Willingness for donation**			
	Aware		**Not aware**		**Aware**		**Not aware**		**Aware**		**Not aware**		**Yes**		**No**	
	N	**%**	**N**	**%**	**N**	**%**	**N**	**%**	**N**	**%**	**N**	**%**	**N**	**%**	**N**	**%**
Males	27	43.5%	35	56.5%	21	33.9%	41	66.1%	30	48.4%	32	51.6%	24	38.7%	38	61.3%
Females	32	47.1%	36	52.9%	26	38.2%	42	61.8%	37	54.4%	31	45.6%	42	61.8%	26	38.2%

Age group based evaluation, as shown in table 6, suggested that higher proportion of subjects in the age groups of 26-45 years were aware of organ (52.3%) and body (38.6%) donation and cadaveric dissection (65.9%), however, proportionately more subjects in the age group of 18-25 years (77.8%) were willing to donate body.

Table 5: Age based evaluation of awareness

Age groups	**Organ donation**				**Body donation**				**Cadaveric Dissection**				**Willingness for donation**			
	Aware		**Not aware**		**Aware**		**Not aware**		**Aware**		**Not aware**		**Yes**		**No**	
	N	**%**	**N**	**%**	**N**	**%**	**N**	**%**	**N**	**%**	**N**	**%**	**N**	**%**	**N**	**%**
18-25	14	38.9%	22	61.1%	12	33.3%	24	66.7%	22	61.1%	14	38.9%	28	77.8%	8	22.2%
26 - 44	23	52.3%	21	47.7%	17	38.6%	27	61.4%	29	65.9%	15	34.1%	24	54.5%	20	45.5%
≥45	22	44.0%	28	56.0%	18	36.0%	32	64.0%	22	44.0%	28	56.0%	14	28.0%	36	72.0%

As shown in table 7, a higher proportion of subjects with college education were aware of the organ (84.6%) and body (92.3%) donation and cadaveric dissection (92.3%) and were also willing to donate body (92.3%).

Table 6: Literacy based evaluation of awareness

Literacy	Organ donation				Body donation				Cadaveric Dissection				Willingness for donation			
	Aware		Not aware		Aware		Not aware		Aware		Not aware		Yes		No	
	N	%	N	%	N	%	N	%	N	%	N	%	N	%	N	%
No schooling	11	20.4%	43	79.6%	9	16.7%	45	83.3%	15	27.8%	39	72.2%	15	27.8%	39	72.2%
Primary	9	39.1%	14	60.9%	7	30.4%	16	69.6%	11	47.8%	12	52.2%	11	47.8%	12	52.2%

Discussion

Organ and body donation is a noble cause. The need to spread awareness among the masses about organ/body donation led to conduct of this study. The intent was to evaluate the awareness of general public about organ/ body donation. In Current study, it was view that forty thirty eight percentages. of the subjects were aware of organ donations while only 36.15% subjects were aware of body donation. However, in the study by Charmode SH, et al. overall awareness about organ donation and body donation was 63.39 %and 70.09 %, respectively. This was higher compared to our study, the reason for the same may be due to the fact the study by Charmode SH, et al. was conducted in medical and dental students whereas our study was conducted in patients attending medical and dental OPD.[1] The fact that our hospital receives drainage from rural population may also have impact on the outcome of the study. The reasons for the same are as follows: a higher proportion of subjects lack literacy, this is reflected from the fact that 41.54% of the subjects received no schooling while 17.69% subjects had received primary education. Dope SA et al have highlighted the fact that education background of the subjects influences their understanding of organ/body donations and also influences their willingness to donate body.[2]

Charmode SH, et al. also observed that medical students as compared to other student were more acquainted with cadaveric dissection and had better awareness regarding organ donation (91.86%) and body donation (94.18%) as compared to general public/ patient (nonacquainted group). Similar findings were also observed by Chung CK et al and P Burra, Burra P, et al.[4,5]

In the study by Dope SA et al where in the data was collected from patients vising the hospital, it was observed by the authors that total 68% people were knowledge about body donation and were also aware that cadavers or donated bodies were purpose for the medical student study. [2] Bharambe V K et al in their study conducted in patients attending OPD observed that 78% participant were aware of Organ donation concept but 22% were unaware of the same.[3]Chung CK et al in a study conducted in medical students observed that among the student of 3, 4 and 5th years, 67% of the questions correctly, while only of years 1 and 2 students answered correctly. [4]Panshewdikar P et alobserved that 76.84% of the enrolled subjects were aware about the body donation.[6] Singh LP and Vyas PC in their study conducted in nursing staff observed that all the staff members were aware of the donation process.[7] Tamuli RP et al observed in their study that 79.17% (285) of participants were aware about organ donation. [8]

In the present study 50.77% of the subjects were willing to donate body. The willingness was more among females and in those that had higher educated. It was also high in those in the age group of 18-25 years, this may have been due to the fact that young and educated are more aware of the importance of body donations. Those that rejected the idea of body donation gave religion as the reason for the same, majority of the times. In the study by Dope SA et al around 41% person did not believe in body donation and religious beliefs was the commonest reason behind the same. Also, 10% of the total believed donated bodies were being misused. [2] Even in the studies by Charmode SH, et al, Bilgel H et al and Tamuli RP et al a higher proportion of females were willing to donate bodies and showed better awareness of the concept of organ and body donations.[9]

Balajee KL observed in their study that 88% of the subjects were aware of organ donation and awareness was highest (98.8%)in the 18–30 years age group, male 91% and those educated to higher secondary and above 100%.[10]

Thus it can be seen that there are various factors that influences the awareness of the population regarding organ/body donation and their willingness to donate body.

Conclusions

Females have better awareness of the process of organ/body donation and have proportionately higher willingness to donate body. Education and socioeconomic background have an impact on it.

Assessment of Scapula Muscle Strength in Housemaids

Riddhi Shroff[1], Ankita Jain[2]

[1]Assistant Professor, School of Physiotherapy, D.Y. Patil University, Nerul, Navi Mumbai,
[2]Clinical Physiotherapist, Bangalore, D.Y. Patil Hospital, Nerul, Navi Mumbai-40005

Abstract

Introduction: Neck and upper limb musculoskeletal disorders are a major source of disability which is also resulting in economic loss. Housemaids are exposed to repetitive tasks which causes them to be at high risk of neck pain. This result in increased burden on health care costs and also adds to reduced work productivity. The aim of the study is to evaluate scapula muscle strength in housemaids to determine magnitude of the problem.

Methodology: A total of 100, divided as 50 participants in housemaid group with neck pain and 50 age matched normal individuals in the asymptomatic group were recruited for the study. Self made questionnaire and scapula muscle strength were tested using push - pull dynamometer.

Results and Discussion: The study highlights the weakness of scapula muscle strength with neck pain in housemaids as compared to asymptomatic group. This gives us an insight into significance of scapula muscle strength in neck pain cases which will help us in formulating effective treatment strategies for treating neck pain cases.

Keywords: *Neck, Pain, Housemaids, Strength, Scapula.*

Introduction

Neck pain is a commonly treated musculoskeletal condition by health care professionals. It has been estimated that the annual prevalence of neck pain in the general population is 30- 50% with the prevalence of activity limitations due to neck pain ranging between 11-14%.[1,2]

Neck and upper limb Musculoskeletal Disorders (MSDs) represent a major source of disability globally and have resulted in a major socio-economic affection.[3,4,5] The majority of individuals who experience acute neck pain symptoms do not seek medical care, which further progresses to chronic neck pain. It has a prolonged negative impact on health care expenditures.[6]

Housekeeping is a physically challenging job which requires repetitive tasks specially with upper limb. There arevarious push-pull activities that stresses biomechanical structures which leads to exposure of many high-risk factors for neck and upper limb (MSDs).[7,8,9] Studies conducted across countries have demonstrated a high magnitude of the neck and upper limb

MSDs among housekeepers.[7,10,11,12] Coming to India, where lower socioeconomic strata of women are involved as housemaids for maximum hours in a day,which involves extensive household chores that predisposes them to a constant risk of developing various neck and upper limb related musculoskeletal disorders.

Previous studies have demonstrated impaired cervical flexor muscle performance in subjects with neck pain.[13] Exercises directed toward these muscles has been shown beneficial.[14] There is emerging evidence that scapulothoracic muscle weakness may also be associated with neck pain.[15,16]

The purpose of this study was to examine

scapulothoracic muscle strength in housemaids on the side of neck pain compared to the unaffected side. A second purpose was to compare muscle strength of housemaids with age matched normal subjects without neck pain.

Materials and Method

After the institutional ethics committee approval. 50 participants in housemaid neck pain group and 50 age matched normal individual in the asymptomatic group were recruited for the study in the age group of 18 and 60 years of age.

Housemaid Neck Pain group had to have one of the following- Central and/or unilateral neck pain for more than 1 month, Limitation in neck range of motion, referred shoulder girdle or upper extremity pain.

To be included in the asymptomatic group, participants should have no complaint of neck and shoulder pain. Individuals were excluded from either group if they had evidence of central nervous system involvement, pathological reflexes, or demonstrated positive neurologic signs consistent with nerve root compression. Individuals were not eligible to participate if they reported previous spinal surgery.

Procedure: Five Scapula-humeral muscle groups were tested with Hydraulic Push-Pull Dynamometer. During testing of External and Internal rotators of Shoulder joint,subjects were seated with proper body alignment in a high sitting position, with towel roll under the axilla, and with both feet placed flat on the foot stool. Middle and lower trapezius were checked by adopting prone position with towel placed under the forehead. Modified Kendall position was used to test serratus anterior in supine position. The "break test" was used for the testing procedures.[17]

The maximal force is resisted by the examiner, applied by the subject. The "breaking force" is the amount of force required to overcome a maximal effort muscle contraction in order to move the limb from the initial starting position.[18] Three trials were done for all the muscles were tested using this technique.

Results

Table 1: Demographic Details

Variable	Neck Pain group	Asymptomatic group
Age	42±3.41	42±3.41
Duration of working (hours)	14±1.24	10±1.77
Rest periods (hours)	1±0.66	1± 0.85

Table 2: Intra Group Strength

Variable	Painful side	Non Painful side	P value
External Rotators	3.97	4.33	0.001
Internal Rotators	4.52	5.39	0.000
Middle Trapezius	6.94	7.43	0.000
Lower Trapezius	6.88	7.38	0.001
Serratus Anterior	8.85	9.26	0.001

Table 3: Inter Group Strength

Variable	Neck Pain group	Asymptomatic group	P value
External Rotators	3.97	4.55	0.000
Internal Rotators	4.52	5.45	0.000
Middle Trapezius	6.94	7.50	0.000
Lower Trapezius	6.88	7.78	0.000
Serratus Anterior	8.85	9.51	0.000

Discussion

The results of this study suggest statistically significant lower scapulothoracic muscle strength values in housemaids with neck pain compared to asymptomatic individuals. The mean scores of the strength values were lower on the painful side in housemaids with neck pain. There is a strong interrelationship between chronic neck and scapula dysfunction. This can be attributed to close association between the scapula and the cervical spine which is connected through the axioscapular muscles.[19,20]

One potential reason for impaired scapulothoracic muscle strength in housemaids with neck pain is during strength testing,subjects did not exert maximum effort as pain might be a barrier.[21] Secondly,our study shows that housemaids are involved in long working hours with inadequate rest breaks. This results in prolonged repetitive movements which is exhausting. Also, the worker is unable to recover in the short rest periods of time between work duration, thus exposing at increased neck and upper limb MSDs.[22]

In our study, the scapula muscle strength of subjects with neck pain were significantly weaker on the affected side of neck pain as compared to asymptomatic group. These changes in scapular kinematics can also be associated to altered serratus anterior muscle recruitment pattern also, muscle performance such as force imbalance in the upper and lower trapezius muscle,and flexibility deficits in the anatomical location surrounding the scapula which may restrict normal scapular movement during daily activity.[23-26] Movement pattern correction plays a vital role of muscle-recruiting strategies in rehabilitation.

Recovering the normal activation of the serratus anterior and trapezius muscles is essential for neck and shoulder disorder rehabilitation.[27] Proper firing patterns and recruitment of muscles require coupling of the serratus anterior muscle with the upper, middle, and lower trapezius muscles, consequently resulting in "force couples," which are considered necessary fornormal scapular orientation.[28, 29]Previous study have shown that the main goal was to inhibit the over activity of muscle and to facilitate the muscle with weak activity for postural control.[27]

Thus, the early diagnosis of scapula muscle involvement in neck pain in housemaids will help in planning effective interventions which can help the housemaids with limitations faced in their work activities.

Conclusion

The study demonstrates statistically significant weakness of scapula muscle strength with neck pain in housemaids as compared to asymptomatic groups. This gives us an insight into significance of scapula muscle strength in neck pain cases which will help us in formulating effective treatment strategies for treating neck pain cases.

Effectiveness of Piriformis Stretching and Intermittent Lumbar Traction along with Spinal Extension Exercises in Lumbar Disc Herniation: Comparative Study

Rituraj Verma[1], Taruna Verma[2], Vikas Sharma[3], Yash Pratap[4], Sanghamitra Jena[5], Sajjad Alam[6]

[1]Associate Prof., HOD Physiotherapy dept, Galgotias University, [2]Assistant Prof., Galgotias University, [3]Assistant Prof., Galgotias University, [4]Associate Prof., Galgotias University, [5]Assistant Prof., Galgotias University, [6]Associate Prof., Galgotias University

Abstract

Objective: To compare the effect of Piriformis Stretching and Intermittent Lumbar Traction along with Spinal Extension Exercises in Lumbar Disc Herniation.

Sample: Total 30 subjects were taken for the study.

Design: Pre-test & post-test design.

Method: 30 subjects fulfilling selection criteria participated in the study. All of them were told about the procedure of study. All their queries were answered satisfactorily, and informed consent was taken from them. Intermittent lumbar traction, piriformis stretching, and spinal extension exercises were given to the participants. In the beginning of treatment, they were given VAS, Roland- Morris Low Back Pain and Disability Questionnaire and Oswestry Low Back Pain Disability Questionnaire. They were asked to fill these questionnaires. After 1 week protocol of treatment they were again told to fill these outcome measures. The participants were selected for the inclusion and exclusion criteria of the study. The patient consent was taken to be comfortable and relaxed.

Conclusion: Study suggests that Piriformis Stretching along with Spinal Extension Exercises plays a significant role in reducing pain and disability as compared to traction along with Spinal Extension Exercises. By using Piriformis Stretching, in a short period of time, patients are able to carry out functions of daily living smoothly.

Keywords: *Pain, Disability, Lumbar disc herniation (LDH), tumor necrosis factor (TNF).*

Introduction

Herniated disc is a musculoskeletal disorder responsible for sciatica and occurs due to rupture of the annulus fibrosus, following the displacement of the central mass of the intervertebral disc into thedorsalordorso-lateraldiscspaces[1]. Lumbar disc herniations are believed to result from annular degeneration that leads to a weakening of the annulus fibrosus, leaving the disc susceptible to annular fissuring and tearing[2.] Lumbar disc resolves their symptoms without substantial medical intervention[3]. It mainly affects individual between 30 & 50 years of age[4]. Furthermore, the complete natural history oft his disorder is inadequately described, although a variety of anecdotal as well as level 4-5 evidence exists, suggesting that 90% of been estimated to be attack is 37 and in76% of cases there is prior history of low back pain within the previous ten years[5]. Lumbar disc herniation is a common condition that frequently affects the spine in young and middle age patient[6].

Symptomatic herniation of the nucleus pulposus in the lumbar spine affects 1%-2% of the general population sometime during their lives[7]. Symptomatic herniation of the nucleus pulposus is most prevalent in men during the fourth and fifth decades of life[8]. Although the majority of disc herniations occur at the L2-L3, L4/5 or L5/S1 level[9]. The majority of spinal disc herniation cases occur in the lumbar region (95% in L4- L5 orL5-S1)[10].

Methodology: A total number of 30 subjects were included fort he study, who fulfilling inclusion and exclusion criteria volunteered to take part in the study. Subjects were recruited from Divine Physiotherapy Clinic, Vasundhara, consent statement was taken from the subjects to be apart of the study. The Demographic data of the subjects were analyzed by pre-post paired, unpaired t-test, by using SPSS14.

Inclusion Criteria: Both males and females of age group 35-45 years**,** both males and females having Lumbar disc herniation (L4-L5 level), Low back pain involving lower extremities, Sciatica.

Exclusion Criteria: Mentally challenged**,** Pregnancy**,** Children and old age people**,** Congenital pathology of lumbar spine, Surgery of lumbar spine, Infectious disease, Cervical and thoracic herniated disc

Outcome Measures: 1) Visual Analogue Scale, 0-10 grades 2) The Roland - Morris Low Back Pain and Disability, having 24 Questionnaire 3) Oswestry Low Back Pain Disability having 10 statement Questionnaire, includes, pain intensity, personal care (washing, dressing etc.), lifting, walking, sitting, standing, sleeping, sex life, social life and travelling.

Methodology

30 subjects fulfilling selection criteria participated in the study. All of them were told about the procedure of study. All their queries were answered satisfactorily, and informed consent was taken from them. Intermittent lumbar traction, piriformis stretching, and spinal extension exercises were given to the participants. In the beginning of treatment, they were given VAS, Roland-Morris Low Back Pain and Disability Questionnaire and Oswestry Low Back Pain Disability Questionnaire. They were asked to fill these questionnaires. After 1-week protocol of treatment they were again told to fill these outcome measures. Data was collected in the data collection form. All the patients were asked to perform spinal extension exercises (dog-bird,Cat- cow, Half cobra) 10 second hold and 10 repetitions once a day for one week. Intermittent lumbar traction was given to 15 subjects for 15 minutes once a day for one week, Piriformis stretching were given to another 15 subjects with 30 second hold and 4 repetitions once a day for oneweek.

Data Analysis: To analyze the effect of Piriformis Stretching and Intermittent Lumbar Traction on total 30 (15 PS and 15 ILT) subjects, post scores & post-post scores of pain were analyzed by using Mean, Standard Deviation and t-test. Paired t- test was used to find out any significant differences between pre-post test and unpaired t-test was used between post-post test of pain to assess which intervention significantly reduce the pain for assigned duration and frequency.

Comparision of Visual Analogue Scale (Piriformis Stretching) between Pre and Post Test:

Variable	Group	Treatment	N	Mean	S. D.	Standard Error Mean	D.F	t-value
Visual Analogue Scale	Pre-Test	Piriformis Stretching	15	7.26	.59	.15	14	15.19*
	Post-Test		15	2.86	1.06	.27		

*Significant at 0.01 level df = 14, At 0.01 t-value of the Table is 2.97

Comparision of Visual Analogue Scale (Intermittent Lumbar Traction) between Pre and Post Test:

Variable	Group	Treatment	N	Mean	S.D.	Standard Error Mean	DF	t-value
Visual Analogue Scale	Pre-Test	Intermittent Lumbar Traction	15	7.26	.88	.22	14	12.58*
	Post-Test		15	4.46	.91	.23		

*Significant at 0.01 level df =14, At 0.01 t-value of the Table is 2.97

Comparision of Visual Analogue Scale between Post Test (Piriformis Stretching) and Post Test (Intermittent Lumbar Traction):

Variable	Group	Treatment	N	Mean	S. D.	Standard Error Mean	D.F.	t-value
Visual Analogue Scale	Post-Test	Piriformis Stretching	15	2.86	1.06	.27	28	4.42*
	Post-Test	Intermittent Lumbar Traction	15	4.46	.91	.23		

*Significant at 0.01 level df =28, At 0.01 t-value of the Table is 2.76

Comparision of Oswestry between Post Test Piriformis Stretching) and Post Test (Intermittent Lumbartraction):

Variable	Group	Treatment	N	Mean	S. D.	Standard Error Mean	D.F	t-value
Oswestry	Post-Test	Piriformis Stretching	15	29.68	8.39	2.16	28	1.57**
	Post-Test	Intermittent Lumbar Traction	15	35.65	12.07	3.11		

** Not Significant at 0.01 level df =28, At 0.01 t-value of the Table is 2.76

Comparision of Roland Morris Back Pain and Disability (Intermittent Lumbar Traction) Pre and Posttest:

Variable	Group	Treatment	N	Mean	S. D.	Standard Error Mean	DF	t-value
Roland Morris Back Pain and Disability	Pre-Test	Intermittent Lumbar Traction	15	19.46	2.89	.74	14	16.65*
	Post-Test		15	9.60	1.29	.33		

*Significant at 0.01 level df =14, At 0.01 t-value of the Table is 2.97

Comparision of Roland Morris Back Pain and Disability between Post Test (Piriformis Stretching) and Post Test (Intermittent Lumbar Traction):

Variable	Group	Treatment	N	Mean	S. D.	Standard Error Mean	D.F	t-value
Roland Morris Back Pain and Disability	Post-Test	Piriformis Stretching	15	5.00	2.00	.51	28	7.47*
	Post-Test	Intermittent Lumbar Traction	15	9.60	1.29	.33		

*Significant at 0.01 level df =28, At 0.01 t-value of the Table is 2.76

Result

The results of this study support that Piriformis stretching will be more effective and significant in reducing pain and disability (due to LDH) than Intermittent Lumbar Traction.

Future Scope and Research: Present study was limited to 35-45 age group. Further research examining the effects of both PS and ILT on individuals in younger and older age groups would be of interest. Future research must include a follow-up of at least 15 days/16 days to check the short term/long term effects of PS and ILT.

Conclusion

Study suggests that Piriformis Stretching along with Spinal Extension Exercises plays a significant role in reducing pain and disability as compared to traction along with Spinal Extension Exercises.

Ethical Clearance: Prior Patient consent form was taken.

Cassava Leaves Extract *(Manihot esculenta*) Prevents the Decrease of Albumin Serum Level in Mice with Gentamicin-Induced Hepatotoxicity

Rosita Dewi[1], Rena Normasari[2]

[1]Lecturer, Histology Department, Faculty of Medicine, University of Jember, [2]Lecturer, Pathology Anatomy Department, Faculty of Medicine, University of Jember, Jalan Kalimantan No. 37 Kampus Tegalboto, Jember, 6812, East Java, Indonesia

Abstract

Gentamicin is effectively used for the treatment of gram-negative bacterial infection but it has a hepatotoxic effect. Lipid peroxidation and suppression of endogenous antioxidants by gentamicin increases the production of reactive oxygen species which leading to necrosis ofhepatocyte. Cassava leaves *(Manihot esculenta)* contain phenolic compounds, flavonoids, vitamin C, carotene, and iron which act as antioxidant and enzymatic antioxidant cofactor which can inhibit lipid peroxidation. This research aimed to determine the influence of cassava leaves extract to serum albumin level in mice with gentamicin-induced hepatotoxicity. Mice were divided into groups N, K (gentamicin 80 mg/kg b.w.); P1, P2, P3 (gentamicin 80 mg/kg b.w. and cassava leaves extract 150 mg/kg b.w., 300 mg/kg b.w., 450 mg/kg of b.w. for 14 days). Serum albumin level in group K was decreased compared to group N; group P1, P2, P3 were respectively gradually increased. One Way Anova analysis showed significant difference among groups ($p<0.05$). Post Hoc Tukey test showed that serum albumin level in group P3 was significantly different from group K ($p<0.05$). It can be concluded that cassava leaves extract prevent the decrease of serum albumin level in mice with gentamicin-induced hepatotoxicity.

Keywords: *Cassava leaves, hepatotoxicity, gentamicin, albumin.*

Introduction

Liver is the largest organ in the body that plays an important role in the metabolism and detoxification of various types of chemicals [1–4]. Related to this function, liver cells are very susceptible to damage. The level of liver cell damage depends on the type, dose, and duration of exposure to chemicals[5]. Chemicals such as drugs can induce liver damage[6]. The pathogenesis of liver damage involves inhibition of the mitochondrial respiration chain which will increase the number of reactive oxygen species (ROS) and decrease the amount of adenosine triphosphate (ATP). Generation of ROS and ATP depletion triggers intracellular damage, inflammation, and death of liver cells through the necrosis pathway[6–8]. Laboratory tests to support the diagnosis of liver damage include liver enzymes, namely increased alanine transaminase (ALT) and aspartate transaminase (AST), increased bilirubin, and decreased albumin; examinations of liver imaging include ultrasound, CT-scan, MRI; and liver biopsy [6,9]. Albumin level can be used as a predictor of prognosis for liver damage[10].

A six-year study in Denmark reported that six patients underwent liver transplants and nine patients died of liver damage with the etiology of antibiotic use[10]. A 16-year Cohort study in Italy stated that 23.4% of liver damage was caused by antibiotics [9]. In the United States (US), 50% of 1600-2000 cases of acute liver failure per year are caused by drugs and 30% of patients who

Corresponding Author:
Rosita Dewi
Histology Department, Faculty of Medicine, University of Jember
e-mail: rosita.fk@unej.ac.id

undergo liver transplantation die[6]. Another study in the US stated the incidence of acute drug-induced liver failure 0.59 per 1,000,000 population with antibiotics as the second highest etiology[10].

Gentamicin which is used in the treatment of severe infections by gram-negative bacteria in the US is the cause of hepatotoxicity[11]. The nephrotoxic and ototoxic effects of gentamicin have been extensively studied, while the hepatotoxic effects have not been extensively studied. Structural damage and similar declines in liver function were reported due to gentamicin 80 mg/kg b.w. for 7 days [12]. Lipid peroxidation by gentamicin will cause cell membrane damage which will result in cell necrosis. The effect of gentamicin suppression on endogenous enzymatic and nonenzymatic antioxidants will increase the production of reactive oxygen species (ROS) which not only damage lipid membranes but also proteins and nucleic acids.[2,3,11].

Plants are widely used as a source of natural antioxidants that are safe and effective[2,3].One example of food plants widely processed and consumed in Indonesia and contain high antioxidants is cassava (Manihot esculenta). The part that is used as a source of antioxidants is the leaves. Cassava leaves contain phenolic phytochemical components, flavonoids, vitamin C, carotene, and iron as enzymatic antioxidant cofactors[13–16]. In addition, chlorophyll in cassava leaves also acts as an antioxidant which is a major barrier to oxidation reactions [17]. The content of vitamin C in cassava leaves almost reaches four times the content of vitamin C in cassava tubers, while the carotene content is only found in cassava leaves [16,18].

Antioxidant compounds in cassava leaves can provide electrons to free radicals which can inhibit chain reactions and stabilize free radical components [13,14,16]. Therefore, administration of cassava leaves extract is expected to prevent liver damage caused by oxidative stress by gentamicin. If the liver damage can be prevented, the function of the liver in synthesizing albumin will not be disrupted. The effect of cassava leaves extract on serum albumin level in cases of hepatotoxicity has not been studied. Therefore, the authors will examine whether cassava leaves extract can prevent the decrease of serum albumin level in mice with gentamicin-induced hepatotoxicity.

Materials and Method

Cassava leaves used in this study were from Jember, Indonesia. Cassava leaves were washed and dried in the sun. Simplisia dried leaves were mashed using a blender and then sieved until a fine powder is obtained which was then macerated using 70% ethanol solvent. Maceration results were processed into extracts using a rotary evaporator.

This study used a post test only control group design. As research subjects, 25 male mice *(Mus musculus)* aged 2-3 months and body weight ±20 grams were divided into five random groups consisting of normal (N), control (K) with 80 mg gentamicin/kg b.w., treatment group 1 (P1) with gentamicin 80 mg/kg b.w. and cassava leaves extract 150 mg/kg b.w., treatment group 2 (P2) with gentamicin 80 mg/kg b.w. and cassava leavesextract 300 mg/kg b.w., and treatment group 3 (P3) with gentamicin 80 mg/kg b.w. and cassava leaves extract 450 mg/kg b.w. Gentamicin wasperitoneally injectedand cassava leaves were orally (p.o.) administered to the mice every day for 14 days.

The serum albumin level of mice was measured using the photometric method with a wavelength of 546 nm (DiaSys Diagnostic Systems). Data on serum albumin level of mice were analyzed using One Way Anova statistical test with a confidence level of 95%. Differences between groups were analyzed using the Post Hoc Tukey HSD test and the strength of the correlation between the dose of cassava leavesextract and serum albumin level of mice was analyzed using the Pearson correlation test.

Results

The serum albumin level of mice in the K group decreased compared to group N and the serum albumin levels of mice in the P1, P2, and P3 groups increased respectively (Figure 1). Analysis using the One Way Anova statistical test showed a significance value of 0,000 which meant that there were significant differences among groups. In the Post Hoc Tukey HSD statistical test, it can be seen differences between groups. Serum albumin level of mice between group N and group K showed sig. 0,000 which meant that administration of gentamicin 80 mg/kg b.w. for 14 days significantly decreases serum albumin level in mice. Serum albumin level of mice between groups K and P1 and groups K and P2 did not show significant differences (sig. 0.222 and 0.076). Cassava leaves extract 150 mg/kg b.w. and 300 mg/kg b.w. for 14 days prevent the decrease of serum albumin level in mice but not significant. Significant

differences were found between groups K and P3 (sig. 0.016) which meant that the administration of cassava leaves extract 450 mg/kg b.w. for 14 days could prevent significant the decrease of serum albumin level in mice. However, serum albumin level of mice between groups P2 and N and groups P3 and N did not show significant differences (sig. 0.051 and 0.208). Pearson correlation test resulted an R value of 0.627.

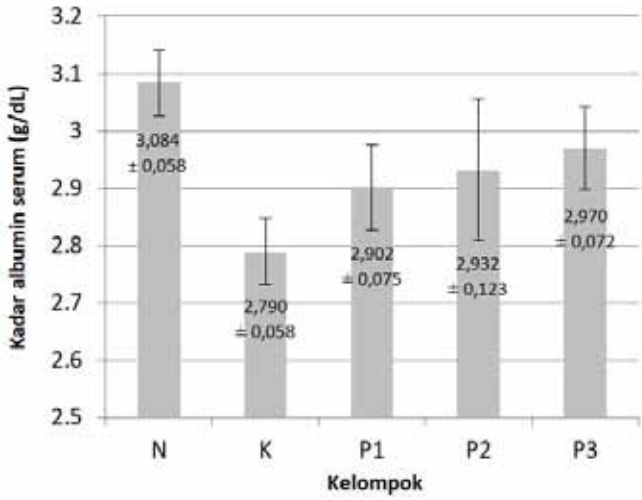

Figure 1. Mice serum albumin levels

N: normal group, K: control group (gentamicin 80 mg/kg b.w. i.p. for 14 days), P1: treatment group 1 (gentamicin 80 mg/kg b.w. i.p. and cassava leaves extract 150 mg/kg b.w. p.o. for 14 days), P2: treatment group 2 (gentamicin 80 mg/kg b.w. i.p. and cassava leaves extract 300 mg/kg b.w. p.o. 14 days), P3: treatment group 3 (gentamicin 80 mg/kg b.w. i.p. and cassava leaves extract 450 mg/kg b.w. p.o. for 14 days).

Discussion

Administration of gentamicin at dose of 80 mg/kg b.w. i.p. for 14 days reduced serum albumin level in mice ($p < 0.05$). In another study, administration of gentamicin 100 mg/kg b.w. every other days for 21 days also significantly reduced rat albumin level[3]. Albumin is a protein found in the highest amount in plasma. Albumin plays an important role in maintaining plasma osmotic pressure and acts as an endogenous and exogenous transporter[19]. Albumin is synthesized by the liver and excreted rapidly into the circulatory system so that if there is a liver injury, its level in the blood will decrease[4,19].Increased intracellular enzymes of ALT and AST liver and albumin depletion reflect liver or hepatocyte damage [3].

In this study, decreased albumin levelwas caused by gentamicin-induced hepatotoxicity. In previous studies, the average score of hepatocyte damage in the gentamicin-induced mice group showed significant differences with the normal mice group ($p<0.05$). The results of liver microscopic observations due to gentamicin induction are parenchymal degeneration, hydrophic degeneration, and necrosis[20]. The characteristics of hepatocytes undergoing parenchymous degeneration are swollen cells, cloudy cytoplasm and granular; characteristics of hepatocytes undergoing hydrophic degeneration are visible vacuoles in the cytoplasm and pale cytoplasm; the characteristics of hepatocytes undergoing necrosis are shrinking cell nuclei (picnosis), cell nuclei breaking into fragments (karyokinesis), lysis cell nuclei (karyolysis), and lysis cell membranes[5,8,21]. Hepatocyte necrosis is classified as zonal necrosis which is generally found in zone 3 and can also be found in zone 1[22,23]. In another study, administration of gentamicin 80 mg/kg b.w. for seven days showed hepatocyte necrosis, widening of sinusoids, vacuole formation in hepatocytes, and leukocyte infiltration[12].

Gentamicin use slightly above the therapeutic dose has the potential to cause hepatotoxicity. About 5-10% of patients treated with gentamicin have liver damage[12]. Many studies have examined the effect of gentamicin on

changes in levels of intracellular antioxidant enzymes such as superoxide dismutase (SOD), glutathione (GSH), and catalase and changes in level of lipid peroxidation products such as malondialdehyde (MDA). Administration of gentamicin 100 mg/kg b.w. i.p. every other days for 21 days significantly reduced SOD and GSH levels and increased MDA level in rat liver [3]; gentamicin 100 mg/kg b.w. i.p. for seven days decreased GSH level and significantly increased MDA level in rat liver[11];gentamicin 100 mg/kg b.w. i.p. for three days significantly reduced levels of GSH, SOD, and liver catalase in mice[1];gentamicin 40 mg/kg b.w. i.p. for seven days can significantly reduce GSH and increase MDA in rat liver [2].

Cassava leaves are used as a source of natural antioxidants that can provide protection against cells from the influence of free radicals. The leaves contain carotene which is the most active provitamin A and high in vitamin C (7052 µg carotene and 130 mg of vitamin C every 100 grams)[15,18,25]. Carotene and vitamin C are classified as exogenous non-enzymatic secondary antioxidants that can capture free radicals and prevent chain reactions in lipid peroxidation [15,16,26,27]. Antioxidant compounds provide electrons to free radical molecules resulting them as stable molecules [13,14].

A study analyzing the phytochemical components of methanol extract and water extracts of boiled cassava leaves and simplicia showed the presence of flavonoids and phenolic compounds in cassava leaves. These compounds are also classified as secondary antioxidants. Flavonoids are polyphenol compounds with phenolic hydroxyl groups that make them have antioxidant activity by inhibiting the activity of superoxide anions, lipid peroxide radicals, and hydroxyl radicals [16,26,27].As the leaves grow older, the flavonoid levels increase[17]. Cassava leaves extract used in this study was not processed by boiling. Processing cassava leaves by boiling reduces levels of phenolic compounds and flavonoids by 30%. Phenolic and flavonoid compounds are unstable so that they are easily damaged by heating during the boiling process[13]. In addition, the carotene can also be damaged by heating [25].Plants with green leaves contain iron which can act as a co-factor of intracellular antioxidant enzymes, namely catalase which functions as a catalyst for the chemical reaction of hydrogen peroxide into water [14,26,28].Chlorophyll in cassava leaves is also a major barrier to oxidation reactions. Chlorophyll level will increase with increasing time until the leaves develop fully and then decrease in old leaves[17].

The serum albumin level of mice in the group administered gentamicin and cassava leaves extract 450 mg/kg b.w. were significantly different compared to the group of mice that were administered gentamicin without cassava leaves extract. However, serum albumin level of mice in the group that was administered cassava leaves extract 300 mg/kg b.w.was not different from the normal group. This indicated that cassava leaves extract 300 mg/kg b.w.could prevent the decrease of serum albumin level so that it wasequal to normal serum albumin level.R value of 0.627 (0.6- <0.8) in the Pearson correlation test showed a strong correlation between the dose of cassava leavesextract and serum albumin level in mice. A positive R value means that the dose of cassava leavesextract and serum albumin level of mice are directly proportional. The higher the dose of cassava leaves extract, the higher the serum albumin level of mice[29].

Conclusion

From the results of this study, it can be concluded that cassava leaves extract prevents the decrease of serum albumin level in mice with gentamicin-induced hepatotoxicity.

Common Warts Treatment by Intralesional (60,000 Versus 120,000) IU of Vitamin D3, Comparative Study

Ruya Thamer Ihsan Mahmoud[1], Mazin Hamid Ayyash[2]

[1]Scholar Researcher, M.B.Ch.B., Kirkuk University 2010-2011,
[2]Assistant Professor, FICMS, Higher Diploma in Laser, College of Medicine, Tikrit University

Abstract

Background: Wart is common disease cause by infection with HPV, there are many modalities for treatment most of them resolve wart with many side effects as scars and recurrence.

Objective: To identify the significant difference between two doses of intralesional vitamin D3 (60,000 vs 120,000) iu injection in treatment of warts.

Patients and Method: A total of 47 patients were included in the study divided into two groups. Group A received intralesional 60,000 iu of vt.D3, and group B received intralesional 120,000 iu vt. D3 into each lesion with maximum of five warts treated in one session. Four sessions was done every 2 weeks in both groups. Follow-up was done for 4 months after last session of treatment for any recurrence.

Results: In group A: complete response in 77.7%, partial response in 6.67%, minimal response in 6.67%, and no response in 6.67% of patients. About 60% of patients with multiple warts showed complete clearance of distant untreated warts. In group B: complete response in 66.7%, partial response in 6.67%, minimal response in 20%, and no response in 6.67% of patients. There was no significant difference between both groups. No recurrence was observed in both groups in the follow-up period.

Conclusions: Immunotherapy by both intralesional MMR vaccine and vitamin D3 is simple, well-tolerated, and effective.

Keywords: *HPV, treatment, vitamin D3, warts.*

Introduction

Wart: are benign cutaneous tumor and less commonly occur mucous membrane and caused by Human papilloma viruses (HPVs).

Common warts are hyperkeratotic, exophytic, dome-shaped papules or plaques that are commonly associated with HPV-1, -2, -4, -27, or -57. spontaneous resolution may occur within 2 years in 65%–78% of warts, for most patients. [1]

It replicates simultaneously with differentiation of keratinocytes, leading to the maturation of viral particles in the granular cell layer. The viral particles are released at same time with exfoliation of the verruca, causing spread to other regions.[3]

There is no viremic phase during the life cycle, therefore a systemic immune response is avoided. In addition, small amount of viral proteins is expressed in the basal and spinous cell layers of the epidermis, where they would be most likely to be recognized by Langerhans cells and infiltrating lymphocytes.]2]

Clinical types of warts;Verruca vulgaris, Palmoplantar warts, Verruca plana, Filiform warts,Periungual wart,Mucosal wart.Diagnosis:warts are usually diagnosed clinically; Characteristic warty appearance with a rough, dry stippled surface, paring the surface of the wart will reveal capillary loops close to the surface and often causes bleeding.[4]

Treatment Involved: First line; Salicylic acid, Glutaraldehyde, Formalin, Occlusion,Topical 5-fluorouracil, Caustics, Retinoic acid, Vitamin D analogues

Second line; Cryotherapy, Laser, Hyperthermia, Surgery, Photodynamic therapy

Third line; Podophyllin and podophyllotoxin, Imiquimod, Topical immunotherapy, Intralesional immunotherapy,Interferon, H2 receptor antagonists, Zinc,Oral retinoids, Intralesional bleomycin, Cidofovir, Psychological method.

Vitamin D; It is a group of fat-soluble secosteroids responsible for enhancing intestinal absorption of calcium, magnesium, and phosphate, and has multiple other biological effects. [1] In humans, the important compounds in this group are vitamin D3 (also known as cholecalciferol) and vitamin D2 (ergocalciferol). [7]

The Mechanism of Action of Vitamin D3 Analogues

Cells in the skin have receptors for Vitamin D3 analogues are keratinocytes, Langerhans' cells, melanocytes, fibroblasts and endothelial cell [6], so

1. It works through Vitamin D receptor (VDR) to regulate cell growth, differentiation and immune function. It inhibits the proliferation of keratinocytes and modulates epidermal differentiation
2. Vitamin D prevent production of several pro-inflammatory cytokines by T-cell clones, including IL-2 and IFN-γ.
3. It inhibits interleukin-6 (from B cell) and interleukin-8 (that produced from macrophage).
4. It inhibits transcription of granulocyte-macrophage colony-stimulating factor and messenger ribonucleic acid.
5. It block activity of cytotoxic T cells and Natural Killer cells.[8]

Patient and Method

The study was conducted in the departments of dermatology of Salahuldin-General Hospital in Tikrit city and Azadi Teaching Hospital in Kirkuk city, Iraq. From Nov. 2019 to 30 June 2020. It was an opened, a comparative and a therapeutic trial study to estimate the efficacy of the vit. D3 in different two doses to treat wart. A total of 47 patients were enrolled in the study. 27 of them treated with 60,000 IU of vit. D3 as group (**A**) and other 20 patient treated with 120,000 IU of vit. D3 as group (**B**). The study targeted male and female from 9 to 60 years old. Exclusion criteria involved Immunosuppressed patient. Pregnant women's. Lactating women's. Patient on other treatments modalities of wart in previous 2 weeks of injection. Prior history of hypersensitivity to vit. D3 .

Clinical Response:

- Clinical response determined by reduce in the number and size of warts.
- Complete response achieve when all of wart included (treated warts and distant warts) resolved completely 100%.
- Moderate response achieve when >50% to <100% reduce in both size and number of lesion.
- Mild response achieve when 1% to<50% of reduction occur. [5]

Materials

- 27 gauge insulin syringe.
- vit. D3 ampule 300,000 IU/ml.

Method of Administration of Vitamin D3 Injection:

We give slow gentl intralesional injection of vitamin D3 without local anaesthesia after proper encourgement and reasurance to the patients.

- Patients in group 1 A (no. = 27) were treated with 60,000 IU vit. D3 (0.2ml of 1ml of vit. D3 300,000 IU) whereas group 2 B (no. = 20) were treated with 120,000 IU vit. D3 (0.4ml of 1ml of vit. D3 300,000iu), vit. D3 injected to the base of wart with 27 gauge insulin syringe (Figure 18).
- The injections were repeated 2weeks apart; for 4 sessions.
- The large number of wart treated in single session were 5 warts.
- Follow up of recurrence will obtained after 4 months of last injection.

Results

Demographics and clinical informations of the patients in each groups were mentioned in table 1 with no statistically significant difference between both groups.

Data	Group A (no.=27)	Group B (no.=20)	P. value t. Test
Dose of vt.D3	60,000iu	120,000iu	
Sex Male Female Ratio: F:M	 9 (33.3%) 18 (66.6%) Ratio 2:1	 9 (45%) 11 (55%) Ratio: 1.2:1	
Age (years) <25 >25 Min-Max Mean± SD Median	 19 (70%) 8 (29.6%) 3 - 48 19.3 ± 12.6 18	 16 (80%) (20%) 8 - 50 20 ± 10.5 19	
Previous Treatment No Yes	 15 (55.5%) 12 (44.4%)	 11 (55%) 9 (45%)	
No. of wart Single Multiple	 9 (33%) 18 (66.6%)	 11 (55%) 9 (45%)	
Maximum diameter of treated wart	40 mm	35 mm	
Mean of diameter before treatment	10.7 mm	16.9 mm	
Mean of diameter after treatment	1.18 mm	4.9 mm	
Duration in months Min-Max Mean± SD Median	 2 - 36 11.2 ± 10.5 6	 3 - 24 12.65 ± 8.5 12	
Rate of complete response	21 (77.7%)	11 (55%)	P. Value = 0.20 t. Test= 1.475743
Type of wart Verruca vulgaris Periungual Filiform	 21 (77.7%) 6 (22.2%) 0 (0%)	 17 (85%) 1 (5%) 2 (10%)	P. Value = 0.214
Side effect of vt.D3 injection Yes No	 15 (55.5%) 12 (44.5%)	 17 (85%) 3 (15%)	
Relapse	1 (4.7 %)	0 (0%)	

Regarding to the response of wart to treatment (table 1) show that group **A** has 77.7% complete response, 14.8% moderate response and 7.4% mild response (2 patients of 27 while in group **B** has 55% complete response, 35% moderate response and 10% mild response with no significant difference between groups (*p value* =0.3130).

Relationship between clinical response and numbers of sessions shown in table 2, group **A** there's 6 patients (28.5%) of patients have complete response after 2 sessions figure 1,9 patients (42.8%) show complete response after 3 sessions and 6 patients (28.5%) show complete response after 4 sessions while others show partial response after 4 sessions. In group B there's 5 patients (45.5%) show complete response after 2 sessions figure 2, 4 patients (36.5%) show complete response after 3 sessions and 2 patients (18.2%) show complete response after 4 sessions while other patients have partial response after 4 sessions. No significant difference between groups (*p value =0.879).*

Table 2: Relationship between complete response and number of sessions.

No. of sessions	Group A No.=21	Group B No.=11	p. value
2	6 (28.5%)	5 (45.5%)	0.879
3	(42.8%)	4 (36.6%)	
4	6 (28.5%)	2 (18.2)	

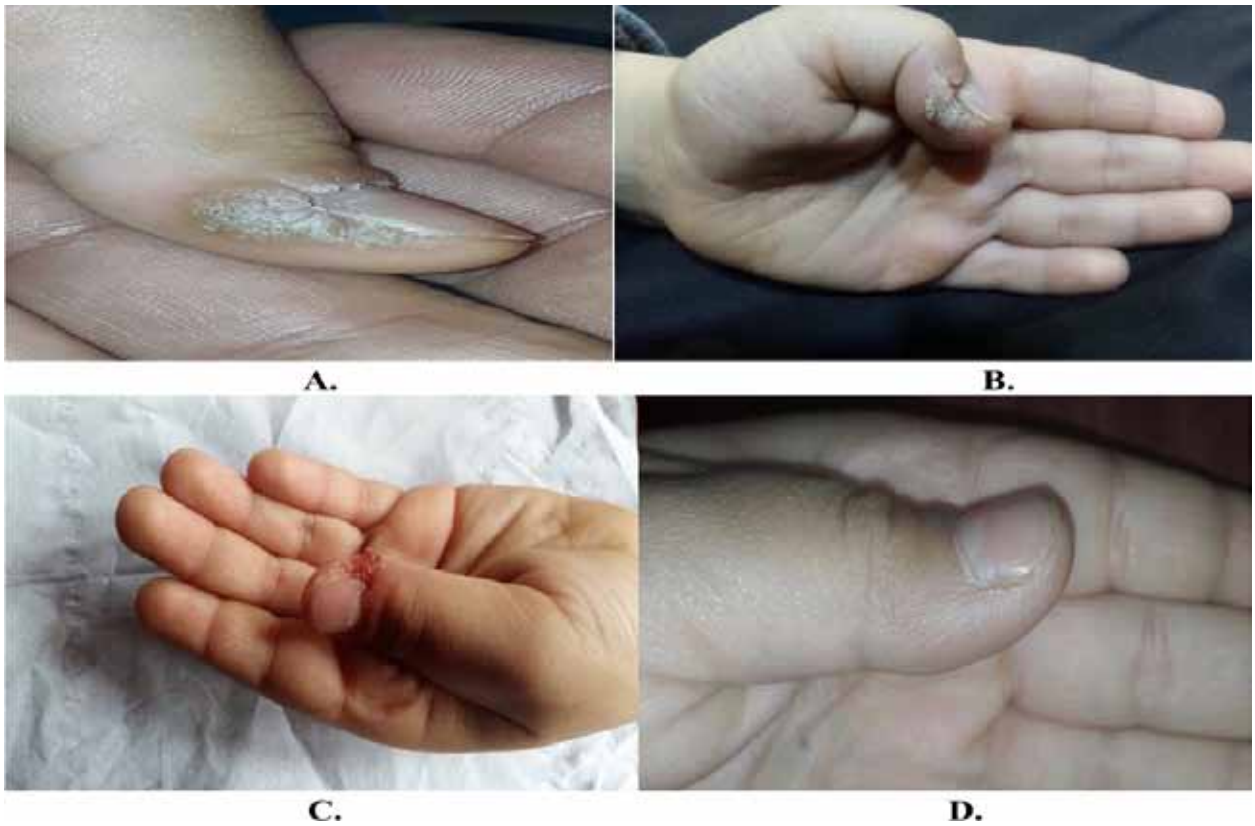

Figure 1: Periungual wart for 11 years old boy since 1 year durations (A) before treatment, (B) after 2 weeks of treatment, (C) after 2 sessions, and (D) complete response after 3 sessions of treatments with vt.D3 60.000 IU.

Figure 2: Filiform wart on upper lips of 19 years old man for 5 months duration (A) before treatment, (B) after 2 weeks of 1st session, and (C) after the second session of treatment with vt. D3 120,000 IU.

Regarding reduction of the diameter of the wart (table 3), in group **A** the total diameter before treatment was 289mm reduced to 32mm there's significant difference (*p =0.004428),* while in group B the total diameter of wart before treatment was 337mm reduced to 97mm after treatment also there's significant difference (*p=0.0000317).* (Figure 33) show mean of diameters in both groups before and after injection.

Table 3: Comparison of clinical response regarding diameter of wart in both groups.

Status of wart Diameters	Group A	Group B
Before Mean ± SD	289 mm 11± 9.3	337 mm 17 ±10.8
After Mean ± SD	32 mm 1± 2.7	97 mm 5 ± 7
P value	0.004428	0.0000317

Regarding to sides effect table 4 show in group **A** 15 patients (55.5%) developed sides effect including erythema, pain, swelling and itching at site of injection with one patient developed pustule at site of injection.

In group **B** 17 patients (85%) developed the same sides effect at site of injection with one patient developed vasovagal attack after injection immediately and resolved within minutes, other patient developed ulcer at site of injection. (*p= 0.545).*

Table 4: Side effects incidence in both groups.

Side effects	Group A (No.=27)	Group B (No.=20)	P value
Negative	12 (44.4%)	3 (15%)	0.545
Positive	15 (55.5%)	17 (85%)	
Erythema	2 (13.3%)	2 (11.7%)	
Pain	1 (6.6%)	1 (5.8%)	
Itching	0 (0%)	2 (11.7%)	
Swelling	2 (13.3%)	0 (0%)	
All of them	10 (66.6%)	12 (70.5%)	

Regarding clearance of distal warts in group A there's one patient with distal wart who has no improvement while in group B there's 5 patients 3 (60%) of them getting improved of distal wart spontaneously with treatment of target wart.

There was no significant relation between clinical response and either age, sex, site of wart, type of wart and duration of disease in each groups.

Discussion

In our study there's 32 from 47 patients with complete clearance 68% and 11 patients with moderate response 23.5% and 4 patients with mild response 8.5%.

Our results match with many studies as:

Shalmoud et al (2020) reported 66.7% of patient's complete response, 6.67% had partial response, 20% had minimal response, and 6.67% had no response. [9]

Raghukumar et al18(2017) reported complete response in 90%, partial response in 6.66%, and no response in 3.33%. [10]

Aktaş *et al* (2016) recorded complete clearance in 70%, 15% had a partial response, and 15% showed no response. [11]

Kavya *et al* (2017)19 study revealed complete clearance in 78.57%, 14.28% had a partial response, and 7.14% showed minimal response. [5]

Regarding to high complete response rate in study of Raghukumar *et al* may related to high dose (600,000 IU) uses.

Also our results match with Chia-Han Yeh M et al (2019) who has fourteen studies with 480 patients in which 59.9% patients (95%CI: 45.5%-72.9%) receiving intralesional vitamin D3 injection achieved complete resolution. [12]

Kareem *et al* (2019) who involved 30 patients as cases group who received intralesional injection of 0.2 mL of vitamin D3 (300,000 IU) into the base of mother wart for two sessions,1 month apart, photographs were taken before injection then after 1 month and 3 months of injection. Complete clearance of the target injected warts occurred in 40% of patients, partial response occurred in 23.3% in patients in cases group; and there was no change in 36.7% of patients. [13]

Relatively there is low rate of complete response in this study which may be due to less numbers of injection with long duration between each session.

El Sayed et al (2020) there's 3 groups of patients group 1 treated with intralesional 2% zinc sulfate, group 2 intralesional 2% vt. D3 and group 3 intralesional normal saline for 4 sessions each 2 weeks the complete response rate with vt. D3 in this study was 62.9% and this rate is relatively similar to our study. [14]

In our study there's no significant difference between group **A** and **B** in clinical response to different doses of vitamin D3 which was in group **A** 21 patients from 27 patients with complete response 77.7% and in group **B** 11 patients from 20 patients with complete clearance 55% (*p value = 0.20)(t test =1.475743),* but there's a significant difference in the reduction of the diameter of the wart which was in group **B** 337mm before treatment and be 93mm with p value *0.0000317* compare to group **A** which was 289mm before treatment and be 32 mm after treatment with p value *0.004428.*

This result refers to ability of 120,000 IU of vitamin **D3** to be superior on 60,000 IU of vitamin **D3** in treatment of wart but the results of nonsignificant difference in other measures between two groups may be due to the larger diameter of the warts in group **B** which may require for more sessions to achieve the better response.

Regarding to the complete response and numbers of sessions it was in group **A** 6 patients (28.5%) after 2 sessions,9 patients (42.8%) show complete response after 3 sessions and 6 patients (28.5%) show complete response after 4 sessions while others show partial response after 4 sessions with no significant difference (*p value = 1)* mean ± SD was 3 ±7.9 .In group **B** there's 5 patients (45.5%) show complete response after 2 sessions, 4 patients (36.5%) show complete response after 3 sessions and 2 patients (18.2%) show complete response after 4 sessions mean±SD was 2.7 ±2, while other patients have partial response after 4 sessions with no significant difference (*p value = 0.121)*.No significant difference between groups (*p value =0.879).*

Regarding clearance of distal warts in group **A** there's one patient with distal wart who has no improvement while in group **B** there's 5 patients 3 (60%) of them getting improved of distal wart spontaneously with treatment of target wart.

Regarding to sides effect in group **A** 15 patients (55.5%) developed sides effect including erythema, pain, swelling and itching at site of injection with one patient developed pustule at site of injection.

In group **B** 17 patients (85%) developed the same sides effect at site of injection with one patient developed vasovagal attack after injection immediately and resolved within minutes, other patient developed ulcer at site of injection and there is no significant difference between two groups (*p= 0.545).*

Regarding to the recurrence of wart after 4 months of last injection for each wart in completely cured patients was one patient in group **A** (4.7%) while no recurrence in group **B**.

There were no significant relation between clinical response and either age, sex, site of wart, type of wart or duration of disease in each groups as in Shalmoud et al.[9]

Abstract

Diabetes mellitus (DM) is a global epidemic that is correlated with long-term damage and causes dysfunction of many organs like the kidney leading to diabetic nephropathy (DN) which need for heamodialysis (HD) to protect progressive renal decline. This study was designed to evaluate the significance of glycated albumin (GA), compared with fasting blood sugar (FBS) and glycated hemoglobin (HbA1c), were evaluated as an indicator of glycemic control, also determinant of insulin. This study was conducted on 95 patients at age rang (30-70) years, and patients include (35) HD patients with diabetes, (35) HD patients without diabetes and (25) Type 2 diabetes mellitus, who attended atRamadi General Hospital and (25) samples as control included in this study. This study showed that HbA1c% was significantly lower than simultaneous FBS and GA% in HD patients in comparison with in diabetic patients and control, as illustrated in significantly shallow slope of regression line between FBS with HbA1c and FBS with GA. Also, GA% was nearly corresponding between before and after one hemodialysis in HD patients compared with HbA1c.In conclusion, GA provides a better measure to estimate glycemic control in HD patients with diabetes compared with HbA1c.

Keywords: *Chronic kidney disease, Diabetes mellitus, Glycated Albumin, HbA1C, Hemodialysis.*

Introduction

Diabetes mellitus (DM) is a metabolic disorder of carbohydrate leading persistent high level of blood glucose due to insufficient amount of insulin. Chronic hyperglycemia is associated with damage and causes dysfunction of several organs such as kidney[1;2]. Chronic kidney disease (CKD) is progressive loss of kidney function over a period of months or years[2]. The single most common of CKD is diabetic nephropathy (DN), which occurs as a result of microangiopathy caused by diabetes and is one of the most important disorders leading to renal failure. Strict glycemic control is beneficial in preventing complications of diabetic nephropathy[3]. Heamodialysis (HD) is successful in prolonging the life of end-stage renal disease (ESRD) patients. Selecting reliable clinical biomarkers to monitor glycemic control is critical in HD patients with diabetes. Glycated hemoglobin (HbA1c) and glycated albumin (GA) are biomarkers used for estimating glycemic control[4]. At present, HbA1c is widely used as a gold standard index for glycemic control in clinical practice. However, the HbA1c levels may be erroneous in patients with CKD because of numerous factors as anemia and the management of erythropoietin (EPO). GA has been developed as an index for glycemic control and it measures specifically the glycation product of albumin. To date, GA has been suggested as a more reliable and sensitive glycemic index to replace HbA1c in diabetic patients with CKD [5], because it is not influenced by anemia and associated treatments[4]. The main aim of this study was assess whether GA might provide a

better indicator than HbA1c for glycemic control in HD patients with diabetes.

Materials and Method

The Specimens collection were started from April, 2019 till end of June 2019. HD patient with diabetes (35) and HD patient without diabetes (35) samples were collected from the Industrial Renal department and T2DM patients (25)from the Diabetes Center for Treatment at Ramadi General Hospital. For the purpose of comparison, (25) samples as control. Before the collection of samples, a careful history was taken from each patient according to a questionnaire. From each patient and control, (5 ml) of blood were obtained by venipuncture. The blood samples were divided into two aliquots; 2ml was dispensed in EDTA tube and used for HbA1c which determination by fast ion-exchange resin separation method for the detection of HbA1c in human blood according to[6], which provided from human company/Germany**.** While 3ml was dispensed in plain tube to collect serum, the serum were used in estimation FBS and GA. FBS determination according to [7]method, which provided with kit from linear company/Spain. **Determination of GAby ELISA:** According to Cat.No:YHB1374method as cited by manufacturing company kit, which provided from Shanghai company/China. This kit uses enzyme-linked immune sorbent assay based on biotin double antibody sandwich technology to assay Human GA. To measure the percent of GA, the conversion formula supplied with kit was applied to all subjects; the formula is GA%= ([GA concentration/Total albumin]/1.14 × 100)+ 2.9.

Statistical: The statistical analyses were carried out using SPSS version 25. One way ANOVA test was used to find means and standard deviation (SD) for all variables of the study. The difference significances in proportions analyzed by LSD test. The correlations between variables were confirmed by Pearson correlation analysis. P-value >0.05 were considered to be significant**.**

Results and Discussion

Variation of FBS Levels during Study Period of 60 day: The results in table (1) corresponds with Inaba *et al*.,[8]who recorded that FBS in HD patients with diabetes for three measures was stale. These results no corresponds with Lin *et al*., [9] who found that the mean FBS levels after the first year of hemodialysis were stable.

Table (1): The mean levels of FBS between the four study groups.

Groups	N	Mean±SD FBS1 (60 day) Before of GA & HbA1C meas.	Mean±SD FBS 2 (30 day) Before of GA & HbA1C meas.	Mean±SD FBS 3 (0 day) at GA & HbA1C meas.	T- test P value
Control	25	89±19	88.4±18.6	88.2±16.3	0.165 ^{NS}
Diabetes	25	218.5±44.6	216.8±46.3	211.8±48.4	0.547 ^{NS}
HD patients with diabetes	35	189.8±58.8	188.5±61.5	187.6±60.8	0.371 ^{NS}
HD patients without diabetes	35	94.8±11.6	92±12.4	90.7±9.6	0.252 ^{NS}
Total	**120**	**148.3±70.7**	**146.2±68.5**	**144.5±68.7**	**0.124** ^{NS}

*NS: Mean non-significant differences at P ≤0.05.

These results suggested that glycemic control of control group and patients groups were stable during the study period (60 days) before determined of GA and HbA1c and a single determination immediately before HD can be indicative of glycemic control in HD diabetes patients. The stable glycemic control during the preceding 2 mo may negate the different impact of acute glycemic control changes between HbA1c and GA in this study. In the first month of hemodialysis, the average FBS levels reflect the initial degree of glycemic control achieved at this stage of hemodialysis therapy. The 3- months FBS levels reflect the long-term glycemic control of hemodialysis therapy and the general condition of the hemodialysis patient at this stage[9].

Determination of Average Fasting Blood Sugar (FBS) Level: Table (2) showed average of FBS was a significant increase in diabetic group (215±11.1)

mg/dl, followed by HD patients with diabetes group (188.7±18.39)mg/dl compared with other groups, while the average of FBS was decreased in control group and HD patients without diabetes were (88.5±4.88 and 92.2±2.7) mg/dl respectively compared with other groups.

Table (2): The mean of average FBS between four study groups.

Groups	N	Mean±SD of Average FBSNV(70-100) mg/dl
Control	25	88.5 ± 4.88[a]
Diabetes	25	215 ± 11.1[b]
HD patients with diabetes	35	188.7 ± 18.39[c]
HD patients without diabetes	35	92.2 ± 2.7[a]
Total	**120**	**146.1 ± 26.36**

*Different Letters (a, b, c): Means significant difference at P ≤0.05.

The results in table (2) agreement with Khalaf, [10]; Abid Hammed, [11]who recorded that the significantly higher in diabetic patients and HD patients with diabetic compared to control, but our results disagreed in another part of study by Abid Hammed, [11] when demonstrated non-significant difference between diabetic patients and HD patients with diabetes. The level of blood glucose normally represents balance between the inflow of glucose into blood and its uptake by the tissue. This result demonstrated an increase in gluconeogenesis in diabetic patients which is the predominant mechanism responsible for increased hepatic glucose output in patients with T2DM and it is correlated with fasting plasma glucose level. The fasting hyperglycemia has been result from an increased rate of glucose production which including increased rate of hepatic glycogenolysis and gluconeogenesis. While in HD patients, FBS affects by dialysis fluid, and changes in glucose levels in the dialysis fluid during and after hemodialysis [10;11].

Determination of Glycoheamoglobin (HbA1): Table (3) showed mean HbA1C was a significantly increased in diabetic patients (10.41±1.16) % compared with other groups, also a significant increase in HD patients with diabetes (8.194±1.22)%. While the mean of HbA1C was decreased in HD patients without diabetes and control were (5±1.23 and 5.31±0.76)% respectively.

Table (3): The mean of HbA1c percent between four study groups.

Groups	N	Mean±SD of HbA1C NV(4.5-6.2)%
Control	25	5.31±0.76[a]
Diabetes	25	10.41±1.16[b]
HD patients with diabetes	35	8.194±1.22[c]
HD patients without diabetes	35	5 ±1.23[d]
Total	**120**	**7.13±1.86**

*Different letters (a, b, c): Means significant difference at P ≤0.05.

The results in table (3) agreed with Hadi and Sultan,[12] who recorded that the HbA1C increased in diabetic patients compared with control. Also agreed with Abid Hammed, [11]who showed that HbA1C was significantly higher among T2DM (10.6±1.6) % and HD patients with diabetes (8.5±1.8) %, compared with control (4.8 ± 0.7)%. The rise in the HbA1c levels was associated with the increasing level of FBS in diabetic groups, indicating that testing of HbA1c appears as a measure of chronic hyperglycemia in diabetic patients.

The HbA1c has been used as an objective marker of average glycemic control because the levels of HbA1c in the blood reflect the glucose levels which erythrocyte has been exposed during its lifetime of the RBC[13].Thus, the elevation of HbA1C levels in our study indicates reduced control of blood glucose levels[10].

Determination of GA: Table (4) showed that the mean GA% was a significantly increased in diabetic patients and HD patients with diabetes were (30.5±4.15 and 29.2±4.5)% respectively, while the mean of GA% was decreased in control (16.1±1.8)% followed by HD patients without diabetes (17±1.12) %.

Table (4): The mean of GA percent between four study groups.

Groups	N	Mean±SD of GA%, NV(>18)%
Control	25	16.1±1.8[a]
Diabetes	25	30.5±4.15[b]
HD patients with diabetes	35	29.2±4.5[b]
HD patients without diabetes	35	17 ±1.12[a]
Total	**120**	**23.78±13.05**

*Different Letters (a, b, c): Means significant difference at P ≤0.05.

Results in table (4) consistent with Lu *et al*.,[3];Chen *et al*., [14] who recorded that mean of GA% increase in HD patients with diabetes compared with HD patients without diabetic and control. And consistent with Fukami *et al*., [15] who recorded that the mean of GA% was increased in diabetes patients compared with control. GA concentrations could accurately reflect the glycaemic control in such patients without being influenced by anaemia and hypoalbuminemia. GA may be desirable in diabetic patients with ESRD complicated with both renal anaemia and hypoalbuminemia. While in HD patients without diabetes, increased GA and impaired renal function should be closely monitored for the development of arterial stiffness [15].

Correlation between FBS with GA% or FBS with HbA1c% in study groups.

There were significant and positive correlations between FBS with GA% (r =0.34, P < 0.01; Figure (1) A1) and (r =0. 371, P < 0.01; Figure (2) A2) or FBS with HbA1c% (r =0.459, P < 0.01; Figure (1) B1) and (r =0.356, P < 0.01; Figure (2) B2) in diabetic patients and HD patients with diabetic respectively. As shown, the correlation between FBS and GA% was similar between HD patients with diabetes and diabetic patients, but FBS and HbA1c% seemed to be significantly lower in HD patients with diabetes than in diabetic patients.

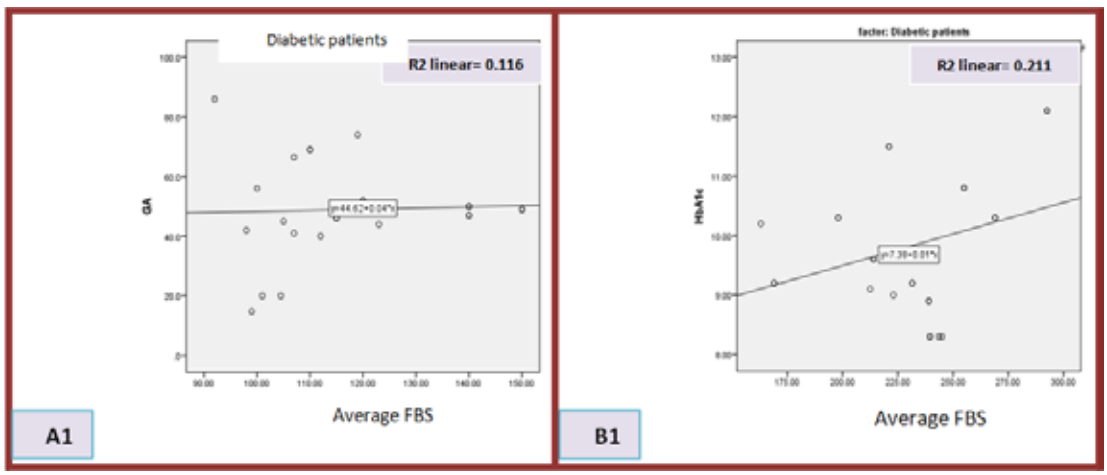

Figure (1):Correlation between average FBS values with GA% (Figure A2) or average FBS values with HbA1c% (Figure B2) in diabetic patients group.

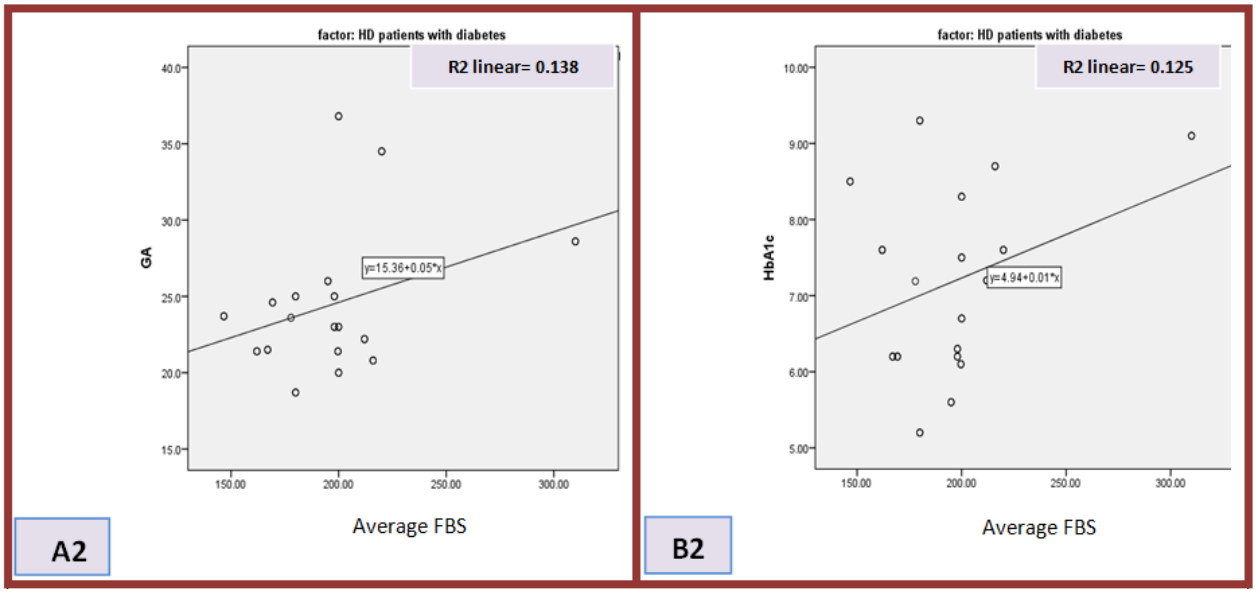

Figure (2): Correlation between the average FBS values with GA % (Figure A3) or average FBS values with HbA1c% (Figure B3) in HD patients with diabetic group.

Effect of a Single HD Session on GA% and HbA1c%: These results show that serum GA% were almost identical between before and after a single HD session in HD patients with diabetes were (29.4±4.71 and 29.3±4.5) respectively. While HbA1c also identical between before and after a single HD but to a lesser degree from GA, where in HD patients with diabetes were (8.5 ±1.83 and 8.19 ±1.2) respectively.

The ratio of GA/HbA1C in study groups: The GA/HbA1c ratio was (3.0) in control groups and (2.93) in diabetic patients with no significant difference between these two groups. Also the GA/HbA1C ratio showed no significant difference between HD patients with diabetes (3.5) and HD patients without diabetes (3.3).

The results in figures (1, 2) identify with the finding of study by Inaba *et al*., [8] who recorded that the significant and positive correlations between average FBS with serum GA. Also identify with Gan *et al*.,[4] who found that GA showed a strong correlation with mean FBS and supply a more reliable marker of glycemic control, compared with HbA1c which showed heterogeneity correlation with average FBS was indicated in HD patients. The results in table (5) agreed with Gan *et al*.,[4] who indicated that the GA is superior to HbA1C in estimating glycemic control in HD patients with diabetes.While GA/HbA1c ratio symmetrical with Inaba *et al*., [8] who recorded that GA/HbA1c ratio was (2.9) in diabetic patients group and it raised significantly in the HD patients with diabetes was (3.81).

These data clearly indicated that the substances that accumulated into uremic serum did not affect GA values at all. The only factor that associated independently with GA value was the average FBS, which associated to a greater degree with GA compared with HbA1c [16]. Although the specificity and positive predictive value of HbA1c were acceptable, they were not promising; thus, to confirm diagnosis, we can not only rely on a slight elevation of HbA1c. The elevated GA/HbA1c ratio in diabetic dialysis patients, relative to diabetic subjects without nephropathy, strongly suggests that HbA1c was falsely reduced in diabetic subjects on hemodialysis. HD patients draw iron and vitamin B12 for the purpose of anemia correction such as external ESA. These treatment increases the development of immature RBC, which ultimately changes the original structure of the hemoglobin. Such RBCs are given inadequate exposure time to go through the process of glycosylation, which may result in lower concentration of HbA1c. The lower level of HbA1c may thus offer a false impression about the overall glycemic regulation [15; 16].

Conclusion: GA is a better marker for detecting short term glycemic control in HD patients with diabetes and the assessment of glycemic control by HbA1c in those patients might lead to underestimation, where the principle of treatment of DN is based on tight control of hyperglycemia.

Ethical Clearance: In this study all patients provided written informed consent before participation

in this study, which was approved by institutional ethics committees (university of Anbar\ ethical approval committee).

Pattern of Head Injuries in Deaths Due to Two-Wheeler Road Traffic Accidents

S.M. Krishna Sagar[1], Divya Reddy Pannala[2], K.V. Ramanamurthy[3], K. Rajender Kumar[4]

[1]Assistant Professor, Department of Forensic Medicine, Mahavir Institute of Medical Sciences, Vikarabad, [2]Assistant Professor, Department of Forensic Medicine, RVM Institute of Medical Sciences, Siddipet, [3]Professor, Department of Forensic Medicine, Osmania Medical College, Hyderabad, [4]Professor & Head, Department of Forensic Medicine, Gandhi Medical College, Secunderabad

Abstract

Background: In India, from the past two decades, along with urbanization, industrialization, population explosion and migration of people, there has also been rapid growth in the field of road transportation. Cons of this can be seen in the form of increased deaths due to RTA.

Method: We conducted a cross sectional studyin department of forensic medicine, Gandhi Medical College, Hyderabad including all cases of accidental deaths due to two-wheeler, aged above 6 years between October 2014 to May 2016.

Results: Majority cases were in the age group of 21-30 years, 27 (25.7%) and males 89(84.8%). Majority victims encountered accident due to skid 40(38.1%) and head on collision being common 50(47.6%). Linear fracture of vault was found in almost half cases, 53(50.5%). Subdural and subarachnoid haemorrhage were the most common one we encountered.

Conclusions: Males in productive age group encountered fatal RTA and also linear fracture, SDH and SAH were common pattern of injury seen in them. Stringent laws and awareness have to be created to reduce the fatalities.

Keywords: *Head injury, road traffic accident, two-wheeler, skull fracture, intra cranial haemorrhage.*

Introduction

Road traffic accidents have become a growing health and development problem. Approximately 1.35 million people die each year because of road traffic crashes in the world. More than 90% of road traffic deaths occur in low and middle income countries.[1]

In India, the increase in motorization along with expansion of the road network has brought not only rural economic development but also some adverse effects such as the increase in road accidents and among them most common are two wheelers as they constitute main vehicle fleet.[2]

RTA are likely to be seen in the age group 15-44 years and the usual causative factors being defective vehicle, due to defective rider and due to defective environment.[2,3]

The most prominent and vulnerable part of human body is head which made it more vulnerable for injury in road traffic accidents.[2] The most common cause of TBI normally reported in our country are road traffic accidents (RTA) accounting for 60%, followed by falls and assaults contributing to 25% and 10% of traumatic brain injuries, respectively.[4]

Head injury has been defined as "a morbid state, resulting from gross or subtle structural changes in the

Mobile Number: 9966253961

scalp, skull and/or the contents of skull, produced by mechanical forces. It has also been defined as physical damage to the scalp, skull or brain produced by an external force however, such force/impact, responsible for the injury need not be applied directly to the head.[5]

Thus, the study was taken up to determine the pattern of head injuries in people died due to accidents involving two wheelers which are subjected to post-mortem examinations along with the socio demographic factors of the victims

Method

This was a cross sectional study done in Forensic Medicine department of Gandhi Medical College and Hospital, Secunderabad. The study included all cases of accidental deaths due to two wheeler road traffic accidents which were admitted in Gandhi hospital and died eventually and also spot deaths which were directly brought to mortuary for post mortem examination over a study period of 2 years (October 2014- May 2016). Both rider and pillion rider who died due to head injuries with history of two wheeler road traffic accidents and aged above 6 years were included in the study and cases whose deaths occurred due to other vehicles and pedestrian deaths due to two wheelers were excluded. Socio demographic variables and details about manner of death were obtained from reliable attendants of the deceased, hospital records, police records and inquest reports submitted with autopsy requisition in each case by concerned police officers. Other details from the postmortem examination and reports. The family members, relatives and friends were fully explained about the questionnaire and then verbal consent was taken from each individual before asking about the relevant details pertaining to the study and thus a total of 105 cases were analysed.

Statistical analysis: Data was analysed using SPSS software and descriptive analysis was done. Data were presented in the form of tables, text, and figures.

Results

The mean age of the cases included in the study was 38.17±15.15 years. The cases mostly belonged to age group 21-30 (25.7%) followed by 31-40 years (23.8%), 41-50 years (18.1%), 51-60 years 16(15.2%), 11-20 years 9(8.5%), 61-70 years 5(4.7%), >70 years 3(2.8%) and <10 years 1(0.95%). Males comprised a majority of cases and constituted 89(84.8%) compared to females which was 16(15.2%).Considering geographical distribution of cases,77 (73.3%) were from rural area and 28 (26.7%) from urban area. Nearly half of them belonged to lower socio-economic status 48 (45.7%) followed by middle class,42 (40%) and upper class 15(14.3%).

Table 1 Characteristics of vehicle and related variables

Variable		Number (n)	Percentage (%)
Vehicle used by case during the time of accident	With gear	75	71.4%
	Without gear	30	28.5%
Rider/Pillon rider	Rider	94	89.5%
	Pillion rider	11	10.5%
Hit by type of vehicle	Two-wheeler	27	25.7%
	Four-wheeler	20	19.1%
	Heavy vehicle	18	17.2%
	Self-fall	40	38.1%
Type of collision during accident	Head on	50	47.6%
	Rear end	20	19%
	Self-skid	35	33.3%

In this study most of the cases used with gear vehicles, 75(71.4%) and were riding 94(89.5%) them at the time of accident. The major cause of accident was self-fall, 40(38.1%) due to skid and when accident was due to vehicle, then it was mostly two-wheeler, 27 (25.7%) and the collision was head on,50 (47.6%).

Table 2 Type of skull fracture due to head injury

Variable	Number (n)	Percentage (%)
Linear	53	50.5%
Depressed	9	8.6%
Compressed	8	7.6%
Crush	3	2.9%
Compressed & depressed	8	7.6%
Linear & compressed	1	1.0%
Operated	7	6.7%
Nil	16	15.2%

Table 3 Pattern of head injury

Variable		Number (n)	Percentage (%)
Contusion	Yes	88	83.8%
	No	17	16.2%
Laceration	Yes	45	42.9%
	No	60	57.1%
Abrasion	Yes	54	51.4%
	No	51	48.6%

Linear fracture, 53(50.5%) was the most common type of skull fracture and temporal bone was most involved. Contusion, 88(83.8%) was the commonest injury and in 70% of cases there were other associated injuries involving other parts of body. Among the intracranial haemorrhages, a combination of SDH and SAH accounted for 42(40%) cases followed by combination of SAH and ICH 20 (19%) cases and SDH alone accounting for 16 (15%) cases, 7 (6.6%) cases were SAH, 4(3.8%) ICH, 2 (1.9%) EDH and rest of the cases, there were multiple combination of intracranial lesions.

[Depicted in Table-2,3 and Figure-1,2]

Figure-2 Bone involved in skull fracture (multiple answers)

Discussion

This was a two-year study taken up in the forensic department of a tertiary care centre, Gandhi Medical college, Hyderabad, Telangana, India.

In this study, the cases mostly belonged to age group 21-30 (25.7%) followed by 31-40 years (23.8%),similar findings were seen in Mallikarjuna SK et al. [6]study where as in the study done by Amir et al. [7],29.8% were in the age group 30-39 years and 27.6 % were in the age group 20-29 years.

Males comprised a majority of cases and constituted 84.8% compared to females which was15.2%. The male to female ratio in the present study is 5.6: 1 indicating male preponderance, which is similar to the study done by Menon et al.[8] and Amir et al.[7]

The cases were mostly from rural area (73.3%) and majority of them belonged to lower socio-economic status (45.7%) and middle class (40%), while the study done by Ranjana Singh et al.[9] showed that urban cases (64%) outnumbered rural(36%).Likewise, according to WHO, more RTA fatalities in India were among low socio-economic groups.[9]

In this study most of the cases used with-gear vehicles, 71.4% similar to study done by Lohith Naik et al. [10] .More than 2/3 rd of the cases,89.5% were riding vehicle at the time of accident as seen even in the study done by M. Seethalakshmi et al.[11] . The major cause of accident was self-fall which 38.1%, reason being skid and when accident was due to vehicle collision, it was mostly two-wheeler, 25.7% and the collision was head on,47.6% where as in study done by M. Seethalakshmi et al. [11],it was collision with light motor vehicle.

In this study, linear fracture,50.5% was the most common type of skull fracture and temporal bone was most involved. Contusion, 83.8% was the commonest injury and in 70% of cases there were other associated injuries involving other parts of body. Similar findings were seen in the study by M. Seethalakshmi et al. 11, where tempero-parietal region was the most common region involved in fracture and among injuries, 42.8% were abrasions. 68% were contusions and 34% were lacerations and more than 70 % cases had associated injuries involving other parts of body.

Like wise, in a study done by Pathak et al.12 most of the victims of fatal head injury were having linear fracture of either skull vault or base of the skull or both which was 43%, especially in the thin areas of temporo-parietal bone. Another study by Rajeshwar et al.2 also reiterated the findings our study and showed that majority of victims who died from head injury had association with injuries to thoraco-abdominal area and extremities which was 50.64% of total cases and only 15.86% deceased showed head injury without any other associated injuries.

Among the intracranial lesions, a combination of SDH and SAH accounted for 40%cases followed by combination of SAH and ICH 19% cases and SDH alone accounting for 15%cases, 6.6% cases were SAH, 3.8%ICH, 1.9%EDH and rest in rest of the cases there were multiple combination of intracranial haemorrhage. Similar findings were seen in the study by Amir et al.7 where intra cranial haemorrhage was seen in 85.9% of cases and of all bleeds SAH accounted for 55.8%. Even in studies conducted by Pathak et al.12 and Rajeshwar et al 2 SAH and SDH were the common type of bleeds among intra cranial haemorrhage.

Conclusion

This study reveals that fatalities due to RTA are remarkably high in productive (21-40) year age group, and most victims are males belonging to rural area and low socio-economic class. Linear fracture involving temporal bone and SAH were also common. Road safety awareness programs must be regularly conducted to bring awareness amongst adults. Strict laws, compulsion of helmet usage for both rider and pillion rider and behaviour change communication activities may be game changer in prevention of such high fatalities.

Further study has to be conducted on the factors involved in RTA which may help in better understanding of the situation.

Ethical Clearance: Taken from the Institutional Ethical Committee of the medical college.

Abstract

Background: To assess the relationship of alcohol abuse in maxillofacial trauma in a tertiary care hospital, Puducherry, South India.

Materials and Method: A descriptive cross sectional study was done by retrieving the patient's inpatient and operative records from the year 2011 to 2018. The parameters that were assessed includes association of the alcohol during injury, etiology, demographic data and the type of fracture.

Conclusion: The descriptive analysis of the facial fractures in Puducherry, INDIA provides an insight in to type of facial fractures and their etiology recorded in patients with alcohol abuse during injury. These kinds of studies in the particular geographical region are important in developing prevention strategies.

Keywords: *Alcohol abuse, maxillofacial, fracture, mandible, zygoma.*

Introduction

Alcohol consumption is an increasing social trend nowadays in any part of India. Over indulgence of alcohol and injuries under the influence of alcohol is commonly encountered in maxillofacial trauma management settings. Face is the most targeted part of the body for all interpersonal violence throughout the world. Interpersonal violence and alcohol consumption has an inseparable correlation. Roads should have made safer for all citizens because a large percentage of population–children, pedestrians, cyclists, motorcyclists, and the elderly are most vulnerable[1]. Indian researches on road safety measures claim that alcohol consumption is a threat to our civilization leading to premature life loss and downstream ones economic status. This must be prevented by a holistic approach on this firing issue[2]. According to WHO, RTA accounts for 9 th position of DALY (*disability-adjusted life year)* loss but in 2020 it can reach to third position[3,4,5]. With the present scenario of alcohol consumption due to increase social activities in young adults, we conducted a descriptive cross sectional study on the influence of alcohol and the correlation with maxillofacial trauma patterns in Puducherry, south India.

Assistant Professor, Department of Ophthalmology, Indira Gandhi Medical College & Research Institute (Govt.), Puducherry-605008, India

Materials and Method

The descriptive study was carried out for the period of 7 years (2011-2018) at the Department of Dentistry,

IGMC & RI after getting ethical committee clearance (IEC no: 17/163/IEC/PP/2018).In patient records were retrieved and data were entered in a structured proforma. Data retrieved were analysed using SPSS SOFTWARE - 24. The compiled data were analysed using descriptive and inferential statistics. The parameters that were assessed include association of the alcohol during injury, etiology, demographic data and the type of fracture.

Inclusion Criteria: Maxillofacial trauma victims of both the genders in the age group of 18 to 65 years were included in the study.

Maxillofacial fractures that had occurred when patient was under the influence of alcohol (H/O alcohol consumption within six hours before the trauma)

Patients with isolated maxillofacial fractures

Patients who underwent surgery for maxillofacial fractures

RTA involving -motorised/non motorised two wheelers (both as riders and pillion riders),

- Light motor vehicles/heavy motor vehicles
- and pedestrians vs. any motorised vehicle

Self fall under the influence of alcohol

Interpersonal assault

Exclusion Criteria:

Pregnant females

Unconscious patients

Poly trauma

Pan facial fractures

Maxillofacial fractures treated by conservative method

Soft tissue injuries without fractures

Isolated Dentoalveolar fractures

The study population of 100 (N=100) samples fulfilled the above criteria and were included in the study.

Results

Out of 163 patients operated for 7 years (2011-2018) in the Department of Dentistry,100 patients suffered maxillofacial fracture under the influence of alcohol (N=100).

Frequencies of different parameters assessed (table -1) shows males at the age group of 21 to 30 years suffered maxillofacial injuries under the influence of alcohol. RTA was the most common etiology and Mandibular fracture is the commonest type of fracture encountered.

On assessment of age distribution (fig-1)it reveals that the most vulnerable age group is 21 to 30 years followed by 31 to 40 yrs and 41 to 50 years with equal frequency. Males (94%) suffered maxillofacial trauma under the influence of alcohol in a larger proportion compared to females (fig-2). RTA is the most common etiology followed by self fall and then assault (fig-3).

On assessment of type of fracture (fig-4), the most common fracture encountered were fracture Mandible (symphysis,parasymphysis,angle,body,ramus and condyle of the mandible). Mandibular fracture (60%) was followed by fracture zygoma (36%) (zygomatico maxillary complex and the zygomatic arch). In mandibular fracture the common subtype encountered was angle of the mandible followed by mandibular condyle.

On analysis of the association between the parameters such as age and the etiology of trauma under the influence of alcohol (table-2), the most vulnerable age group being 21 to 30 years and they succumbed to RTA was elicited.

Association between the commonest types of fracture in the vulnerable age group of 21 to 30 years (table-3) revealed that this particular age group had fracture Mandible more commonly than fracture Zygoma.

Further, the association between the etiology and the type of fracture (table-4) revealed that most of the RTA resulted in fracture Mandible followed by fracture Zygoma.

Discussion:

Alcohol drinking is a severe socio economic issue in India. Consumption of alcohol small amounts every day, drinking alcohol 6 hrs before driving, binge drinking everyday or occasionally in a week all leads to RTA[6]. RTA is the major etiology of maxillofacial trauma in developing countries like India[7]. Alcohol abuse and its relationship to trauma had reached massive proportions[8].

Alcohol with blood levels 0.04 g/dl can hinder in patients decision making and does not make them to realise the foreseen danger, 0.05g/dl increases the risk by 1.83% and affects treatment and prognosis in RTA management[9,10,11]. In India alcohol breath testing is done randomly on susceptible drivers in police checkpoints. Alcohol breathe testing and alcohol blood testing is done on crash drivers in the hospitals but a clear data on this is lacking. Thailand is the only south East Asian country to enforce special blood alcohol concentration limit [12].

Alcohol interferes with neuro transmission and the function of brain receptors[13]. This decrease in function makes people fearless and less bothered about legal or

health implications[14]. Alcohol consumption reduces cognitive behaviour and reduces a person's problem solving ability in a conflicting situation. Further it causes increase in aggressiveness and increases emotional responses[15-18]. Adeyoma et al[19] recorded that 90% of fatalities in developing countries were because of RTA under alcohol abuse.

Use of restraints such as helmets and seat belts is of paramount importance in preventing maxillofacial trauma. Bekal et al[20] recorded that the incidence of maxillofacial trauma increased due to non utilisation of restraining devices in and around Bengaluru, India. Helmets are not gender specific. In India a common misconception is that full facial helmets are meant for males and semi helmets are meant for females. This renders most of the females vulnerable to facial fractures. Although use of restraints such as helmets and seat belts are mandatory in any part of India, the compliance is less. Bekal et al[20] and Pandey et al[21] recorded maxillo facial fractures in RTA because of not wearing helmets or not wearing seat belts.

In our study males were commonly affected than females which are in concurrence with most of the studies published from India[22,23]. Puducherry city, capital of the union territory is a former French colony and a major tourist attraction. The city attracts lots of tourists and workers from adjoining rural area. The main modes of transportation are two wheelers and hence the recorded maxillofacial trauma was high in males as males are the earning members in developing country like India. We recorded maxillofacial trauma in six females who were pillion riders without use of helmets or wearing semi helmets under the influence of alcohol.

Mandible is the most common fracture encountered in this region (60%). This can be explained by the fact that most of the injuries are due to RTA involving motorised two wheelers without the use of helmets. The next common type of fracture being zygoma and zygomatic arch (36%). The type of fractures recorded were similar to the study recorded by Kapoor et al[24].

Conclusion

The descriptive study, maxillofacial trauma under alcohol abuse clearly reveals the association of the trauma under the influence of alcohol in and around Puducherry. Use of restraining devices, proper maintenance of faulty roads, rehabilitation of drunk and drive crash drivers to prevent repeated injury are mandatory.

Histopathological Grading and Enzyme Histochemical Study of the Placenta in Gestational Diabetes Mellitus Pregnant Women

Sahar A.H. AL-Sharqi[1], Amal Kadhem Chaloob[2], Ilham Abd Allah Ali Al-Saleem[3]

[1]Assistant Professor, Department of Biology, College of Science, Mustansiriyah University, Baghdad/Iraq,
[2]Assistant Professor, Department of Basic Science, College of Dentistry, Mustansiriyah University, Baghdad/Iraq,
[3]Lecturer, Department of Biology, College of Science, Al-Mosul University, Mosul/Iraq

Abstract

Gestational diabetes mellitus (GDM) constitutes carbohydrate metabolism disorders that lead to severe and sometimes life-threatening complications of pregnancy.

Materials and Method: 40 placenta biopsies with blood samples were taken from gestational diabetic pregnant women and 20 placenta biopsies with blood samples were taken from healthy pregnant women, the tissues were fixed,processed, embedded and cutting separately depending on procedure for enzyme histochemical and routine histological technique and the bloodwas centrifuged.

Results: The histological changes inthe GDM group represented by villous oedema in approximately (30%) of the GDM group, an excessive amount of collagen fibres in the villous stroma (57.5%). Syncytial knots were formed (70 %) in addition to an excessive number of cytotrophoblast cells in about (65 %). The stromal fibrinoid deposition was noticed in (52.5 %). Hypo-vascular villi are seen in (32.5%) also, atherosis of the uteroplacental arteries in (40%) of biopsies. In enzyme histochemistry, the villous stroma of the GDM groupshas a strong reaction to the G-6-P enzyme. There is a significant increase ($p<0.05$) in serum blood sugar, cholesterol, blood urea in the GDM group when compared with the normoglycemic group.

Conclusions: The increment of serum blood sugar caused histologicaland enzyme histochemical alteration during pregnancies.

Introduction

Gestational diabetes mellitus(GDM) is defined as a condition of glucose intolerance that appears during pregnancy[1]. This type of diabetes accompanies the pregnancy period and disappears after birth. It is a medical complication that affects about 3-10 % of pregnant women, and it appears more in women with a family history of the disease.[2]

Corresponding Author:
Sahar A.H. AL-Sharqi
Assistant Professor, Department of Biology, College of Science, Mustansiriyah University, Baghdad/Iraq
e-mail: saharalsharqi@uomustansiriyah.edu.iq

Diabetes occurs during the second trimester of pregnancy[3], but most of it occurs in the third trimester of pregnancy, as the mother is likely to develop diabetes after childbirth, especially type-2 diabetes mellitus [4]. The causes of GDM in some women are not known in a specific way, but there are contributing factors in the occurrence of the disease, including the interference of the hormones required by the fetus's growth that is an obstacle to the work of insulin[5], and that weight gain may lead to increased insulin resistance and insulin resistance will deprive the fetus of the benefit of the effect of insulin product[6]. The placenta during pregnancy produces additional amounts of the hormone (Cortisol) and other hormones that are anti-insulin, such as progesterone and human chorionic gonadotrophin and the human placental lactogen[7]. All of these hormones increase the level of glucose in beta cells. Beta-cells in the pancreas is

unable to produce sufficient amounts of insulin to offset this increase in the level of glucose or there was insulin resistance by the mother (Maternal insulin resistance) as this increases the possibility of a case of excess glucose in the pregnant mother (Hyperglycemia) or what it is called GDM[8,9]. The incidence of complications of GDM in Iraq has increased dramatically in recent years and the health importance of pregnant women and the complications that occur during pregnancy.

The current study aimed to identify some of the histopathological,enzyme histochemical and biochemical changes accompanying these complications.

Materials and Method

1. **Study Samples:** The 60 placenta tissue and blood samples were obtained for pregnant women from Baghdad Teaching Hospital and based on the medical diagnosis by the gynaecologist. A questionnaire was completed containing much information about the pregnant woman, the diseases she had during pregnancy and the laboratory tests that were performed. The women under study were divided into two groups:The first group of 40 pregnant women with GDM, age ranging from 20-43 years. The second group 20 normoglycemic pregnant women,age ranging from 18-40 years.

2. **Tissues collection:** Placental tissue biopsies were collected and dissected from the central part of the placental bed after normal vaginal deliveries or caesarian section and prepared for histopathological and enzyme histochemical analysis as follows:

   The fragments for the histopathological study were then immediately fixed in formalin 10%, dehydrated in a graded ethanol sequence and embedded in paraffin according to a standard protocol, sectioned at 5 µm and installed for the staining with Hematoxylin-Eosin (H & E) on glass slidesand examined under the microscope[10]. The fragments for enzyme histochemical study were then immediately fixed and dehydrated in a mixture of equal volumes of cold acetone and absolute alcohol for 24 hoursfor demonstration of Glucose-6-Phosphatase(G-6-Pase) were based on the modified procedure described by[11].

3. **Blood samples collection:** The 5 ml of venous blood was drawn for each of the women from the study groups, the blood was placed in a test tube and left at laboratory temperature 15-25 ° C until the thrombus was formed, then the thrombus was separated by the centrifuge at 3000 rpm for five minutes, a serum was withdrawn and preserved-20°C until laboratory tests.

4. **Biochemical test:** Serum Glucose, Cholesterol andUrea were determined by an enzymatic method with the commercially available kit (Rondox).

5. **Statistical Analysis:** All results are expressed as Mean values ± Standard Deviation or as N (%). For computation, we used the SPSS program version 25 for Windows (SPSS Inc., Chicago, IL, USA) software package. Differences were considered as significant if $p< 0.05$.

Results and Discussion

A. Placental tissues: Placental tissue from normoglycemic, chorionic villi test appeared as vascular villous stroma surrounded by multinucleated syncytiotrophoblastic layer with indistinct cell borders and darkly stained nuclei. Very rarely we have been able to distinguish villous cytotrophoblastic cells that behave as ovoid, greatly variable in thickness, with well-defined cell borders and light cytoplasm staining. The villous stroma consisted of a core of connective tissue that had several bundles of collagen fibres and flattened fibroblasts. There were 2-5 dilated capillaries lined with fetal blood in the villous stroma (Fig. 1A & B).

All the placenta obtained from the two groups were stained with H & E histological stain. On examination of these sections with a light microscope, our result recognized several histological changes with different proportions. These changes are listed in (Table -1) as following:

Villous oedema was easily seen in the placenta stained, it was seen in 12 placentae (30 %) of the GDM group. However, we couldn't find placentae with villous oedema in the normoglycemic group, (Fig. 2A).Other studies found that one of the pathological features of placentae in hyperglycemic pregnant women is villous oedema[12]. The intervillous distance was of variousextent, but some of the distance wasvast when compared with normal placentae resulting from intervillous oedema with the increased amount of fibrinoid[6]

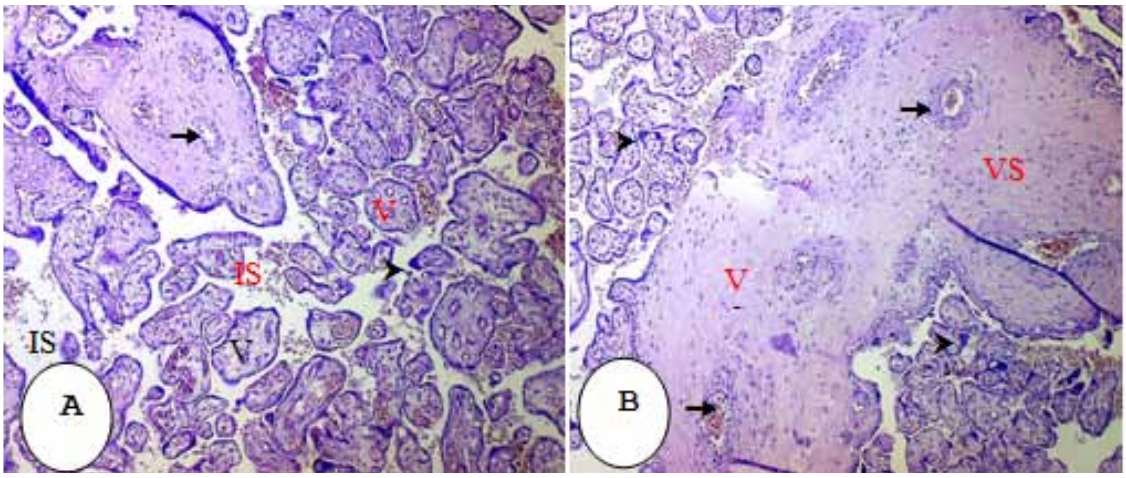

Figure (1): Light microscopical appearance of normoglycemicpregnant women placenta showingmicrovilli (V) with narrow intervillous spaces (IS) and syncytial knots (head arrows). The villous stroma (VS) shows blood vessels (arrows) containing bloodcells, (A & B:H & E staining, X10).

On the other hand, an excessive amount of collagen fibres in the stroma of the villi was easily demonstrated, stromal fibrosis was observed in 2 placentae (10%) of the normoglycemic group, but increased up to 23 placentae (57.5%) from GDM group, (Fig. 2B). This results matchedwith other studies that observeda histological change in GDMplacentae represented by stromal fibrosis[6]

Syncytial knots were formed in more than one-third of the examined villi, in 28 placentae (70 %) from the GDM group. However, this deviation from the normoglycemic group was noticed only in 4 placentae (20 %) (Fig. 2C).More than previous paper observed Syncytial knots in placentae of GDM pregnant women[6,.13]. Immoderate forming Syncytial knotsis a relationship with placental pathology, and a knotting indicator is employed to estimateriskiness.[14]

In GDM group cases an excessive number of cytotrophoblast cells have been frequently observed. This change was observed in the normoglycemic group in only 2 placentae (10 %), in the GDM group in 26 placentae (65 %). El Sawy etal[6] and other study[15] confirm that one of indicator of placentae tissue of GDMpregnant is cytotrophoblast cells proliferation[6].

Stromal fibrinoid deposition affecting of the villi was observed in the normoglycemic group 4 placenta (20 %). Although it was found in 21 placentae (52.5 %) in placentae obtained from the GDM group, (Fig. 2D). Another study confirmsthat the morphological feature ofvillous tissue in GDM of women is fibrin deposite[13]. Hypo-vascular villi are seen in 3 placentae (15%) of the normoglycemic group and 13 placentae (32.5%) of the GDM group, (Fig. 2E).Astudy on placentae tissue in hyperglycemic pregnancy noticed alterations in vascularity repeating by surprisingly hypovascular and these had a smaller diameter and show a wavy course compared with normal villi.[16]Also, atherosis of the uteroplacental arteries appears as multiple foamy cells within the walls of the vessels. It was seen only in one placenta from the normoglycemic group (5%), and in 16 placentae (40%) from the GDM group, (Fig. 2F).Astudy found that placental atherosclerosis occurred in 28.94% of the group with GDM compared to 10.52% of the group with normoglycemicpregnancy[17].

Table – 1: Histological grading of placentaltissues in GDM and normoglycemic groups

Histological finding	Normoglycemic group N=20 (%)	GDM group N=40 (%)	P-Value
Villous edema	0 (0 %)	12 (30 %)	0.01
Stromal fibrosis	2 (10 %)	23 (57.5 %)	0.01
Syncytial knots	4 (20 %)	28 (70 %)	0.01

Histological finding	Normoglycemic group N=20 (%)	GDM group N=40 (%)	P-Value
Cytotrophoblastic cell hyperplasia	2 (10 %)	26 (65 %)	0.01
Fibrinoid deposition	4 (20 %)	21 (52.5 %)	0.01
Hypo-vascular villi	3 (15 %)	13 (32.5 %)	0.01
Atherosis of uteroplacental vessels	1 (5 %)	16 (40 %)	0.01

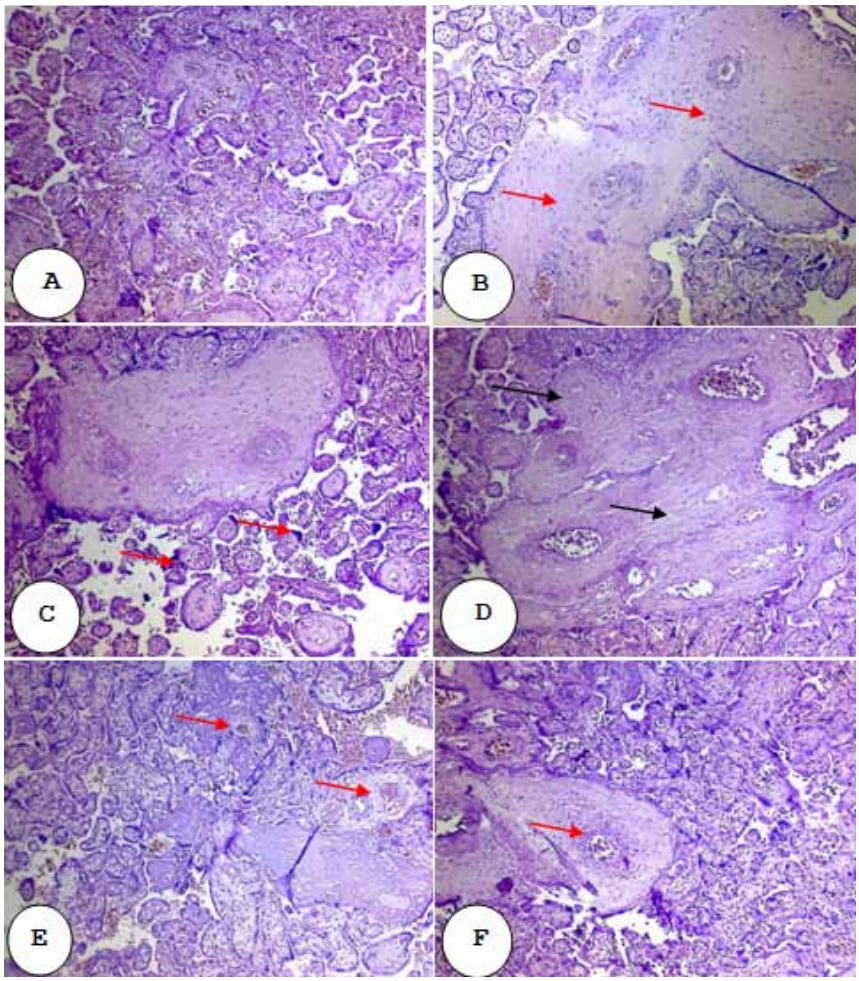

Figure (2): Light microscopical appearance of GDM placenta showing, (A):Villous oedema (B):stromal fibrosis (red arrows), (C):Syncytial knots (red arrows), (D):Fibrinoid deposition (black arrows), (E):Hypo-vascular villi (red arrows), (F):Atherosis of uteroplacental vessels (A & B:H & E X10).

B-Enzyme histochemical of Glucose – 6 - phosphatase: The placental tissues acquired from normoglycemic women or other maternal disorders exhibiting a weak reaction to the enzyme G-6-Pase (Fig. 3A & B). The villous stroma showed more dense activity to the G-6-Pase(Fig. 3C & D), while the trophoblastic showed moderate activity to G-6-Pase in the placental tissue of GDM pregnancy (Fig. 3E & F). The G-6-Pase plays the important role of supporting glucose during starvation, an enzyme product mainly in the kidney and the [18]. The moderate reactive with normoglycemic proof that it presents in the placenta and this was in a match with other studies that detectthe G-6-Pase histochemically in the syncytiotrophoblasts of the placenta[19]. In our study we found that thereis astrong activity of the enzyme in hyperglycemic tissue, the previous result confirms that by documentation 2-3fold increasing the activityof G-6-Pase in the liver of diabetic[20]. G-6-Pase is an enzyme that analysis Glucose 6-phosphate, lead to the formation of afree glucose and phosphate group.[21] When the activity of G-6-Pase increases, free glucosealso increases and our results from the increased blood sugar in hyperglycemic pregnancy supporting these results.

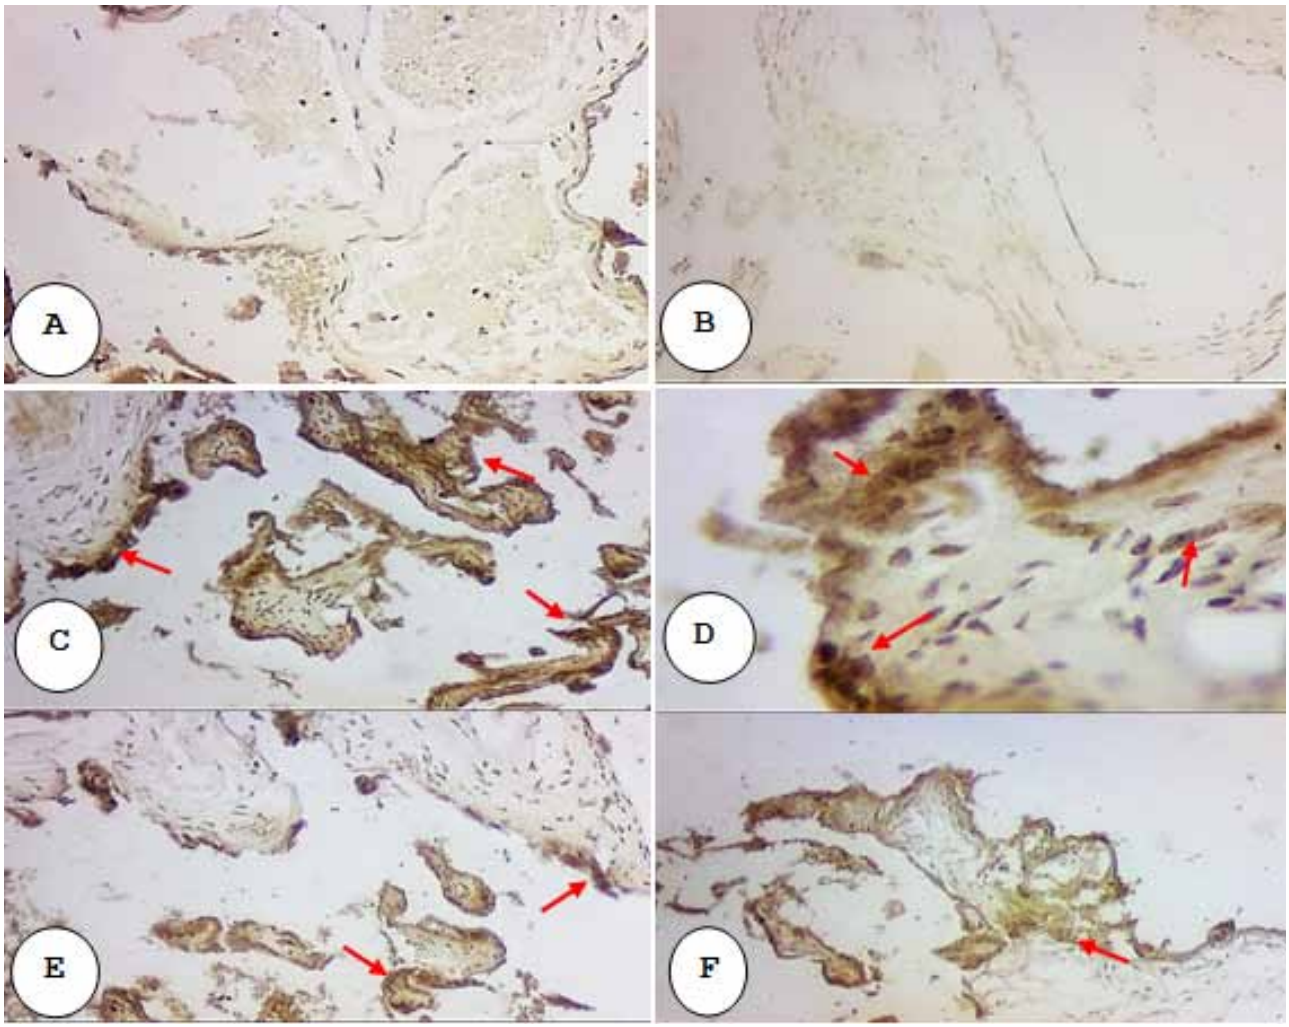

Figure (3): The light microscopical appearance of placental tissue: A & B obtained from normoglycemic showing a weak reaction to the G-6-Pase (arrows), C & D: strong reaction to the G-6-Pase in syncytiotrophoblast (red arrows) and cytotrophoblast cells, E & F: moderate reaction to the G-6-Pase, in placenta GDM(G-6-Pase, X10).

C-Biochemical study: The serum level of glucose for both healthy pregnant women and GDM pregnancy is shown in (Table -2). A significant ($p<0.05$) increase is found in the mean value of the glucose in GDM pregnancy (173.82±2.47mg/dl) compared with that of the healthy pregnancy (84.04±2.3mg/dl).

High glucose or diabetes during pregnancy may be caused by a decrease or resistance to the hormone insulin by placenta hormones such as progesterone or human placental lactogen, or as a result of the increase in the secretion of the hormone cortisol that occurs during pregnancy [22,23]. Jansson et al[24] showed that the high level of glucose from its normal level leads to an increase in its transmission to the placenta. Also, the imbalances in carbohydrate metabolism during pregnancy lead to many complications for the mother [25].

While the serum cholesterol level is found to be significantly ($p<0.05$) increased in the mean of GDM pregnancy when compared with that of a healthy pregnancy. Table (2) showed the mean of GDM pregnancy to be (224.50±7.68 mg/dl), while in a healthy pregnancy is (184.80±4.34 mg/dl). The increase of total cholesterol level in the serum of women with GDM in the current study supports the results study of Quinlivan and Lam[26], and its rise can be attributed to the occurrence of a disorder of fat metabolism ((Dyslipidemia) as a result of the disease[27]. Several studies have shown approaches during the and beyond the pregnancy, adverse metabolic consequences of diabetes[28].

Recently, the high levels of cholesterol can cause atherosclerosis,research has shown that low density lipoprotein cholestrol LDL-C is not the only type of cholesterol that increases the risk of atherosclerosis, and that any non-HDL-C cholesterol, such as very-low-density lipoprotein cholesterol (VLDL-C) and apolipoprotein B, that increase that risk [29]. Study of Ryckman et al [30] found that women with previous GDM Insulin resistance elevate the VLDL-C abnormalities contained in non-high-density lipoprotein cholesterol (HDL-C) along with (LDL-C) and lipoprotein of intermediate density.

Recently, blood urea has been documented to be associated with diabetes mellitus(DM), commonly regarded as one of the markers of kidney functions [31]. On the one hand, (DM)cause kidney disease, and on the other hand, kidney disease may increase the risk of (DM), including urea or other uraemic elements [32,33]. Our result showed the level of serum urea shows an increase in GDM pregnancy as compared with a healthy pregnancy, (Table 2). The mean value of serum urea in GDM pregnancy is found to be (28.12±1.06 mg/dl), and in a healthy pregnancy is (21.5±1.2 mg/dl). Statistically, there is a significant ($p<0.05$) difference between the two groups.

This result is consistent with many researchers who indicated that the GDM condition leads to a rise in the level of urea in the blood serum, and this rise is due to the physiological change as a result of the pathological condition which leads to a decrease in the rate of glomerular filtration rate (GFR). This causes a rise in the level of urea in the blood serum [34,35].

Table 2: Serum Glucose, Cholesterol and Urea level in GDM and Normoglycemic women.

Study Groups	Glucose (mg/dl)	Cholesterol (mg/dl)	Urea (mg/dl)
Pregnant women with GDM	173.82±2.47	224.50±7.68	28.12±1.06
Normoglycemic women	84.04±2.3	184.80±4.34	21.5±1.2

Conclusions

The hyperglycemia during pregnancy leads to the serious histological changes in placentae representing by oedema in stromal villi, fibrinoid deposition, hypovascular, atherosis of uteroplacental arteries. The villous stroma showed more dense activity to the G-6-P enzyme that indicates to increase the sugar content in it and the study found a strong relationship between hyperglycemia during pregnancy and the rise of serum cholesterol and urea in blood serum.

Abstract

This study aimed at assessing patient's satisfaction with new optimized conventional complete upper and lower dentures as compared to their previous problematic conventional dentures. A random sample of patients was selected (group 1). Each patient was provided with new optimized conventional upper and lower dentures (group 2), then a subset who were not satisfied with the optimized lower prostheses were provided with two implant-retained lower over-dentures (group 3). Self-assessment questionnaires were voluntarily filled by the participants. Male-female differences were assessed using the two independent samples t-test. Inter-group differences were evaluated using the two dependent samples t-test. Significant differences were found between sexes in group 2, but not in group 3, in the direction of females being less satisfied than males especially with the lower denture, and between the groups in a number of variables in the direction of more satisfaction with the lower dentures among group 3 as compared to group 2. Meanwhile, group 2 and 3 were found to be equally satisfied with the upper denture.

Keywords: *Patient's satisfaction; conventional complete denture; optimized conventional complete denture; two implant retained lower over-denture; atrophic edentulous mandibular ridge*

Introduction

In most societies, the need for complete dentures is increasing due to edentulism. Although, implant-retained overdentures may be considered the best option in the rehabilitation of edentulous individuals, conventionally made complete dentures will remain an important treatment option in the oral health care for the growing elderly population due to economic reasons[1,2]. Residual ridge resorption is a complex biophysical process[3, 4]. More pronounced resorption happen in the mandible than maxilla with an average rate of 0.2 mm annually[5-8].

Treating with atrophied ridges poses a clinical challenge to dentists that associated with unpleasant appearance, pain and discomfort as a result of unstable and non-retentive dentures[3, 6, 9-11].

Clinical experience and dental research reported various problems associated with edentulism[12-14]. To improve health care quality, patient perceptions are crucial, therefore, assessment and treatment outcomes are very important[15]. As well as complete dentures therapy[16-19].

Two main method have been used to assess and evaluate the acceptance of dental prostheses. The first method is objective assessment of masticatory function and speech articulation[20-23]. The second method is by evaluation of patient's perception of treatment by self-assessment tools (questionnaires)[24].

Edentulous patients showed a moderate level of satisfaction[25-27]. For instance, 3% to 40% of patients were reported to be unable to adapt to their dentures among removable partial dentures wearers 2, 28. Patient satisfaction with complete dentures seems to be a complex socio-cultural issues[29]. Denture quality showed controversial impact on satisfaction. Some authors have observed that most of denture quality criteria do not correlate with patient satisfaction [30, 31]. In another study [32] patients were satisfied despite technical problems, but satisfaction increased as denture quality improved, mainly regarding retention and stability. Other studies firmly presented a strong correlation between denture quality and patient satisfaction [33, 34].

Patient satisfaction with implant retained complete dentures has also been evaluated by subjective and objective method. For example, satisfaction with mandibular implant-retained over-dentures, retained by ITI$^{\dot{O}}$dental implants, was assessed subjectively for six years of use. It was reported that an extremely high proportion (95%) were satisfied with their new prostheses with respect to function, comfort and social rehabilitation [36]. In a multi-center study, Boerrigter et al. [37] carried out a comparative investigation using self-assessment questionnaires in two groups of 150 patients who had long-standing mandibular denture problems. Patients in the first group were treated with mandibular over-dentures retained by two implant fixtures, opposed by optimized maxillary complete dentures. Patients in the second group were provided with new optimized complete dentures in both jaws, as a control group. It was reported that patients treated with implant-retained over-dentures appeared to be more satisfied than the control group, and this was reflected in the overall satisfaction with denture function, aesthetics, comfort and speech. While it was reported that in general terms more than half of the control group was satisfied with the new conventional dentures, it appeared that only a small number of patients were satisfied with the conventional mandibular dentures.

Materials and Method

The study sample consisted (12 females and 18 males) aged between 35 and 75 years, and with a mean age of 60.1 years (SD = 8.4).

Before starting examining the patients, all ethical approval that acquired were signed. Patients then were examined thoroughly and their complaints were recorded and classified according to Cawood and Howell [38] as demonstrated in (Table 1).

Upon clinical examination, they approved to be subjected to preprosthetic surgery. All the pre-prosthetic procedures in form of alveoloplasty were carried out for the five patients. ADMIX technique advocated by McCord and Tyson [35] was used.

After three months of using the new dentures, four of the patients were satisfied with their optimized lower dentures in conjunction with the usage of denture adhesive glue (SUPER COREGA-Ireland) [26].

Three months after later, patients were again asked about their opinions with respect to masticatory function, using the same questionnaire where a comparison was made between the optimized conventional dentures and the implant-retained mandibular over-dentures. The same self-assessment questionnaire was filled by all patients to compare if any significant changes were improved in comparison with optimized conventional dentures (Table 2).

Statistical differences between males and females in the variables considered were examined by the two independent samples *t*-test, and the differences between the groups were assessed using the two dependent samples *t*-test (SPSS, Version 17.0, Inc., Chicago, IL). The 0.05 level was chosen as the threshold value for statistical significance.

Findings: No statistically significant differences were found between males and females in the average overall satisfaction with the lower dentures between group 2 and 3, and with upper dentures between group 2. Although there was a relative difference, the level of satisfaction differs after 3 months between Males and females.

There were no statistically significant differences between the sexes between the third group with regard to all responses to the questionnaire questions. However, significant differences were found between males and females between Group 2 in the mean scores for responses to a number of specific questions asked in the questionnaire.

The two-sample t-test showed that there was no significant difference in the mean overall satisfaction with the upper denture between Group 2 and Group 3. The mean overall satisfaction with the lower teeth

was significantly higher between Group 3 compared to Group 2.

It was found that the average degree of abstinence from wearing upper dentures was zero in groups 2 and 3.

Average scores were found for the following variables: abstinence from wearing lower dentures, refusal to participate in social activities, and negative impact on self-confidence - significantly lower among group 3 compared to group 2.

Median scores for the following variables: pain from wearing a lower denture, slipping of the lower denture while eating, problems with speech, chewing problems, and a denture being considered a foreign body were significantly higher among Group 2 compared to Group 3.

Table 2: Response to questions concerning oral functions of dentures before and after treatment.

Questions	Variables	Optimized (n out of 30)				Implant-OD (n out of 26)			
Scale (0-3)		0	1	2	3	0	1	2	3
Did you wear your dentures all the time?	UD LD	30 -	- -	- 10	- 20	26 26	- -	- -	- -
Does your lower denture cause pain?		-	5	23	2	26	--	-	-
Does your lower denture slip while eating?		-	8	18	4	26	-	-	-
Does your lower denture cause speech problem?		-	14	15	1	26	-	-	-
Do you have chewing problem with your dentures?		-	6	14	10	23	2	-	-
Did you refuse social invitations because of dentures?	Male Female	-	5 -	13 5	- 7	16 -	- 2	-	-
Does the denture affect your self-confidence?	Male Female	-	5 -	13 5	- 7	16 -	- 2	-	-
Do you consider the denture part of your body?		-			30	26	-	-	-
Overall satisfaction (Scale 0-10)	UD LD	> 5 = (30) >5 = (4) <5 = (20) 5 = (6)				> 5 = (26) > 5 = (26)			
Will you do the surgery again?		90-95% (yes)							

OD = over-denture; UD = upper denture; LD = lower denture.

Discussion

The ultimate goal is patient satisfaction[2]. Therefore, restoring mandibular function is crucial. Male-female differences has been previously studied [39]. It has been suggested that females report pain symptoms, and they recall health problems to more than males do[40]. This study revealed no differences between males and females satisfaction with either the upper or the lower dentures among group 2. However, the satisfaction level was greater in males and the difference was almost approaching statistical significance in the case of the upper denture among group 2. Regarding group 3 upper denture, males were significantly more satisfied than females.

Significant Male-female differences among group 2 were found in a number of the mean scores for the responses to the specific questions asked in the questionnaire, where females showed significantly more refusal of engagement into social activities and adverse impact on self-confidence. On the other hand, in another study, both male and female edentulous patients were well-satisfied with their social ability after wearing the prosthesis [41]. Few studies investigating oral prostheses have reported sex differences. Moroi and Coworkers studied the effect of oral prostheses on the quality of life of head and neck cancer patients, and they reported that in both a cancer group wearing maxillofacial prostheses, as well as in a control group wearing conventional dentures, females rated most variables lower than the males [42]. In a study by Panek et al, found that males could adapt more easily to new removable partial dentures than females. The need for ‘‘three and more visits for adjustment after delivery’’ was found to be significantly more common among females than males[43]. In another study, elderly females were less satisfied with conventional dentures than elderly males with regards to aesthetics and ability to chew, but equally satisfied with implant over-dentures[44]. The quality of satisfaction has been found that males were more satisfied than females. There was equal satisfaction level in comfort and social status of both the groups [45]. Females and males differences in perceptions could be explained by either physical or psychological differences between the sexes. It has been suggested that variety of factors may contribute, including hormonal alterations[46], blood pressure[47], and psychological factors[48]. Furthermore, sex role expectancies and anxiety may moderate sex differences[48].

Several long-term studies have confirmed that implant-retained dentures provide satisfactory results with only two implants in the lower jaw [49-51]. Therefore conventional dental treatment is not considered the standard of care[52,53]. In this study, the level of satisfaction was greater, with lower dental implant retention among group 3 than the optimal conventional denture among group 2.

Refraining from wearing the lower denture, refusal of engagement into social activities, and the adverse impact on self-confidence were found to be significantly lower among group 3 as compared to group 2. Kutkut et al.[54] in a systematic review stated the same; treating conventional complete denture wearers with implants to retain their dentures led to obvious improvements of patients’ satisfaction with their oral status as measured by questionnaires and interviews. In the majority of the studies, implant-retained over-dentures were superior to conventional complete dentures with regards to efficacy, satisfaction, and quality of life[49-53].

Conclusion

Within the limitations of the present study, it can be concluded that two-implant retained lower denture is the most satisfactory in case of severely atrophic edentulous mandibular ridge while the optimized upper complete denture provides adequate satisfaction for such patients without the need for dental implants.

Conflict of Interest: Nil.

Valuable Dental Materials from Salvadora Persica Plants

Salah A. Jassim[1], Kafa K. Hammud[2], Bassam Alsheekhly[3]

[1]Professor, College of Dentistry, Al Iraqia University, Baghdad, Iraq, [2]Research Scholar, Directorate of Materials Research, Ministry of Science and Technology, Baghdad, Iraq, [3]Tutor, College of dentistry, Al Iraqia University, Baghdad, Iraq

Abstract

Due to their popular uses, *Salvadora persica* (Miswak) plant possesses several bioactive effects and it is important to focus on their valuable effectiveness, especially on dental and oral health. The present review deals with many sections to obtain suitable knowledge about miswak such as chemical compositions, bioactivity, partitioning of active materials, method of obtaining miswak extract and the potent of this plant on dental and oral health according to their antioxidant, antifungal, antibacterial, antimicrobial, antiphlogistic, antimycotic, anticarcinogenic, anticandidal, anti-inflammatory and anti-plaque properties.

Keywords: *Miswak, Salvadora persica, compositions, bioactivity, dental.*

Introduction:

Salvadora persica L. (Miswak) is a tree from *Salvadoraceae* family, *Mongnoliopsida* Class naturally grown in the Saudi Arabia, Iran, India, and parts of Africa and are spread to all Islamic countries. By World Health Organization (WHO),it is considered as a safe tool for oral tooth hygiene. It has several known names derived from "Miswak" word like siwak, sewak, miswak beside arak[(1)].

Chewing sticks *of Salvadora persica* have different names in different languages, such as miswak, mastic, koyoji, in Arabic, Latin and Japanese languages respectively[(2)].

Miswak is a natural plant widespread and used as an effective oral hygiene tool depending on its chemical, medicinal, and mechanical characters[(3,4,5)]. Miswaq, arak or chewing sticks are different synonyms for a plant which was used before 7000 years ago by Babylonians, then Roman and Greeks followed by ancient Egyptians and millions of Muslims all over the word[(6)].

Active components in Miswak plant parts[(1,7)] are varied in their chemical formula, structure, concentration, action, extraction method, an others. They may be organic or inorganic, charged or neutral, water- or fat-soluble.

Miswak has antioxidant, antifungal, antibacterial, anti-inflammatory affects and it possess anti-plaque properties[(8,9,10,11,12,13)].

Summary from chemical, biological, and pharmaceutical notes: Extract of miswak exerts important medicinal activities depending on its chemical contents. It contains benzyl isothiocyanate, alkaloids, tannins, glycosides, terpenes, flavonoids, fatty acids, silicon, potassium, sodium, calcium, magnesium, manganese, phosphorus, fluorine, sulfur, and others (Figure 1). These active components may be ranged in their concentration reflecting environmental impacts on any plant especially natural one[(1,14,15,16)].

Aqueous extract of its root, stem, or leaf has an effective inhibition impact on some bacteria ranged from low to moderate, but not high antimicrobial response[(17,18,19,20)] as a result of presence several organic and inorganic compounds[(21,22,23)].

Anyplant part having various active components which are responsible of different influence upon specific biological problem[22,23,24,25]. Miswak used to treat diuretic, gastritis, anacylost-omiasis, gonorrhea, inflamm-atory, hypolipidemic, anti-pyretic, ulcers caused by alcohol or psychological stress, and hypoglycemic. Lowering chol- esterol plasma or oral *Candidiasis* of patient with renal transplant situation can be achieved with miswak using. Also, it possesses other important agents to treat analgesic, malaria, alexiteric, astringent, leucoder- ma, scabies, venereal, and other diseases. Miswak applications are in general in dental hygiene but it showed a noticeable influence in viral resistance, wound healing, antiphlogistic, anastringent, and antimycotic activities, gingiva,-stimulation and depressant activity[1.26,27,28,29,30,31,32,33,34,35,36,37].

Ahmad and Ahamed in their published article[28] reviewed miswak chemical contents and its actions in biological systems. Also, in this review[28] and other published papers researchers[25,27,30,32,34,36] ensured that miswak phytochemical contents varied from organic to inorganic materials with remarkable properties (Figure 1.). For example, they contain many elements support like silicon in the form of silicate providing the necessary strength to perform its mechanical action. Many fatty acids, polysaccharides, phenol and furan derivatives in lignins, thio- compounds, and sterols are presented in plants parts varied in their concentrations like palmitic acid, myristic acid, lauric acid, salvadoside, salvadoraside, salvadorine, trimethyl amine, sitosterol, liriodendrin, syringing, rutin, quercetin, different amide forms, ascorbic acid, β-sitosterol, mustard oil, tannins, saponins, beside high fluoride and chloride contents (Figure 1.)[25,27,30,32,34,36]. According to a published study, miswak root contains oil that may be obtained by steam distillation consisting of benzyl isothiocyanate as the major component beside flavonoids, α-pinene, and limonene[21]. Essential oil of this plant currently under review had a major content of benzyl thiocyanate and benzyl nitrile with less than 7% of benzaldehyde, carvacrol, aniline and naphthalene. Here, ascorbic acid (vitamin C) with thio – compound and all plant active components present a defense wall against bleeding, plaque, gingival bleeding and inflammatory actions[29].

Various studies showed the capability of miswak extract to form new composites having metal oxide or polymer with qualified properties differed from the original material. The properties of the obtained composites may have a raise in chemical, physical, biological, or mechanical characters. Miswak extract is considered as an effective substance when mixed with other materials to produce homogenized nanocomposite, confirming that this step is an eco-friendly method with good results comparing with the absence of extract use[38,39].

Benzyl thioisocyanate abbrev- iated by BITC is the main component in miswak and other plants with various biological activities and according to http://pubchem. ncbi.nlm.nib.govwebsite, BITC is used as food flavor with warning that it causes eye and respiratory irritation as a pure chemical.

Bioactivity of miswak: Evaluation of the biological effects of chemicalsis depend upon several factors such as chemical structure, biological target, concentration, physical conditions, pH, …etc.

For example, thiocyanate, nitrate, sulfate, or chloride ion that found in Miswak[40] influenced oxygen, some amino acid or monosaccharide transport, phosphorylation. Bacteria or virus can be inhibited by several mechanisms including enzyme action on sulfhydryl group and this group can be reacted with hypothiocyanite – Hydrogen peroxide catalyzed by lactoperoxidase[41,42,43]as shown in Figure 2. Hypothiocyanite anion production may be increased or inhibited with the presence of plant extract like miswak extract to control acid production effect on tooth. These anions may be released during hydrolysis with variation in concentration in all plant parts[44].

In biological systems, oxidation – reduction reaction may occur by the same starting materials with different products depending upon pH or enzyme. Glucosionlate group found in various plant families as a secondary products of metabolic pathways with three subgroups containing aliphatic α- amino acids, glucose, and sulfur atom[44].

Hydrolysis of this group is influenced by the pH factor producing nitrate, sulfate, and glucose at low pH while neutral condition give organic isothiocyanate compounds beside sulfate and glucose. Myrosinase enzyme catalyzes organic isothiocyanates to their alcohol and thiocyanate. These isothiocyantes act as signaling, anticarcinogenic, and detoxification molecules beside others biological actions[42,45,46,47,48,49].

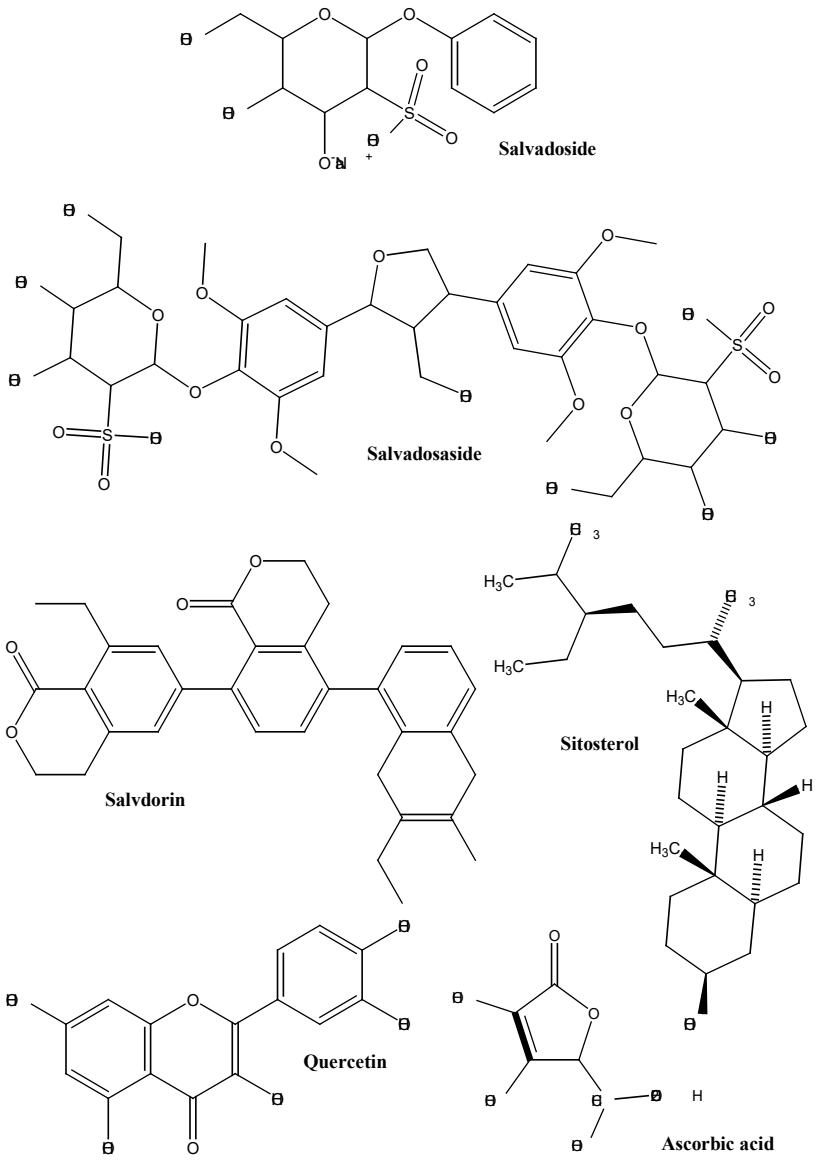

Figure 1. Chemical structures of several active components in miswak.

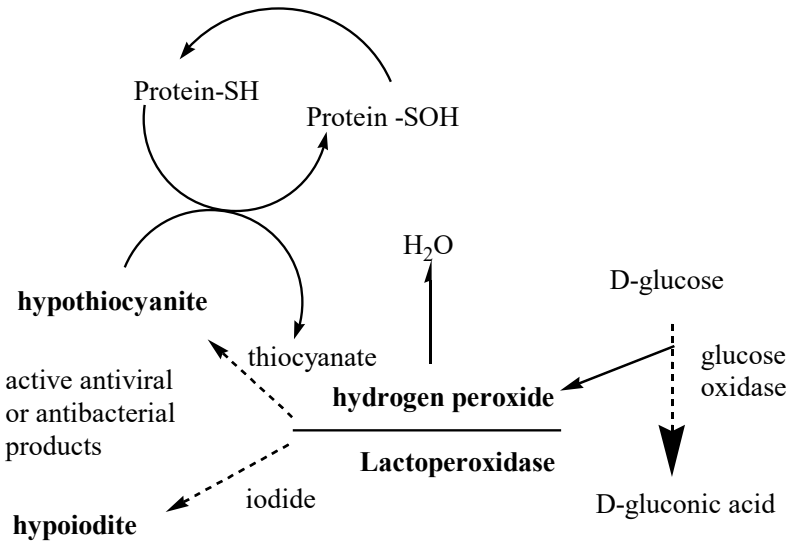

Figure 2. Antimicrobial products mechanism.

Nitrogen organic and inorganic components may be presented in any plant parts that may converted to another different compounds causing various effects depending upon their chemical structures and other factors. Oxidation – Reduction of nitrogen compounds like ammonia, urea, nitrate, nitrite, amino acid, peptide, protein, … etc. may result in ecosystem antimicrobial activity[50,51,52].

Organic and inorganic nitrogen – sulfur compounds in plants varied in their structures and functions in plants itself or in other biological systems[53,54,55,56,57].

Thiocyanate is one of these active acidic component found in various biological systems by being a part of human or enter human body through daily intake plants or animal products[58]. This important metabolism product utilizes several important actions even with its low concentration in human tear (150µM), human breast milk (100 nM), while cow milk (170 µM) through its bacteriostatic function. Accumulation of it leads to biological toxicity that can be lowered by renal elimination in human. Thiocyanate- hydrogen peroxide system catalyzed by peroxidase enzyme produces the antimicrobial agent (hypothiocyanous acid, HOSCN) that crosses cell wall of bacteria then reacting with sulfuhydryl (-SH), nitrogen, or selenium containing material to form (S-S), (S-O), (S-N), or (S-Se) bonds giving its antibacterial performance in many sites like oral cavity and saliva. This HOSCN may inhibit the growth of oral fungi or echovirus towards improving lung role[59,60,61,62,63,64].

In general, thiocyanate is less toxic than cyanide (CN^-) and it is eliminated by kidney. This toxicity did not prevent researchers from using thiocyanate as an oral under controlling dose to avoid sensitizing or suicide cases in Central Nervous, thyroid, skin, or renal system or any related toxicity of SCN^- as a metabolite of cyanogenic drug, dietary, or smoking[65,66,67].

Chlorine atom in its ionic form is another important micronutrient found in plant parts with biological importance even at low needed concentration[68]. It controls many activities in plant and other biological systems like electric charge balance, cell osmotic, enzyme, ionic, pH, and water regulations that contribute in other biological performances such as growth, ion – ion interchangeable operation, or disease resistance. Published articles confirmed that chloride ion can be replaced by other important anions (phosphate, sulfate, or nitrate). This replacement is with important influence because chloride accumulation causes salt stress and toxicity, especially in plants and microbiological systems[69,70,71].

The essential micronutrient (Cl^-) can be found in almost biological systems as a consequence of high solubility of its salts in water towards various maintaining functions[51,72] such as catalytic protein or enzyme activator in plant or animal, controlling carbon dioxide concentration in cell, oxygen role in photosystem II or redox processes, energy production and consuming, fungicide treatment, and anion : cation balance.

Bio- data showed that chloride ion have a noticeable cell membrane crossing of different bio-systems and this transportation can be done in cooperation with necessary cations and/or anions. This collaboration produces nitrogen fixation, photosynthesis of organic or inorganic nitrogen compounds towards effective regulation or accumulation between acidic and basic compounds or ions depending on required and/or produced energy for each process. These cooperative processes raise some important bio-functions like plant growth and production of active components or macromolecules for example in plant tissues[70,71,73].

In conclusion, all the mentioned activities of active components may be performed in the target bio-system or its production. So, these organic/inorganic active ingredients varied in their concentrations, extraction method, contributions with other ingredients, and applications. Their roles under question mainly based on structure, medium, and target. For example, chloride plays major role in cell expansion accompanied by other ions and organic molecules. Also, biological activity of any ingredient can be performed through enzyme catalysis that needs specific anion assistance. So, miswak have different active organic and inorganic compounds work together to achieve the biological actions.

Partitioning of the important chemical components in miswak[74]: Mohamed et al. (2018) was able to separate the active chemical compounds of miswak by cutting 1.1 kg of miswak roots to small pieces and treated them with alcoholic solvent (75% ethanol) by cold socking. After filtration step, the filtrate was concentrated under reduced pressure to obtain brown residue. To the dried extracts, 200 mL distil water and 400 mL petroleum ether was added. The upper layer (petroleum ether) was introduced into silica gel column

and n-Hexane-Ethyl acetate was used to elute the two compounds. Fractionation of compounds was carried out using 5% and 7% acetonitrile in water (H_2O:CH_3CN). Compound (3) was eluted by 5% and compound (4) eluted by 7%. The aqueous layer was treated with 150 mL 0.2N HCl and 300ml chloroform and shaken for 16 hrs. The chloroform layer was subjected to silica gel column and $CHCl_3$–MeOH was used as elution agent. 1% MeOH was used to elute compound (2) and 15% MeOH is suitable to elute compound (1).

Ammonium hydroxide was added to the aqueous layer until pH reach 11, then 400 mL of chloroform was added and mixed well.

Alkaloid Rich Fraction can be obtained by chloroform evaporation. After this fraction was subjected to column of silica gel, 78% MeOH in H_2O can elute compound (5), while compound (6) can be obtained by direct crystallization

From 1.1 kg of miswak roots, the above partition process can produce the following amounts:

8 mg *sulphur-containing imidazoline alkaloid (persicaline)* ***compound (4)***.

13mg *Benzyl-thiocarbamicacid-O-ethyl ester* ***compound*** **(3).**

30 mg hexadecanoic acid benzylamide ***compound*****(1).**

18 mg benzyl isothiocyanate ***compound*****(2).**

21 mg N-benzyl-2-phenylacet- amide ***compound*****(5)**

7 mg Benzylurea ***compound*****(6)**

Literature review of the method of obtaining miswak extract: The collected roots were washed, dried, and grinded to small size, followed by treating with 50% (v/v) ethanol in distill water by mixing the ratio of 1:10 root/solvent in dark space at 25C^o for 24 hr, then filter paper (Whatman No. 1442) used to filter the solution twice. The liquid concentrated by vacuum rotary evaporator at high temp, to get a dark brownish miswak extract[75].

Collected miswak were dried at the shade and then powdered by grinder to fine particles. Using soxhlet extractor, the powder was treated with different solvents such as methanol, ethanol and the mixture of both solvents. After drying step, the extracts were weighed in DMSO for antibacterial activity purpose[76].

Miswak were cutted into small pieces after washing step by distil water and kept 14 days at room temp. to be full dry. 100 g of dried miswak powder were mixed with either 1L of 95% methanol (as alcoholic solvent) or 1L distil water (as aqueous solvent). Filtration step were carried out using Whatman filter paper no, 1 and then the filtrates were concentrated using vacuum evaporator at 60 ^oC (for both water and alcoholic solvent). The extracts stored under -20 ^oC for the later use[77].

By tap water, roots of miswak were washed and then (300-400) g in 1500 mL 80% ethanol were dissolved for 0.5 hr. at 80 ^oC. The filtration step was carried out using cotton wool. To be sure for complete extraction, the residue was dissolved again in 1 L of the same solvent for 5 min. using water bath at boiling point degree and kept overnight to be filtered again by a cotton wool. Both filterates (step 1 and 2) were mixed and concentrated by rotary evaporator at 40 ^oC. The produced extracts were stored at -80^oC[78].

After drying the miswak plants for 10 days at room temperature, they were cutted by Omni mixer to small parts. 20 grams of the dried powder were mixed with 100 mL of deionized water and kept to soak at 4^oC for 24 hrs. and then centrifuged at low temperature (4^oC) and then filter the supernatants by very small pore membrane (0.45 μm) membrane. finally, freezedried was carried out to get dry miswak.

Saleh et al. used different types of solvents such as acetone, ethanol, methanol (all were 80 percent in water) in addition to distilled water where percent of miswak to solvent was (1:10, wt/v). After filtration step, the extracts were concentrated by vacuum evaporator[79].

Chevalier (2003) use modified procedure to obtain miswak extracts. After cutting the sticks of miswak to small pieces, food blender was used to ground the pieces to powder. Sterile hot distilled water was added to miswak powder with 1:10, wt/v (miswak:water) and left to sock at 37^oC for 48 hrs. then the mixture was filtered by 0.45 μm pore filter paper. Drying of the extracts was established by incubation system at 37^oC. The final extracts were stored at *sterilized* vials in refrigerator system[80].

Firas et al. used soxhlet extractor to recover *Salvadora persica L.* by methanol solvent for 10 hrs.

The experiment still continued until the solvent became colorless. Rotary vacuum evaporator was used at 40 ºC to concentrate the extracts and kept store until use[81].

Darmani et al. mixed 1.5:10 w/v of miswak powder: sterile water for 48 hrs. at 4ºC after drying the fresh sticks at room temperature for 2 days, (miswak powder was obtained using ball mill). The treated material was centrifuged and filtered by 0.45 µm pore filter paper[82].

Miswak as potent dental materials: The *Salvadora persica* (the scientific name for Miswa)" has great beneficial effects on the oral cavity, like the silica and sodium bicarbonate which are constituents of miswaq,work as abrasive materials, reduce the tooth stains and improve its whiteness[83].

Plaque and gingivitis usually reduce in Miswak users due to the "Tannic Acid" which is an astringing material[84,85].

Other constituents can protect the tooth enamel by a layer of resin, while alkaloid has a bacteriocidal effect[86,87], supported by sulfur present in *Salvadora persica*[88].

Calculus formation usually inhibited by high concentration of chlorine[87].

Inhibition of demineralization and promotion of remineralization is achieved due to the calcium saturation of saliva of Miswak users[89].

Benzylisothiocyanate (BITC), one of the S. Persica root showed a virucidal activity specially against herpes simplex, also it can inhibit the growth of *Streptococcus mutans*, as many reports support its fungistatic action against *Candida albicans*[90,91,92].

Depending on significant effects of Miswak extracts against the oral cavity pathogens, it is recommended to use Miswak as a dental hygiene method to prevent tooth caries.

High concentrations of Miswak extract works as good as chemical oral disinfectant (e.g. Triclosan and chlorhexidine) showing antibacterial actions[4,89,90,91,92,93,94]. Also Alcoholic and aqueous extract of *S. persica* showed anticandidal activity[93,95].

Different investigations showed significant inhibition of the growth of different oral pathogens like *Candida albicans* and *actinomyces naeslundii*[91].

Himawan H. etal. observed that Miswakis more potent than ordinary toothpaste in its ability to reduce the amount of plaque accumulation in fixed orthodontic. Two groups (20 patients for each group) were examined, 95% reduction in the plaque score was recorded when Miswak is used, against 65% reduction in the ordinary toothpaste[96].

Almas K. studied the effect of miswak and Chlorahexidine Gluconate (CHX) on the removal efficiency of smear layer. He recorded that miswak was more potent than CHX to remove the layer. He also observed that dentinal tubules were more opened in both etched (periodontal and healthy dentin)[97].

Organic acids are produced due to the fermentation of sucrose which is metabolized by biofilm bacteria resulting in decrease the plaque pH which causes dental caries according to Stephan curve. Lower pH can demineralize the enamel and cause caries. Because of strong taste of miswak, rinsing with its extract increases salivary flow and secretion from parotid gland which leads to raise the pH plaque after half hr. and prevents dental caries[98].

Mixture of miswak (3.5%) and monofluorophosphate (0.8 %) enhance significantly the plaque reduction and improve the gingival index[99,100].

Conclusion

Miswak (as chewing sticks) is one of the most popular important herbs used for *good dental health due to its active chemical components which are considered the main keys of the potent bioactive properties that relate* to its therapeutic characteristics. Miswak is considered (by World Health Organization/WHO) as a safe tool for healthy tooth. Anti-plaque properties of miswak is very significant to prevent dental caries. Antioxidant, antiphlog- istic, anticarcinogenic, antifungal, antimicrobial, antibacterial, antimycotic, and anticandidal behaviors of miswak represent the real reasons of its therapeutic characteristics for oral tooth health.

Serological Tests Assessment in Patients Suspected to have Celiac Disease Attending the Gastroenterology and Hepatology Teaching Hospital in Baghdad

Samer Nema Yassen Alkemawy[1], Shymaa Nema Hamed Alsaltani[2]

M.B.Ch.B, D.M, F.I.B.M.S (Internal Medicine), F.I.B.M.S (Gastroenterology & Hepatology), Lecturer, Iraq/ University of Kufa/College of Medicine, [2]M.B.Ch.B, F.I.B.M.S (Family Medicine), Family Physician Specialist, Iraq/Ministry of Health/Najaf Health Circle

Abstract

Background: Celiac disease is characterized by small intestinal malabsorption of nutrients after the ingestion of wheat gluten or related proteins from rye and barley, villus atrophy of the small intestinal mucosa, prompt clinical and histologic improvement following strict adherence to a gluten-free diet, and relapse when gluten is retaken.

Aim of the Study: Evaluation of patients seeking gastroenterology and hepatology teaching hospital/medical city/Baghdad with suspected celiac disease regarding serological investigation, histological findings and genetic testing, to determine sensitivity, specificity, positive predictive value and negative predictive value for every test.

Patients and Method: The study is a cross sectional descriptive analytic study conducted at the teaching hospital of gastroenterology and hepatology/Baghdad/Iraq during a period from the 1st of February 2018 to the 1st of April 2019. After thorough history and Clinical examination patients with suspected celiac disease were sent for serological investigation (TTG IgA and IgG), (antigliadin IgA and IgG), all patients were sent for endoscopic examination for duodenal biopsies with subsequent histological assessment. Patients who failed to be confirmed (positive serology and negative histology or vice versa) were sent either for HLA genotyping or for IgG Deaminated gliadin peptide. Sensitivity & specificity were measured for each test.

Results: A total of 140 suspected celiac disease patients involved in this study. Mean age was 18.9 years and ranged from 2 years to 60 years. Male represented 36.4% of the cases while female represented 63.6%. Only 19 patients show positive family history of celiac disease (13.6 %). Regarding associated autoimmune diseases, the majority (111 patients) have no associated diseases (79.3%) while the other patients who have associations most of them show positive association with type 1 DM (16.4%).

Fifty patients (35.7%) presented with short stature, (25.7%) came with diarrhea. The other symptoms vary between bloating and distention, unexplained anemia and weight loss. Constipation was seen in one patient. tTG IgA and tTG IgG showed high sensitivity, specificity, positive predictive value and negative predictive value while antigliadin antibody failed to show these significant results.

Conclusion: The use of serologic markers in celiac is easy, direct, noninvasive and reliable and could be benefit in the diagnosis and monitoring of the disease. More specifically, both the tTG-IgA/IgG are very good markers in the diagnostis of CD. This study confirmed the high specificity and sensitivity of tTG, and

the low results of AGA, but celiac serology does not replace the biopsy in the diagnosis but is useful as an assistant for diagnosis.

Keywords: *Celiac Serological Tests, Transglutaminase Antibody, Antigliadin Antibody, Deamidated Gliadin Antibody, Antiendomysial Antibody, HLA DQ2/DQ8, Marsh Classification, Duodenal Biopsy, Villous Atrophy, Chronic Diarrhea, Malabsorption, Gluten*

Introduction

Definition: Celiac disease is characterized by small intestinal defect of absorption of nutrients after the taking of gluten or proteins from rye and barley, small bowel mucosal villus atrophy, prompt clinical and improvement in histology after adherence to a gluten-free diet, and relapse when gluten is retaken again.[1,2,3].

Classification:[4,5, 6]

Classic disease —

Atypical celiac disease —

Silent celiac disease —

Latent celiac disease —

Who should be tested?

Testing for celiac disease should be considered in the following patients[2,7]:

- Gastrointestinal symptoms
- Extra intestinal signs and symptoms such as iron deficiency anemia, folate or vitamin B12 deficiency, persistent elevation in serum aminotransferases, short stature, delayed puberty,
- Patients with type 1 diabetes mellitus
- Asymptomatic first-degree relatives.

Serum Antibody Assays:

A variety of serologic studies have been described to aid in the diagnosis of celiac disease, including:[8,9,10]

- EMA IgA
- tTG IgA
- tTG IgG
- DGP IgA
- DGP IgG

Anti-tissue transglutaminase antibodies: The antigen against which antiendomysial antibodies are directed is tissue transglutaminase-2 (tTG)[11]. Anti-tTG antibodies were highly sensitive and specific for the diagnosis of celiac disease in most reports[12,13,14].

The accuracy of IgA anti-tTG has been improved more by the use of human in place of the non-human tTG used in earlier kits [15].

Antigliadin Antibody Assays: Antigliadin antibody (AGA) tests are not recommended due to their low positive predictive value in a general population [16,17]. The second generation AGA test (deamidated gliadin peptide [DGP]) uses synthetic gliadin peptides that mimic tTG-modified gliadin sequences to capture serum IgA or IgG against DGP [9, 10]. Anti-DGP assays are preferred over anti-AGA due to their higher specificity.

Patients on a gluten-free diet with negative serologies should undergo HLA DQ2/DQ8 testing to determine if the patient is genetically susceptible to celiac disease. If HLA DQ2/DQ8 testing is negative, celiac disease is excluded [17].

Small Bowel Biopsy: Patients with a positive serology, and patients with a high probability of celiac disease (>5 percent), regardless of the serology, should undergo an upper endoscopy with small bowel biopsy to confirm the diagnosis of celiac disease.[18] The mucosa of duodenal wallmay appear atrophied with loss of folds, have a nodular appearance or the folds may be scalloped, but such findings are not always present and may be seen with other causes[19][20]. The histologic features range from a mild alteration characterized only by increased intraepithelial lymphocytes (IEL), to a flat mucosa with complete loss of villi, enhanced epithelial apoptosis, and crypt hyperplasia [4,6,21]. The histologic findings in celiac disease can be described using the Marsh-Oberhuber[22]. Quantitative histology (villous height, crypt depth, density of IELs per 100 enterocytes) provides the most sensitive and accurate method to monitor disease activity over time[23,24].

Suggestive clinical features but negative serologic tests:

There are four main possibilities in those with suggestive clinical features but negative serologic tests:[25,26,27,28]

- IgA deficiency. In such patients, testing for IgG deamidated gliadin peptide antibodies should be performed. Other, less accurate, IgG-based tests include IgG anti-tissue transglutaminase antibodies
- Low gluten diet.
- Falsely negative. IgA or IgG deamidated gliadin peptide antibody testing may be useful.
- Irritable bowel syndrome, nonceliac gluten sensitivity

Materials and Method

Participants and study design: This study was a cross sectional descriptive analytic study conducted at the teaching hospital of gastroenterology and hepatology/ Baghdad/Iraq during a period from 1st of February 2018 to the 1st of April 2019.

Subjects and sampling method: After thorough history and clinical examination of the patients referred to the hospital due to variable clinical symptoms and signs compatible with coeliac disease, subjects were recruited according to convenient sampling method and a convenient sample of 140 patients was studied which were sent for serological investigation (TTG IgA and IgG), (AGA IgA and IgG), all patients were send for endoscopic examination for duodenal biopsies with histological assessment. Patients who failed to be confirmed were sent either for the new test IgG DGP or for HLA genotyping.

Inclusion Criteria:

1. Chronic diarrhea or loose stools.
2. Abdominal pain, abdominal distention and flatulence not responding to medication.
3. Malabsorption and steatorrhea.
4. Unexplained Wt. loss.
5. Failure to thrive.
6. Unexplained anemia.
7. At-risk family members

Exclusion Criteria:

1. Crohn´s disease
2. Chronic liver disease
3. H.pylori gastritis,Peptic ulcer duedenitis
4. Giardiasis
5. Malnourished patients due to chronic debilitating disease

Blood Sample: The sample was then analysed for TTG, antigliadin, Some of the patients who showed discrepancy of their results were sent for IgG Deaminated Gliadin peptide in the Central Health Laboratory in Baghdad or for HLA test in the teaching hospital of Alkarama in Baghdad.

Serological Tests: Serum tTG and AGA performed by ELISA based to the manufacturers.

Genotyping: Coeliac disease-associated HLA genotyping was performed in Alkarama hospital in Baghdad by specialized lab.

Upper gastrointestinal endoscopy: Upper gastrointestinal endoscopies with duodenal biopsies were offered regardless of serology results by specialized gastroenterologist.

Histology: Biopsies were interpreted in the pathology department in the gastroenterology and hepatology teaching hospital by specialized pathologist to read the small intestinal histological features, according to the modified Marsh criteria:

The reference standard for celiac disease diagnosis was considered Marsh grade ≥2.[29]

Ethical Aspects: The Institution's Ethical Committee approval was obtained prior to the enrolment of subjects.

Statistical Analysis: Data were analyzed by the statistical package of social sciences version 25. Statistics of the variables was expressed as medians, ranges, frequencies and percentage, as appropriate and calculated by chi-squared test. Odds ratio (OR) and the 95% confidence interval of OR were calculated, Level of significance of ≤ 0.05, considered as significant difference or association.

Results

tTG IgA Serology: From the patients who were found to be marsh 0 or 1, only 2 patients tested positive for TTG IgA those was sent for IgG DGP or HLA and the results was negatives and so they are regarded as (false positives) while 48 patients tested negative (true negatives). From the patients who were found to be marsh 2 or 3, 84 patients tested positive for TTG IgA (true positives) while only 6 patients tested negative those was sent for IgG DGP or HLA and the results were positives and so they are regarded as (false negatives). From these results we concluded that sensitivity, specificity, PPV and NPV of **TTGIgA** were 93.3%, 96%, 97.6% and 88.8% respectively (Table 1).

Table 1: Sensitivity, specificity, PPV and NPV of TTG IgA

		Histology			
		Marsh 2, 3a,3b and 3c	**Marsh 0,1**		
TTG IgA	Positive	84	2	Sensitivity	93.3 %
				Specificity	96 %
	Negative	6	48	Positive predictive value	97.6 %
				Negative predictive value	88.8 %

tTG IgG Serology: From patients with marsh 0 or 1 only 4 patients tested positive for TTG IgG so some of those was sent for IgG DGP and another for HLA and the results was negative and so they are regarded as (false positives) while 46 patients tested negative (true negatives).

From the patients who were found to be marsh 2 or 3, 85 patients tested positive for TTG IgG (true positives) while only 5 patients tested negative and those was sent for IgG DGP or HLA and the results were positive and so they are regarded as (false negatives). From these results we concluded that sensitivity, specificity, PPV and NPV of **TTG IgG** were 94.4%, 92%, 95.5% and 90.1% respectively (Table 2).

Table 2 Sensitivity, specificity, PPV and NPV of TTG IgG

		Histology			
		Marsh 2, 3a,3b and 3c	**Marsh 0,1**		
TTG IgG	Positive	85	4	Sensitivity	94.4 %
				Specificity	92 %
	Negative	5	46	Positive predictive value	95.5 %
				Negative predictive value	90.1 %

Antigliadin IgA Serology: From the patients who were found to be marsh 0 or 1, 13 patients tested positive for antigliadin IgA those was sent for IgG DGP or HLA and the results was negative and so they are regarded as (false positives) while 37 patients tested negative (true negatives). From the patients who were found to be marsh 2 or 3, 33 patients tested positive for antigliadin IgA (true positives) while 57 patients tested negative those was sent for IgG DGP or HLA and the results were positive and so they are regarded as (false negatives). From these results we concluded that sensitivity, specificity, PPV and NPV of **antigliadin IgA** were 36.6%, 74%, 71.7% and 39.3% respectively (Table 3).

Table 3: Sensitivity, specificity, PPV and NPV of antigliadin IgA

		Histology			
		Marsh 2, 3a,3b and 3c	**Marsh 0,1**		
Antigliadin IgA	Positive	33	13	Sensitivity	36.6 %
				Specificity	74 %
	Negative	57	37	Positive predictive value	71.7 %
				Negative predictive value	39.3 %

Antigliadin IgG Serology: From the patients who were found to be marsh 0 or 1, 7 patients tested positive for antigliadin IgG those was sent for IgG DGP or HLA and the results was negative and so they are regarded as (false positives) while 43 patients tested negative (true negatives). From the patients who were found to be marsh 2 or 3, 22 patients tested positive for antigliadin IgG (true positives) while 68 patients tested negative those was sent for IgG DGP or HLA and the results were positive and so they are regarded as (false negatives). From these results we concluded that sensitivity, specificity, PPV and NPV of **antigliadin IgG** were 24.4%, 86%, 75.8% and 38.7% respectively (Table 4).

Table 4 Sensitivity, specificity, PPV and NPV of antigliadin IgG

		Histology			
		Marsh 2, 3a,3b and 3c	**Marsh 0,1**		
Antigliadin IgG	Positive	22	7	Sensitivity	24.4 %
				Specificity	86 %
	Negative	68	43	Positive predictive value	75.8 %
				Negative predictive value	38.7 %

Discussion

Celiac disease is a common disorder, which affects 1% of individuals [30]. There aremany disorders, with environmental and genetic effects contributing to the etiology of celiac disease [31]. HLA locus is the main influence affect celiac disease [32].

In the present study age distribution of cases showed that celiac disease is more in children than in adults. as shown in table 2 which show that from 90 patients who are proved to be celiac disease the frequency of children is 64 patients versus only 26 adults so that, the results of this study are similar to results that obtained by other researchers, especially with results of AL-Kenzawi, when he showed that children account a large number of celiac patients in Iraq countary[33].

Also these results come in agreement with the results of Al-Saadi and Abid, when they studied patients with celiac disease in Karbala and showed that 64% of patients were children [34] and the results of another study which took 509 patients referred to the immunology department in Baghdad teaching labs and showed that large number of CD cases were children [35].

In general CD in children is more than other ages, might be attributed to introduction of large amount of gluten or exposure to the gluten without breastfeeding might increase the risk of CD in children [36], or might be due to other factors such as infections [37].

In the present study Gender distribution of cases showed that the majority of cases that are proved to be celiac disease were females (72.2 %) and the remaining (27.7 %) were males as shown in table 2 so that, this agrees with Green, when he reported that CD was 2 to 3 times higher in females [30]. Also, agrees with results of Fasano A [38] and Giorgio F [39] showed that the prevalence of celiac disease is 1.5 to 2 times higher in females.

In general, some genetic loci are related to sex, also sex-dependent HLA associations are seen because

female patients are carry DQ2 and/or DQ8 molecules while DQ2/DQ8 negative celiac mostly are males [40], or role of sex hormones in immune regulation which may explain sex varieties [41].

In the present study significant numbers of CD patients have positive family history and this agrees with the results of Vitoria JC showed that the risk of having CD is higher in siblings than in parents of patients with CD[42] and agree with the research done India showed that CD prevalence among first-degree relatives was 8.2% (14/169). CD prevalence between siblings is (15.6%) [43].

CD Prevalence in the first degree relatives vary between 2.8% to 8.2% [42]. The variability can be clarified by study the methodology and the differences of the genetics of the studied population. It is mentioned that this prevalence increases in families with two or more cases of CD [44].

The present study shows significant association between type 1 DM and celiac disease and this comes in agreement with the results of other research that done in British Columbia who confirmed the prevalence of CD in diabetes type one [45] and come in agreement with other research done in Iraq showed that the proportions of patients with CD and type one diabetes who were positive for antigliadin IgA and IgG, tTG IgA IgG were 20%, 23.53%, 20% and 24.71%, respectively, which were higher than those of control subjects significantly[46]

Conclusion

- Celiac serology does not replace small bowel biopsy in the diagnosis of celiac disease but is useful as an adjunct to biopsy.
- Serological tests are easy, noninvasive and are benefit both for diagnosis and monitoring.
- The study showed the high sensitivity & specificity of tTG, and the low results of the AGA.

Abstract

Background: Diabetic cardiomyopathy is one of the serious complication of diabetes mellitus, with a silent development and it is often underestimated, Currently available diagnostic techniques are limited in their ability to identify patients who present with uncommon symptoms or silent myocardiopathy in its early stages.

Aim: To evaluate role of miRNA-378 compared to GLS as a sensitive biomarker for early detection of subclinical diabetic cardiomyopathy.

Method: This case control study involved 75 DM2 patients from Merjan Medical City in addition to age and sex-matched 25 apparently healthy subjects . The echocardiographic assessment for GLS was done for control group (H) and normotensive diabetic patients and these patients were divided into (CD) group without cardiomyopathy, and (M)group with cardiomyopathy diagnosed by negative GLS and positive GLS, respectively. Group (F) include Hypertensive and/or ischemic diabetic patients with overt heart failure . conventional Echocardiography was performed to all patients and control groups, all of them were of normal EF, except group F who have EF less than 40%. Bloodsampling was done for all and miRNA extraction and analysis done according to the manufacturer recommendations.

Results: There is significant elevation in miR-378 Ct value between H in one side & other three diabetic gps. (CD, M, F) as presented in table (3-17) ($p< 0.05$). There is significant elevation in miR-378 Ct value in M than CD groups. There is significant elevation in Ct value in F than M gp. ($p=0.000$). In the ROC curve (AUC) was 0.965. The sensitivity and specificity were 0.978 and 0.646, respectively according to the chosen cut-off value.

Conclusion: This study showed that miRNA-378 could be regarded as a novel sensitive biomarker which could play a significant role for early detection of subclinical diabetic cardiomyopathy.

Keywords: *Diabetic cardiomyopathy, screening, GLS, sensitivity, miRNA-378.*

Introduction

Diabetic cardiomyopathy was first described by Rubler in 1972[1,2]. The term describes several mechanisms involved in the pathogenesis of this entity including changes in myocardial structure and metabolism that are not directly attributed to other co-morbidities such as coronary artery disease (CAD) or hypertension. Left ventricular hypertrophy, myocardial lipotoxicity, increased oxidative stress, cell death from apoptosis, impaired contractile reserve, altered substrate utilization as free fatty acids (FFA), mitochondrial dysfunction and fibrosis are among the mechanisms involved with these changes in structure and metabolism contributing to the progression of heart failure[2]. In particular,

fibrosis is one of the abnormalities that can be evaluated with the newer imaging techniques. Cardiac magnetic resonance (CMR) is the gold standard in the assessment of myocardial fibrosis given that T1 sequences separate normal from fibrotic tissue[3]. Nonetheless, CMR is not widely available, and it is time and cost consuming with longer and exhausting protocols. Speckle tracking echocardiography has been validated against magnetic resonance imaging[4,5]. Global longitudinal strain (GLS) is the simplest deformation parameter specified by Speckle tracking echocardiography and probably the closest to routine clinical application[6]. Quantitative assessment of myocardial function is now possible with this technique[7]. Routine use of Speckle tracking echocardiography in daily clinical practice is not cost-effective in this scenario and currently impractical for large-scale population screening. Therefore, assessment of individual risk factors becomes very important in clinical practice especially in primary care settings. More than half of patients with heart failure have preserved ejection fraction (HFpEF) [8].Monitoring of the serum biomarkers such as brain natriuretic peptide (BNP), cardiac troponins and MMPs is a cornerstone of clinical management of DbCM. However, these markers are expressed in <60% of cases, In several studies, BNP proved to be a suboptimal screening test to detect pre-clinical LV dysfunction or LVH [9, - 11]. For all these reasons novel sensitive markers are needed. Although many substances have been suggested as biomarkers for DbCM, none have qualified for clinical use. Diagnosis and therapies are difficult because of a lack of specific biomarkers and imaging techniques. There is a need to anticipate the progression of heart failure in patients with diabetes and for that reason we propose a strategy of non-invasive analysis of inflammation-fibrosis LVD. The detection of appropriate biomarkers could potentially permit routine population-wide screening, allowing early diagnosis and anticipation of cardiac dysfunction,and stratify these subclinical cases[12, 13]. MicroRNAs (miRNAs) are short noncoding RNAs that modify gene expression by regulating mRNA stability or translation during various disease processes. Each mRNA regulates expression of multiple genes. Dysregulated miRNAs are potentially involved in the pathogenesis of DbCM [14]. There are multiple miRNAs that have been implicated with the progression of disease. After release from the cell, these molecules remain stable in extracellular fluids and can be measured by quantitative polymerase chain reaction (qPCR)[15]. Clinical studies have proposed peripheral blood microRNAs (miRNAs) as sensitive, specific and non-invasive biomarkers for the early monitoring of alterations in cardiac viability, structure, and function. Distinctive circulating miRNA signatures with clinical value have been described in various cardiomyopathies and type 2 diabetes and its related vascular complications[16]. miRNA-378 has emerged as a new biomarker in diabetic heart failure and has a strong relationship with inflammation and fibrosis [17]. The goal of the present study was to evaluate the usefulness of miR-378, as aserum biomarkers of DbCM in an unselected patient sample. To determine whether this miRNAs would be equally appropriate as serum biomarkers, it was tested in this study in a group consisting of 75 diabetic patients. The utility of that miRNA as a serum biomarker was evaluated by comparing its sensitivity to that of GLS.

Subjects, Materials and Method

Subjects: From May 2018 to April 2019, a total of 75 patients with DM2 and 25 control subjects who were aged 40–65yr were prospectively enrolled from Diabetic Center, CCU, and Echo Unit in Merjan Medical City (M.M.C.) admitted as diagnosed cases of DM2 by expert physicians. Each 25 patients group has a definite characters as in table (1).

Table (1): Diagnostic criteria of study groups

CD group	Normotensive diabetic patients without cardiomyopathy diagnosed by negative strain echo study
M group	Normotensive diabetic patients with cardiomyopathy diagnosed by positive strain echo study
F group	Hypertensive and/or ischemic diabetic patients with heart failure diagnosed by conventional echo study
H group	Apparently healthy subjects with negative strain echo study

Clinical Evaluation: All subjects underwent a questionnaire include: medical history which involve: history of DM2 and its duration, ischemic heart disease, hypertension, family history of DM2, medications already taken and alcohol consumption history. Previous history of ischemic heart disease (IHD) was considered

positive if there was any history of admission to CCU with records by physician suggestive of IHD. The absence of ischemia and structural abnormalities was verified in groups M, CD, and H. Nonischemic is defined by normal resting ECG and negative stress ECG test. Structural abnormalities were excluded by normal resting conventional echo study having EF% >50%.

The questionnaire includes also socio demographic measures involving: age, gender. In addition to those the questionnaire includes anthropometric measures involving BMI which was calculated from the measured height and weight and categorized into the following categories: normal BMI <25, over weight BMI (25-29.9) and obese ≥30 kg/m^2. All were subjected to clinical examination including, heart rate and blood pressure. Further clinical details are shown in Supplementary Table (2).

Table (2): Clinical data for patients in all study groups and control subjects

Variables		Groups			
		CD group	M group	F group	H group
Total number (n)		25	25	25	25
Age/Mean±SD		52.76±6.3	53.04±6.2	58.44±5.9	50.88±8.1
Gender	Male	14	15	18	17
	Female	11	10	7	8
BMI (Kg/m^2)/Mean±SD		26.4±4.1	32.1±5.3	30.6±3.5	29.2±5.9
Family history of DM2	+ve	19	17	18	4
	-ve	6	8	7	21
HbA1c%		8.5±2.3	8.9±2.3	9.1±2.2	4.4±0.27

Method

Echocardiography: The gold standard biomarker of diagnosis was GLS% which was defined as the average longitudinal strain at end-systole in 18 segments. By regarding cut-off value of GLS = -18% according to (Islam E. Shehata et al[18] who reported that a GLS cutoff of<−18.1% was able to accurately "predict subclinical LV systolic dysfunction".

Strain echocardiography: Speckle tracking strain mode was selected on the echo-machine during apical 4, 2 and 3-chamber imaging and three consecutive cycles were recorded at a frame rate of 60 to 80 frame/sec. The LV is divided into 6 walls (inferoseptum, lateral, anterior, inferior, posterior and anteroseptal walls) every wall is divided into basal, mid and apical segments except the anteroseptum and posterior wall divided into basal and mid segments only, the global PSLS value for each participant were calculated as the average of values of the 16 segments[18].

The adequacy of the tracking was verified visually, and if tracking was deemed suboptimal, a manual adjustment of both the endocardial and epicardial border was performed. If tracking was still judged unsatisfactory, the subjects were excluded from the analysis. Strain curve were extracted from an average of three cycles of tissue Doppler imaging data, using an IBM computer and developmental software (Formtest V6.1; GE Vingmed).

Blood collection and Laboratory method: Venous blood was acquired by venipuncture without anticoagulant treatment. Samples were centrifuged and subsequently aliquoted and stored at −80 °C prior to analysis. For RNA isolation, an miRNeasy Mini Kit (Sigma/USA) was used to extract total RNA from 500 µl of serum. Reverse transcription (RT) was performed using a TaqMan MicroRNA Reverse Transcription Kit (Sigma/USA). The RT product was preamplified, and level of miR-378-5p (assay MIRAP00354) were measured by qPCR using a TaqMan miRNA assay (Applied Biosystems).miRNA species with CT value ≥35 were considered below the detection threshold. The serum miRNA expression levels in individual samples were determined by a TaqMan probe-based RT-qPCR

on a 7300 Real-Time PCR Sequence Detection System (Applied Biosystems). Because U6 and 5S rRNA are degraded in serum samples and the lack of a consensus housekeeping miRNA for the RT-qPCR analysis of serum miRNAs, miRNA expression was normalized to serum volume [19]. For serum and exosome samples. Influence of haemolysis was discarded by analysing the Ct values of miR-23a and miR-451a[20].

Statistical Analysis: Statistical analysis was performed using SPSS version 20. Data were expressed as (mean ± SD). ANOVA test was used to compare means of more than 2 groups. P values less than (0.05) were considered significant. Receiver operating characteristic (ROC) analysis was performed to evaluate the discriminatory power of the markers analyzed. We chose Ct = 20.06 as the cutoff value to evaluate sensitivity and specificity of miRNA-378 in this study.

Results and Discussion

The difference in miRNA-378 circulating level in different study groups: There is significant elevation in the Ct value of miR-378 with the progression of the diabetic cardiomyopathy as presented in table (4) indicating its down regulation as the disease progress. This result agreed with (Rui Guo et al) who classify miR-378 as anti-hypertrophic miRNAs as it is downregulated with the development of DbCM[21].

This result disagreed with (Sarah Costantino,) who stated that miR-378 is one of key initiators of apoptosis, were significantly overexpressed in the diabetic heart and intensive glycemic control was unable to revert these changes [22]. The complex biology of miRNAs may also influence the respective findings. The miRNA profile of a given cell is highly specific to the stressor which it is exposed and suggests that miRNA expression in the human heart is dynamically regulated as a function of the pathophysiological context [23].

There is significant elevation in miR-378 Ct value between H & other three diabetic gps. (CD, M, F) as presented in table (5) $p<0.05$; which represent its relevance to DM2. This result agreed with (Ivana Knezevic et al) who reported that in tissues such as fibroblasts and fetal hearts, where insulin-like growth factor receptor-1(IGF1R) levels are high, we found either absent or significantly low miR-378 levels, suggesting an inverse relationship between these two factors [24]. IGF-R are hybrid receptors which are more abundant when insulin receptors are down-regulated in response to the hyperinsulinemia as seen in insulin-resistant patients with DM2 as stated by Liam J. Murphy[25] Also it agreed with (Assmann et al [26]) who stated that it is downregulated with DM2. miR-378 down regulation relevance to DM2 approved by (Yong Zhang et al[27]) when they found that Tg mice had a significant overall increase in body O_2 consumption, CO_2 production, and energy expenditure.

The significant elevation in miR-378 Ct value in M than CD groups indicate its downregulation with the development of cardiomyopathy in its subclinical state as that miR-378 downregulated in case of hypertrophy development and oxidative stress increase [28]. These findings confirm the potential role of these modulators in identifying DbCM in relevance to their role in mitochondrial metabolism of cardiomyocyte via FoxO-1 as presented by (Puthanveetil, P.[29]) who stated that overexpression of FoxO1 mimics a hyperglycemic effect on vascular endothelium and also that hyperglycemia-induced endothelial dysfunction is mediated through FoxO1. miR-378 mimics reduced Akt phosphorylation also resulted in decreased phosphorylation of FoxO1, ultimately leading to FoxO1 activation. This effect was also perceived in a H2O2-induced oxidative stress model in rat cardiomyocytes. So downregulation of miR-378 resulted in increased expression of FoxO1which resulted in mitochondrial dysfunction trigger cardiac cell death in diabetic heart disease.

There is significant elevation in Ct value in F than M gp. ($p=0.000$) which indicate more downregulation of miR-378 in F gp. than M gp.as presented in table (5). This lower expression may be due to different pathophysiological background related to hypertension & ischemia as concluded by (Jan Fiedler et al[30]) who published that presence of miR-378 attenuated ischemia-induced apoptosis by inhibiting caspase-3 expression in cardiac myocytes and blunted cardiac hypertrophy and dysfunction upon cardiac overload by targeting Ras signaling. So may be the ischemic hypertensive metabolic changes resulted in downregulation of miR-378.

Table (4) ANOVA–All Groups with Ct of miR-378

Descriptive				
Ct of miR-378				
Groups	Mean	Std. Deviation ±	95% Confidence Interval for Mean	
			Lower Bound	Upper Bound
CD	19.6	2.1	18.80208	20.54192
F	30.4	3.4	28.97827	31.89006
H	17.6	2.9	16.30735	18.89526
M	25.9	3.4	24.39589	27.45138

Table (5): Comparison between groups

Multiple Comparisons					
Dependent Variable: Ct of miR-378					
LSD					
Groups		Mean Difference	p-value	95% Confidence Interval	
				Lower Bound	Upper Bound
H	CD	-2.070	.020	-3.80996-	-.33143-
	F	-12.832	.000	-14.58941-	-11.07632-
	M	-8.322	.000	-10.11752-	-6.52714-
M	CD	6.251	.000	4.49190	8.01137
	F	-4.510-*	.000	-6.28734-	-2.73372-

*The mean difference is significant at the 0.05 level

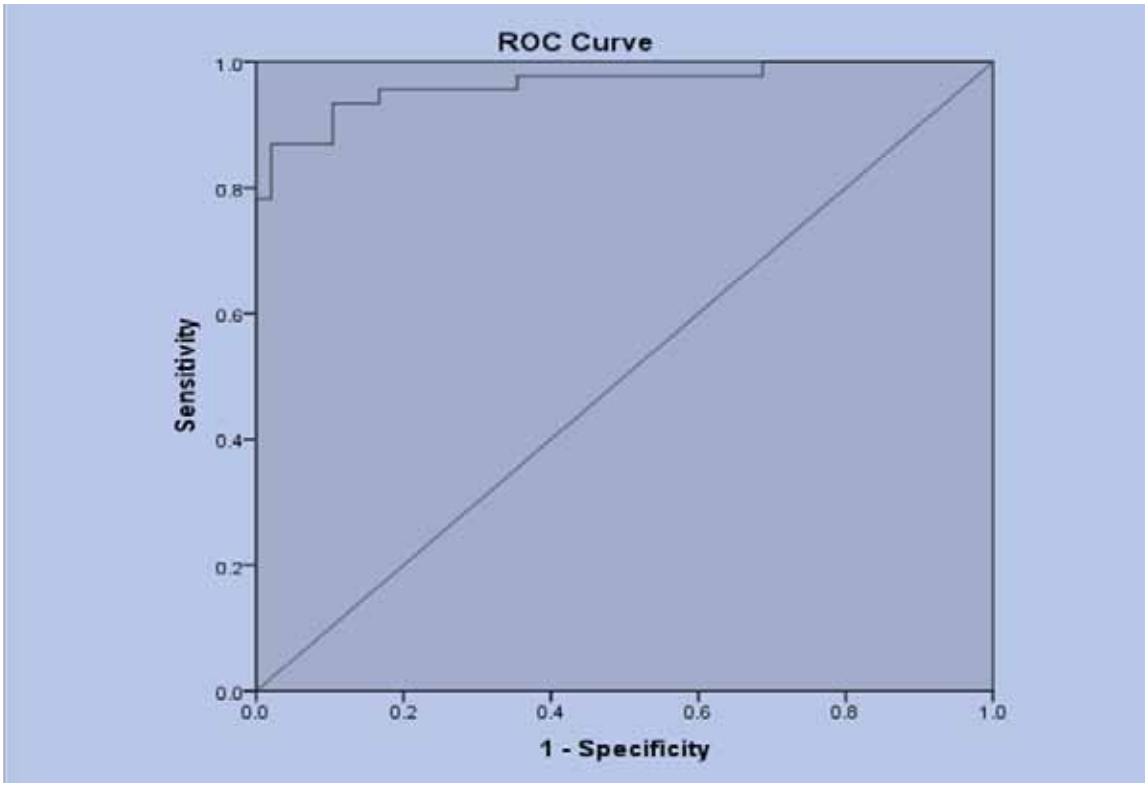

Figure (1): ROC curves for miRNA-378 Ct value in all study groups

miRNA-378 as a screening marker: To evaluate the potential diagnostic value of miRNA-378, the ROC curve has been used. For cut-off value, values exceeding the cut-off are positive, while those below the cut-off are negative.

It is found that the area under the ROC curve (AUC) was 0.965 (Fig. 1). The sensitivity and specificity were 0.978 and 0.646, respectively. The cut-off Ct value was 20.06, it was appeared to have independent associations with the clinical end-points that are studied. As a blood-based marker, the miR-378 characteristics as highly sensitivemay improve the screening values of DbCM. These results suggested that miR-378 may be highly sensitive and moderately specific enough to detect DbCM.

The extremely high sensitivity (0.978) of miR-378 to identify DbCM patients from non-symptomatic diabetic individuals exceeded our most optimistic expectations.

These findings strengthen the clinical applicability of circulating miR-378 as a biomarker of diabetic cardiomyopathy in type 2 diabetes patients.

Conclusion

Serum miR-378 expression level can be regarded as a non-invasive tool to improve the detection, prediction, and monitoring of cardiac-related complications in the early stages of diabetes.

Ethical Issues:

a. Approval of scientific committee of the Clinical Biochemistry Department in Babylon Medical College/University of Babylon/Iraq.

b. Approval of Babylon Health Directorate/Ministry of Health & Information Center for Research & Development of Babylon Province.

c. The objectives and methodology were explained to all participants in the current study and their vocal consent was gained.

Using the Digital Occlusal Analysis (T-Scan NOVUS) in Diagnosis the MFDS in Iraqi Patients During Lateral Excursion Movements

Sanaa Abdul Hameed Hussein[1], Jamal N. Ahmed[2]

[1]Researcher B.D.S M.Sc., [2]B.D.S., M.S., Ph.D. Prof., College of Dentistry, University of Baghdad, Iraq

Abstract

The aim of the study is to evaluate the effectiveness of digital occlusal analysis (T- scan) in diagnosis the patients with MFDS during lateral excursion movements. Method and materials: participants with full dentition and angle class I relation. Patients diagnosed based on DC/TMD criteria, digital occlusal analysis including (disclusion time, occlusion time) registered by T-Scan NOVUS device during the excursion movements in both (Right and Left) sides. Results: Non-significant differences between the age groups, a significant differences between the gender groups and the females were more prevalent than the males, all the means values of occlusal parameters (disclusion time, occlusion time) were higher in MPDS patients group than healthy control group, Highly significant difference according (disclusion time, occlusion time) are documented between MPDS patients and the healthy control in lateral excursion movements (R & L). Conclusion: This study concluded, that the digital occlusal analysis measured by T scan Novus devise is a more accurate and objective method in diagnosis the patients with MPDS during lateral excursion movements.

Keywords: *Occlusion time, disclusion time, occlusal force, MFDS, T-scan, OT, DT, lateral excursion.*

Introduction

Myofascial pain is one of the most common types of chronic muloskeletal pain in clinical medicine[1,2]. A hyperirritable spot in a palpable taut band of skeletal muscle fibers, and having MTrPs is necessary to confirm the diagnosis of myofascial pain[3]. Several possible mechanisms can lead to the development of myofascial trigger points, including low-level muscle contractions, contractures, direct trauma, muscle overload, postural stress[4,5,6]. Dynamic stability in relation to the TMJ is the characteristic of the joint to achieve normal function[7].

T-Scan is a digital occlusion analysis system that records and measures tooth contact, force, and timing in real-time (8, 9 and 10). The Disclusion Time is defined as the duration of time that working and non-working molars and premolars are in contact during a mandibular excursive movement[11]. The more time taken for excursive movement (>0.4sec) leads to longer compression of the periodontal ligament, thereby leading to muscle hyperactivity[12]. The time reported from the first occlusal contact until reaching the maximum intercuspation is known as Occlusion Time (OT)[13]. According to the manufacturer, OT is recommended as less than 0.2 seconds[14, 15]. OT has been considered as a capable description of occlusion[16].

Method and Materials

This study was designed and conducted in the department of oral medicine in the teaching hospital of College of Dentistry/University of Baghdad in period from April 2019 to February 2020. The participants were selected according to the Diagnostic Criteria for Temporomandibular Disorders[17] after obtaining ethical approval from the institutional ethical committee and written informed consent. The participants completed

a self-reported questionnaire, containing information about personal, medical, and dental histories.

Digital occlusal analysis including Disclusion time (DT) and Occlusion time (OT) registered using the T-Scan NOVUS system (T-Scan, Tekscan, Inc., S. Boston, MA, USA) system, shown in figure (1). Subjects with full dentition, Angle class I relation and no history of any systemic diseases related to both groups (patients and controls) which included in this study, while any patient has ongoing treatments or recently treated from TMJ disorders excluded from this study.

Analysis of data was carried out using the available statistical package of SPSS-25. The significance of difference of different means (quantitative data) were tested using Paired-t-test for difference of paired observations (or two dependent means. The significance of difference of different percentages (qualitative data) were tested using Pearson Chi-square test (c^2-test) with application of Yate's correction or Fisher Exact test whenever applicable. Statistical significance was considered whenever the P value was equal or less than 0.05.

Figure 1: T-Scan (Novus) device

Results

One hundred and ten (110) participant were included in this study with age range (18-43) years old and divided into two main groups: diseased group (show signs and symptoms of myofacial pain syndrom) with (85) patients and (25) healthy controlled free from signs and symptoms of MPDS. The male: female ratio of the DG was (17:68) and within the control group was (10:15). Table (1) showed the demographic characteristic of the study groups. There were no significant differences P>0.05 according to the age between the two study groups while according to gender this study reported a significant difference P≤0.05 and the females were more predominant than males.

Table (1) Demographic characteristic of the study groups.

		Diseased group		Control group		P value
		No	%	No	%	
Age (Years)	<20y	11	11.9	1	4.0	0.356 NS
	20---29	28	33.3	10	40.0	
	30---39	31	36.9	12	48.0	
	=>40y	15	17.9	2	8.0	
	Mean±SD (Range)	30.5±8.3		30.5±6.3		
Gender	Male	17	20.0	10	40.0	0.012 S
	Female	68	80.0	15	60.0	

*Significant difference between proportions using Pearson Chi-square test at 0.05 level,
NS: Non–Significant, SD: Standard Deviation, No: Number, % Percentage

Table (2) represented the descriptive Statistics of [Disclusion time test] parameter in the studied groups during lateral excursion movement (Right and left). The results showed the mean values in diseased group were higher than control group also a highly significant difference P< 0.01 has been documented between the diseased and control groups.

Table (2) Descriptive Statistics of [Discclusion time test] parameter in the studied groups distributed for different locations

Locations	Groups	No.	Mean	SD	P-vale (*)
Right Lateral	Diseased	85	0.54	0.45	0.020S
	Control	25	0.15	0.14	
Left Lateral	Diseased	85	0.69	0.46	0.056S
	Control	25	0.24	10.69	

NO: Number; S: significant P≤0.05

As shown in table (3) the occlusion time test parameter showed a significant difference P≤0.05 between the diseased group and control group during the excursion movements (R & L) and with average mean values higher in diseased group than control group.

Table (3) Descriptive Statistics of [Occlusion time test] parameter in the studied groups during lateral excursion movements (R & L)

Locations	Groups	No.	Mean	SD	P-vale (*)
Right Lateral	Diseased	85	0.57	0.39	0.053 S
	Control	25	0.10	0.28	
Left Lateral	Diseased	85	0.45	0.34	0.036 S
	Control	25	0.12	0.16	

S: Sig. at P<0.05, SD slandered deviation, NO: number

Discussion

This study illustrated that no differences P>0.05 in age groups while according to the gender a significant difference P≤0.05 was reported among studied groups. Also, the study showed MFDS is more common in females than males, with several studies registered a high prevalence of TMDs in females patients[18,19,20] which agree with current study. Pain intensity in women with TMD during the menstrual cycle was the highest and was associated with high concentrations of estrogen[21], this result was in agreement with other recent study reported by [22] that demonstrated the presence of estrogen receptors in women's TMJs changes metabolic functions, increasing ligament laxity. Other potential reasons include neurophysiologic and psychosocial reasons that result in more severe and more frequent pain in females than in males [23]. The finding of gender difference s associating with TMD pain symptoms supports the previous studies [24, 25]. The previous findings stated that TMD is most common among 20- to 40-year-olds [26, 27, 28], and these with agree the present study that showed a significant differences in TMD pain symptoms between age groups, but this study was in contrast with [29]. In certain cases of TMD or OFP, the etiology is at least partially related to occlusion in the form of excessive forces on individual teeth (high spots) or interferences to function [30]. These conditions can be readily detected by the T-Scan but not by just analyzing marks on the teeth [31]. The T-Scan measures both the relative force on each tooth and timing of the contacts, the practitioner can pinpoint any occlusal problem without guessing [32]. Prolonged excursive frictional contacts increase the total time PDL mechanoreceptors are compressed in excursive movements, where the PDL compression time is equal to the DT duration of that same excursion [33]. The more time the excursive interferences contact, the longer time the PDL are compressed, resulting in prolonged durations of masticatory muscle contractions [34]. The fact that mentioned above displayed in current study which all means of the diseased group were higher than the control group this agree with previous study documented by [35]. Ciavarella *et al.,* [36] illustrated that the prolonged disoclusion time, frequency of premature contacts and asymmetry in the occlusal force, intracapsular joint disorder lead to various temporomandibular joint related problems and this with agree with current study. Significantly longer disclusion time, higher posterior frictional contacts, and more TMD symptoms were observed in the post-orthodontic group, suggesting that orthodontic treatment increases posterior tooth friction. Computerized occlusal analysis is an objective diagnostic tool determining the quality of excursive movements following orthodontic treatment[37].

Specifically, Disclusion Time Reduction (DTR) of all molars and premolars to < 0.5 seconds per lateral excursion has been shown to reduce muscle hyperactivity levels and their related myogenous symptoms pre to post treatment. Different authors using this technique have reported statistically significant differences in Disclusion Time durations, muscle contraction levels, Time-to-Muscle Shutdown durations, and rapid muscular TMD symptom resolutions [38]. This study has considered occlusion time (OT) and has shown that the differences between healthy patients and those suffering from MPS were statistically highly significant and the average values of occlusion time were longer in comparison to the control group, The results of this study are similar to the results of studies carried out by Baldini, Nota and Cozza in Italy [39]: occlusion time longer by 0.18 s was recorded among investigative groups whereas the results were statistically significant,also is agree with Wang and Yin who reported average value of occlusion time was 1.36 ± 0.03 s longer than in the control group, whereas the average in patients with TMDs was as high as 2.05 ± 0.06 [40]. When compared between current study and Agne Dzingute *et al*., [41] previous study was in contrary statically but is agree about the TMD group has the average value 0.045 s longer in comparison to the control group related to OT. The T scan results showed both occlusion time and disclusion time in the patients with TMD disorders are significantly extended than the normal subjects [42].

Conclusion

This study concluded, MPDS is more prevalent in the females than males, Occlusal parameters included (DT and OT) recorded by digital occlusal analysis (T-scan) showed with more average values in MFDS patients than the control group and a high significant difference P≤0.01 recorded between them. So the digital occlusal occlusal analysis measured by T scan Novus devise is a more accurate and objective method in diagnosis the patients with MPDS during lateral excursion movements.

Awareness on Nutritional Anemia and its Prevention among Adolescent Girls

Santhi P.[1], G. Ambujam[2]

[1]Research Scholar, Associate Professor, Vinayaka Mission's College of Nursing, Karaikal, Vinayaka Missions' Research Foundation–DU, Salem, [2]Dean & Professor of Surgery, Research Guide, Vinayaka Mission's Medical College, Karaikal, Vinayaka Missions' Research Foundation–DU, Salem

Abstract

Background: Adolescence is the period of rapid growth with physical & physiological development and profound biological, emotional, social, and cognitive changes in human beings. Nutritional anemia is the common & worldwide public health problem among adolescent girls and overall prevalence of nutritional anemia varies from 40-90%. It may produce adverse effects like increased risk of morbidity and mortality and affects adolescent's future health.

Objective: This study aimed to assess the awareness on nutritional anemia and its prevention among adolescent girls.

Method: A non experimental descriptive design was adopted to assess awareness on nutritional anemia and its prevention among adolescent girls at Keezhakasakudi, Karaikal. A total of 60 adolescent girls between 10-15 years of age were selected by convenience sampling technique. Data was collected by using self structured interview schedule. Both descriptive and inferential statistics were used to analysis the gathered data.

Results: The study results reported that the majority 63% (38) of adolescent girls had inadequate awareness, 27% (16) had moderately adequate awareness and only 10% (6) had adequate awareness on nutritional anemia and its prevention. The overall mean was 9.6 with standard deviation±2.49. The results of the present study also revealed that there was statistically significant association between level of awareness on nutritional anemia with age of the adolescent girls.

Conclusion: Nutritional anemia as the major non communicable disease and contributing negative impact on health, it necessitates the need to organize counseling programs to adolescent girls in schools and colleges with much emphasis on impact of nutritional anemia on future health.

Keywords: Awareness, Nutritional anemia, Prevention, Adolescent girls.

Introduction

Adolescence is the period of lifetime between 10 to 19 years of age as per WHO. It is the period where there is rapid growth with physical & physiological development and profound biological, emotional, social, and cognitive changes in human beings.[1]Adolescent period forms the basis of development of many habits which may persist for lifelong including eating habits. Adolescence needs extra nutrients to meet their increasing demands of rapid growth and development. Majority of adolescents develop nutritional anemia due to lack of necessary nutrients in the diet, imbalanced diet, craving for junk foods and fast foods, having the habit of skipping meals and peer group influence

in deciding eating choices. Nutritional anemia is a universal problem of adolescent girls particularly in low economic under developed and developing countries including India.[2] Nutritional anemia is the common & worldwide public health problem among adolescent girls and overall prevalence of nutritional anemia among adolescent girls in Northwest Ethiopia was 25.5%[3]. Prevalence of anemia among adolescent girls differs in different parts of India and findings of research studies revealed that 35.9% in Karaikal[4] 48.63% in Tamil Nadu,[5] 50% in Bihar,[6] 78.3% in Mumbai,[7] 78.5% in UttarPradesh,[8]78.8% in Odisha,[9] 84.3% in rural south India[10] and 90% in Nagpur.[11]Low socioenomic class, dietary diversity, household food status, living status, literacy level, parasitic infestation, haemolytic disease, malaria, menstrual abnormalities and bioavailability of iron are the contributing factors for anemia among adolescent girls.[12] Nutritional anemia in adolescent girls may lead to decreased oxygen carrying capacity of the blood which in turn caused decreased work capacity, inability concentrate in academic activity and problems in menstruation.[13] It may also produce impact on their future life when the adolescence enters into reproductive age; it may produce adverse effects like increased risk of morbidity and mortality during antenatal, intra natal & postnatal period and also low birth weight babies.[14] Hence it is necessary to know the existing level of awareness among adolescent girls in order to adhere to the preventive steps to reduce its prevalence.

Statement: A study to assess the awareness of nutritional anemia and its prevention among adolescent girls at Keezhakasakudi village, Karaikal

Objectives:

- To assess the awareness on nutritional anemia and its prevention among adolescent girls
- To associate the level of awareness on nutritional anemia and its prevention with demographic variables of adolescent girls.

Materials and Method

A non experimental descriptive design was adopted to assess awareness on nutritional anemia and its prevention among adolescent girls at Keezhakasakudi village, Karaikalfor this study. Convenience sampling technique was used to select 60 adolescent girls of 10-15 years for the study. A pretested self structured interview schedule was used to collect the data from the participants. The tool consisted of two selections. Section A consisted of 12 items on demographic profile of adolescent girls such as age, educational, mother's education & occupation, father's education & occupation, monthly family income, religion, type of family, No. of children, Age at menarche and mode of getting information related to nutritional anemia. Section B included 20 items of multiple choice questions regarding awareness on nutritional anemia and its prevention which included meaning, causes, clinical features and prevention of nutritional anemia. The reliability of the tool was tested by split half method. (r=0.8) Pilot study was carried out for six participants to check the feasibility and practicability of the study. It was found feasible to conduct the study. After explaining the purpose of the study, informed oral consent was obtained from each adolescent girl. Self structured interview schedule was administered to each participant to collect the data. It took 15 – 20 minutes to collect information from each participant. Descriptive statistics such as mean, mean percentage, standard deviation were used to analysis level of awareness. Inferential statistics such as chi-square was used to associate the level of awareness with demographic variables.

Results

- The study results revealed that the majority 35% (21) of the adolescent girls were between the ages of 14-15 years
- The highest 35% (21) of study participants were in 6th standard and the least 16.7% (10) were in 9th standard.
- With regard to the mother's educational status, the majority 25% (15) were illiterate and the less 15% (9) had primary and secondary education.
- Based on the mother's occupation the highest 28.3% (17) were government employees and 20% (12) had self employment.
- With respect to father's educational level, the greater 38.3% (23) had primary education and only 10% (6) had higher secondary education and 31.7% (19) of the study participant's father were employed in private organization.
- The majority 30%(17) had monthly family income above Rs. 15,001/- and the least 20%(12) had monthly family income less than Rs. 5000/-
- The maximum 75% (45) of study participants belonged to Hindu religion and living in a nuclear family.

- The study result also revealed that the highest 56.7% (34) of family had only one child in their family.
- The majority of adolescent girls 35% (21) had menarche at the age of 13-16 years.
- The maximum 28.3 % (17) of adolescent girls reported that the major source of information obtained was through Radio and Television
- The results of the present study revealed that the mean value of awareness on meaning of nutritional anemia was 1.45, on causes of nutritional anemia were 2.15, on clinical features were 2.55 and on prevention were 4.45.
- The study results also reported that the majority 63% (38) of adolescent girls had inadequate awareness, 27% (16) had moderately adequate awareness and only 10% (6) had adequate awareness on nutritional anemia and its prevention. The overall mean was found to be 9.6 with standard deviation±2.49.
- The results of the present study also revealed that there was statistically significant association between the level of awareness on nutritional anemia with only one demographic variable the age of the adolescent girls ($\chi 2$= 10.2) at $p<0.05$ and there was no association between awareness on nutritional anemia with other demographic variables such as educational status, parents educational status and occupation, monthly family income, type of family, number of children in the family, religion and the sources of information.

Discussion

The result of present study revealed that the highest percentage of adoldescnt girls 68%(38) had inadequate awareness on nutritional anemia and its prevention,27%(16) had moderately adequate awareness and only 10%(6) had adequate awareness on nutritional anemia and its prevention. This was supported by the study conducted by Gracy. S & N Junior Sundresh[15] on knowledge regarding prevention and management of anemia among adolescent girls, in Bhadravathi showed that majority of adolescent girls (57%) had inadequate knowledge, only (43%) had moderate level of knowledge and none of the adolescent girls had adequate knowledge. The findings of the present study corresponded with another study conducted by Premaletha T & Safeena S[16] on Prevalence of anaemia and knowledge of adolescent girls regarding anaemia in higher secondary Schools of Thiruvananthapuram corporation which reported that 51% had poor knowledge, 38% had average knowledge and only 11% had good knowledge regarding anemia.

The findings of present study revealed that the overall mean of awareness on nutritional anemia was found to be 9.6 which showed moderate awareness. Still there is widespread prevalence of anemia among adolescent girls and there is a need to change the attitude and behavior of adolescents to combat anemia. The findings of present study was found less than the study results conducted by Chandrasekhar M et al.[17] on assessment of Knowledge of Adolescent Girls Regarding the Prevention of Iron Deficiency Anemia in Selected Rural Areas of Mysore which found the mean knowledge score of adolescent girls was 12.58. Hence it is necessary to organize health education programme with more focus on specific issues and information on anemia such as healthy dietary pattern including intake iron and vitamin C rich foods, reducing junk foods, fast foods and avoiding tea and coffee to enhance iron absorption and proper utilization of deworming and iron supplementation provided by school health programme.

Table 1: Percentage distribution of level of awareness on nutritional anemia and its prevention among adolescent girls

Level of Awareness	Frequency	Percentage
Inadequate	38	63
Moderately adequate	16	27
Adequate	6	10
Total	**60**	**100**

Table 2: Mean, standard deviation & mean percentage of level of awareness on nutritional anemia and its prevention

Items	Maximum attainable score	Mean	SD	Mean Percentage
Meaning	3	1.45	1	13.68
Causes	5	2.15	1.35	20.28
Clinical Features	4	2.55	1	24.06
Prevention	8	4.45	1	41.98

Conclusion

Nutritional anemia as the major non communicable disease is prevailing among adolescent girls and contributing negative impact on physical health as well as their academic performance and cognitive ability. It is necessary to create awareness on nutritional anemia and its prevention with multiple audio visual aids to enhance desired behavior change among adolescent girls. This also necessitates the need to organize counselling programs to adolescent girls in schools and colleges with much emphasis on impact of nutritional anemia on future health.

Incidence and Predictors of Postoperative Acute Kidney Injury in Non-Cardiac Surgery

Sara Mary Thomas[1], Bhavika Sangada[2], Sanam Vasava[3], Lokesh Akkineni[4], Chaitri Shah[5]

[1]Associate Professor, [2]Associate Professor, [3]Assistant Professor, Department of Anaesthesiology, Smt. B.K. Shah Medical Institute & Research Centre, Sumandeep Vidyapeeth Deemed to be University, Vadodara, Gujarat, India, [4]Medical Director (MD Anaesthesia) Akhila Health Services, Charla, Karimnagar, Telangana, [5]Professor, Department of Anaesthesia, SMS MC Hospital, Ahmedabad, Gujarat, India

Abstract

Background and Aims: Incidence of Postoperative (Postop) Acute Kidney Injury (AKI) and related comorbidities can be prevented by identifying various preoperative and intraoperative predictors in the patients. Early recognition of risk factors and timely intervention can reduce morbidity and mortality related to AKI in a patient with preoperative normal renal function .

Method: This prospective observational cohort study was done in 100 patients undergoing major noncardiac surgery under spinal, epidural or general anaesthesia, who were having normal preoperative renal function. Intraoperative predictors of AKI monitored were bloodloss, hypotension, duration of surgery, volume of fuid infused, urine output (UOP), use of vasopressor and diuretics. Postoperatively urine output and serum creatinine level were noted for 3 days. Postoperative AKI was defined and classified as per RIFLE criteria.

Results: Total 33% patients were diagnosed to have Postop AKI and the major risk factors identified were duration of surgery, volume of fluid given intraoperatively, blood loss and UOP postoperatively (p value <0.001). Non significant risk factors were demographic data, mode of anaesthesia given, diuretic usage, drug therapy.

Conclusion: We concluded in our study that in patient with preoperative normal renal function undergoing noncardiac surgery various predictors for AKI can be identified early and optimised for better outcome. These factors are duration of surgery, blood loss, volume of fluid infused.

Keywords: *Acute kidney injury, Diuretics, non cardiac surgery, RIFLE criteria, S.creatinine.*

Introduction

Acute kidney injury (AKI) is defined as "A syndrome that manifest within 48 hours and characterized by rapid decline in Glomerular filtration rate (GFR), retention of Blood urea nitrogen (BUN) and creatinine."[1] The etiology of Acute Renal Failure (ARF) is multifactorial and most common is ischemia leading to acute tubular necrosis.[2] Others are various toxin injury and rhabdomyolysis. The development of ARF postoperatively in non cardiac surgeries can increase morbidity, mortality and postoperative (postop) hospital stay and cost.[3] There are only few studies available that hypothesised incidence of postop AKI in non cardiac and non vascular surgeries having normal preoperative renal function,hence we initiated this study to identify preoperative, intraoperative and postoperative predictors that can be useful to prevent outcome related to AKI.

Aims and Objectives: The aim of this study is to predict and identify the risk factors for Postop AKI in

non cardiac surgical patients with baseline normal renal function.

Material and Method

After approval from the institutional ethical committee and written informed consent, hundred patients of either sex had been enrolled in this prospective, observational, cohort study. Patients undergoing major non cardiac surgeries under spinal, epidural or general anaesthesia having preoperative normal renal function were included in this study. Patients who were undergoing cardiac or vascular surgery, having altered renal function, sepsis and who were given radioactive contrast 48 hours before surgery were excluded from the study. Preoperative complete heamogram, blood sugar, urine examination, Serum (S.) creatinine, S.urea, S.electrolytes, Electrocardiogram (ECG), Chest Xray and other relevantinvestigations

were done. GFR was calculated using Cockcroft - Gault formula. Intraoperative predictors monitored were type of anaesthesia, duration of surgery (more than 2 hours),blood loss, occurrence of intraoperative hypotension (Systolic Blood Pressure [SBP]<90 mm of Hg), volume of intravenous fluid, vasopressor used and Urine output (UOP). Postoperatively UOP, S.creatinine and urea were noted for 3 days. AKI was defined and classified as per RIFLE criteria[4](increase in S.creatinine >0.3 mg/dl above baseline or >1.5 times within 48 hours, decrease in UOP <0.5 ml/kg/hour for at least 6 hours postoperatively.)

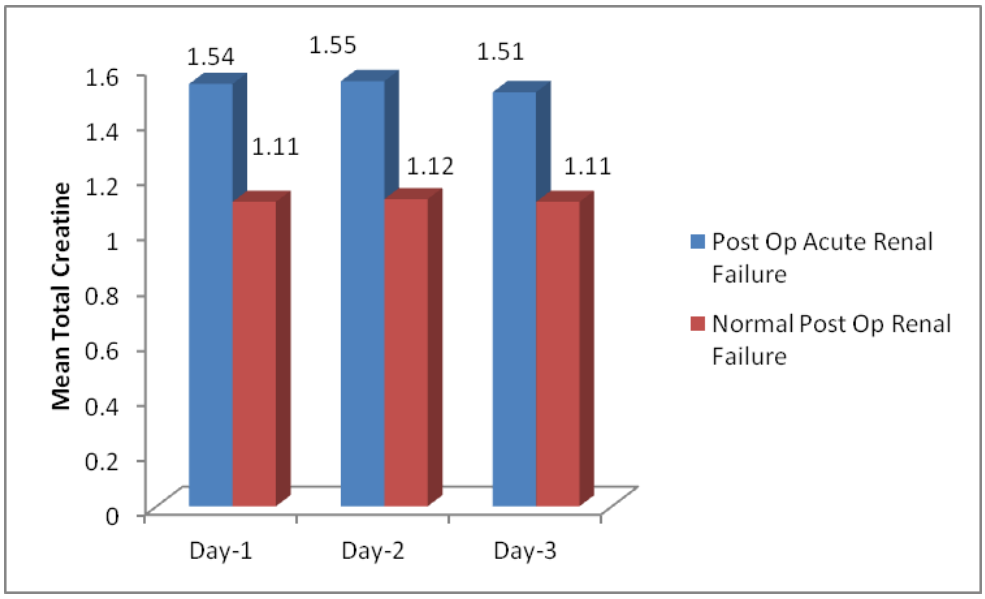
Statistical Analysis: The result of continuous variables were given as mean ± SD. The difference between the two group was assessed by unpaired 't' test. P value <0.05 was considered significant.

Observation and Results

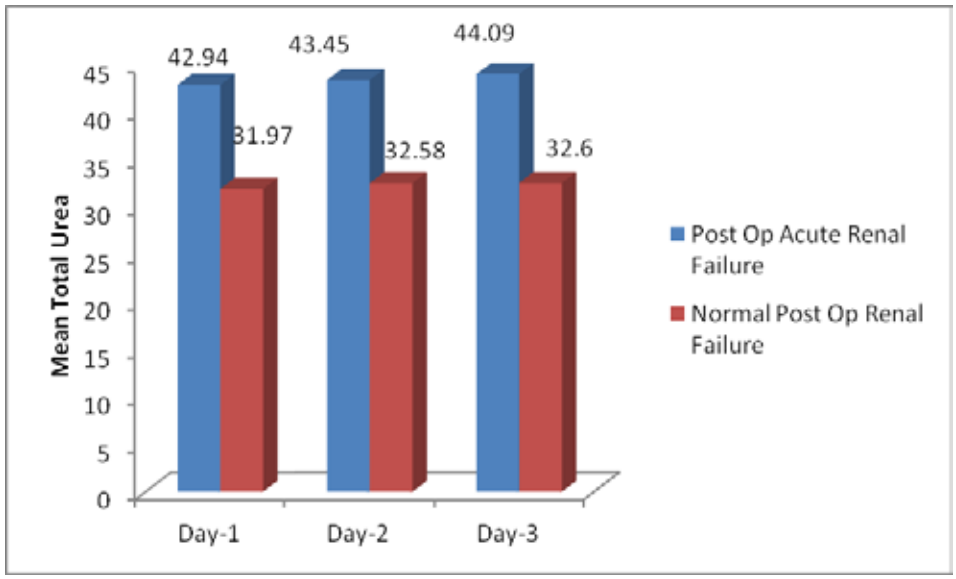
A total of 100 cases were reviewed and 33% of patients were diagnosed to have Post op AKI according to RIFLE criteria.

The preoperative mean serum creatinine and serum urea levels were comparable in both groups . Among the 67 patients who had normal post-operative renal function had mean pre-operative serum creatinine value of 1.18±0.19, while among the 33 patients who developed post op ARF had pre op mean serum creatinine value of 1.18±0.165, p value of 0.914 which was statically non-significant. Similarly mean pre-operative blood urea value in both groups were 37.91±4.4779 and 38.42±5.512 respectively and p value was 0.632 which was also statistically non-significant.

There were significant increase in Serum Creatinine and Serum Urea levels in Day 1,2,3 in 33% of patients who developed Post op AKI as depicted in Graph 1 and 2.



Graph 1: Mean of Total Creatinine 72Hrs.



Graph 2: Mean of Total Urea 72Hrs

There was significant decrease in urine output in Postop Day 1,2,3 in patients who developed Postop AKI as compared to those who had normal Postop renal function as shown in Table 1.

Table 1: Mean of Total Urine Output 72Hrs

Postop Day	Urine Output (ml)		p-value
	Postop Acute Renal failure (n=33)	Normal Postop Renal Function (n=67)	
1	730.94±344.546	1297.01±432.484	<0.001
2	690.61±299.426	1264.15±379.57	<0.001
3	730.3±377.521	1241.73±369.891	<0.001

On evaluating the predictors for Post op Acute Kidney Injury, it was found that, both groups were comparable with respect to their demographic profile .Both groups did not differ significantly with respect to type of anaesthesia provided – spinal anaesthesia, general anaesthesia and epidural anaesthesia (p value – 0.78, 0.58 and 0.44 respectively). Diabetes Mellitus and Hypertension were not found to be significant risk factors for Postop AKI (p value-0.357, 0.022 respectively.)

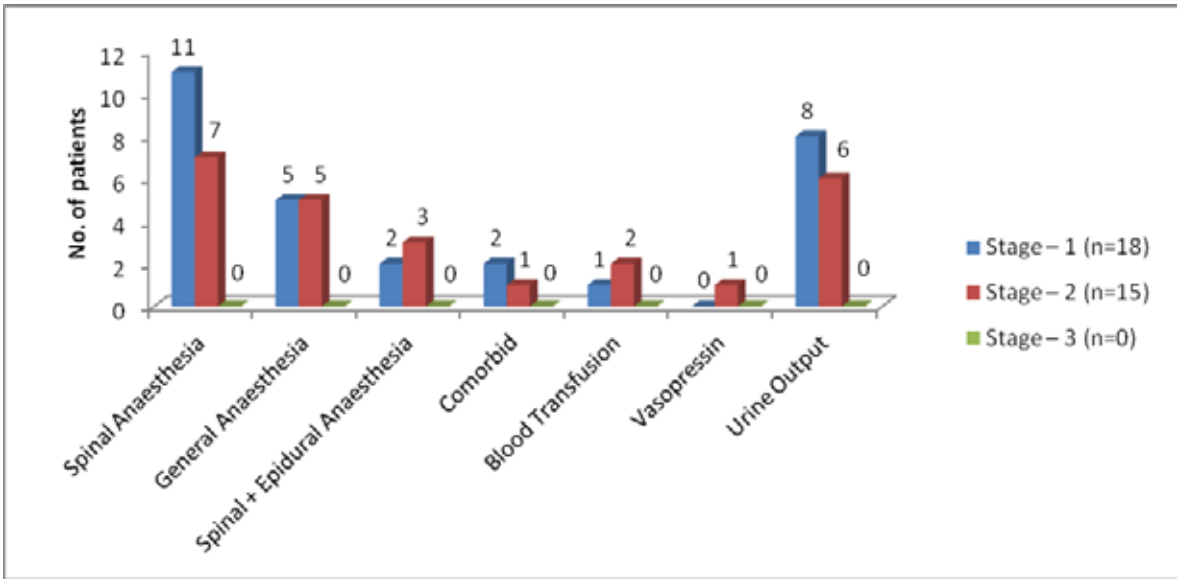
The significant intraoperative parameters were duration of surgery, volume of fluid used and blood loss. It was found that longer duration of surgery, increased blood loss and increased volume of intravenous fluid played a significant role in the development of Postop AKI as shown in Table 2.

Table 2 : Mean of Intra Operative Data

	Post op Acute Renal failure (n=33)	Normal post op Renal Function (n=67)	p-value
Duration of Sx (hours)	2.9139±0.69652	1.9422±0.6987	<0.001
Vol. of Fluid in Sx (ml)	2374.55±617.789	1718.81±482.545	<0.001
Blood loss (ml)	398.79±84.512	190±119.598	<0.001

Sx– Surgery, Vol- Volume.

The patients in our study were staged according to RIFLE criteria and also along with the parameters as depicted in Graph 3. In our study, most of the Acute Kidney Injury patients belonged to Stage 1 and 2 and there were none in Stage 3.



Graph 3: RIFLE Criteria staging according to parameters.

Discussion

In our study of 100 patients, who were operated for non cardiac surgeries, the incidence of Postop Acute Kidney Injury according to RIFLE criteria was 33%. Based on RIFLE criteria staging of Acute Kidney Injury, most of the patients belonged to Stage 1 and 2 and none were in Stage 3. The rate of perioperative AKI is difficult to know precisely as it is dependent on definitions used and type of surgery studied .In the cardiac surgery population, ARF defined as 25% increase in creatinine, occurs in 17% of these high risk surgical patients according to Fengwang MD et al. [5] After aortic aneurysm repair, incidence of renal failure have been reported as 15%to 46%. [6]

Kheterpal et al[3] studied a total of 65,043 cases, with pre-operative normal renal function operated for noncardiac surgeries and noted an incidence of renal failure defined by GFR less than 50 mL/min as 0.8%.

In our study, co morbid diseases like Diabetes Mellitus and Hypertension were not significantly related to the development of Postop AKI whereas the study which was done in cardiac patients with co morbid conditions mentioned above by Robert C. Albright et al[7] found significant changes in the renal function which were more so in Hypertensive patients than in patients with Diabetes Mellitus.

We had included in our study, patients undergoing major non cardiac surgeries under Spinal, Epidural or General Anesthesia and we concluded that there were no significant changes in the renal functions postop because of the mode of anesthesia given for surgery. This was in concordance with the results found by Marijana et al[8] in hisstudy.

The significant intra operative predictors which we had found in our study were duration of surgery, volume of fluid given and the total blood loss. The patients who developed postop AKI had longer duration of surgery with greater blood loss and increased volume of intravenous fluid administered to compensate hypotension as compared to those who had normal postop renal function. Kheterpal et al[3] studied patients with preoperative normal renal function posted for noncardiac surgery and developed a preoperative renal-risk index that identified the following independent risk factors for postop renal failure : age, emergent surgery, liver disease, body mass index, high-risk surgery, peripheral vascular occlusive disease and chronic obstructive pulmonary disease (requiring chronic broncho dilator therapy).[3] The

intraoperative risk factors which he identified were : use of a vasopressor infusion, mean number of vasopressor bolus doses administered, administration of furosemide or mannitol, units of packed red blood cells required and hypotension defined as Mean Arterial Pressure less than 50mmHg.

Namrata Khanal et al(2007)[9] studied the factors predicting renal outcome in patients developing acute renal failure in pregnancy. She concluded that Ante-Partum Haemorrhage and prolonged oliguria were strong predictors of irreversible renal failure. This inference highlighted the need for early recognition of the predictors and the importance of trained birth attendants and antenatalcare.

Sean A josephs et al (2009)[10] from his observations reflected that there is no single therapy that will prevent perioperative AKI. Clinical risk factors are similar but not identical in different surgical populations. He concluded that there were more likelihood of reducing perioperative AKI through better optimization and management of the many comorbidities and hemodynamic derangements that have been shown to impact renal function.

Conclusion

In our study we observed that the incidence of Postop Acute Kidney Injury in non Cardiac Surgery was 33% according to RIFLE criteria. The highly predictive factors were duration of surgery, blood loss and volume of fluid infused.

We can conclude that the incidence of postop AKI can be decreased by early recognition and by optimising the comorbidities and predisposing factors.

Gender Differences in Life Satisfaction: The Moderation Role of Social Support among Older Persons

Sarah Al-ja'freh[1], Rabia Allari[2], Ayman M. Hamdan-Mansour[3]

[1]Lecturer; Department of Medical Sciences, Al- Balqa Applied University. Salt, 19117 Jordan, [2]Assistant Professor, Faculty of Nursing, Al Ahliyya Amman University. Salt. Jordan, [3]Professor, Mental Health Nursing, School of Nursing, the University of Jordan

Abstract

Introduction: Life satisfaction among older persons is one significant component of quality of life. However, differences related to gender and moderation role of social support might affect life satisfaction. **The purpose** of this study was to examine the moderation effect of perceived social support on the relationship between gender and life satisfaction among older persons.

Method: A predictive-exploratory approach was used. Data collected from 966 persons at age of 60 years or older using a structured interview format.

Results: In general, older persons had moderate to a high level of life satisfaction and perceived social support. Perceived social support had a significant moderation effect on the relationship between gender and life satisfaction ($F_{7,913}$= 52.37, p<.001; R^2= .152).

Conclusion: Life satisfaction among older persons is influenced by social support indicating importance of creating and enhancing the supportive system available to older persons.

Keywords: *Life Satisfaction; Older Persons; Social Support; Gender.*

Introduction

Worldwide, number of older persons, aged 60 years or above, by the year 2030 will reach 1.4[1]. By 2050, 80% of older people will be living in low- and middle-income countries[2]. The elderly population in Jordan (over age of 60) in the year 2015 reached 0.4 million, including 49.1% females and 50.9% males[3]. The number will increase to reach 8.6% by year 2030[4]. Such a situation might impact the quality of life among older persons and their psychological wellbeing causing further health problems[5-7]. The literature indicated that older persons suffer from a myriad of physical and psychosocial morbidities which may decline their quality of life (QoL) and affecting their life satisfaction[8-10]. Older women and men found to be different in their health needs, that consequently, influencing their perception of life satisfaction and quality of life (QoL)[11-12].

Life satisfaction is one of the three major indicators of subjective well-being (SWB) that reflects the overall assessment of feelings and attitudes about one's quality of life [13]. While some researchers reported that differences among older males and females in life satisfaction existed, others found no significant differences [11]. Furthermore, studies suggested a stronger association of life satisfaction and incidence of chronic diseases in older women than in older men[14-15]. Being a female is connected to lower perception of life satisfaction which explains higher morbidity rates among older women [16]. Evidences showed that social support associate with lower health cost and higher perception of wellbeing among older persons[17]. It has also been found that

older persons with high level of social support are more capable to maintain their health and daily activities[18]. Although literature explored adequately older person's health and well-being[19-22], the inter connectedness of age, gender, and life satisfaction addressing the role of social support as a moderating factor has little attention. Therefore, the purpose of study was to examine the moderation effect of perceived social support from family, friends, and others on the relationship gender and life satisfaction in a sample of older persons with chronic illnesses in Jordan the specific aims were:

- To examine the moderating effect of perceived social support on the relationship between gender and life satisfaction among older person diagnosed with chronic illness?
- To test the differences in life satisfaction in relation to gender among older person diagnosed with chronic illness?

Materials and Method

Design: A cross sectional, predictive explorative design was used. Data collected using structured interview format.

Sample and Setting: A total of 996 older persons agreed and completed the questionnaire of a total of 1200 approached forming 83% response rate. Multistage sampling technique was used. Inclusion criteria included: all those above the age of 60 years and able to read and write in Arabic. Exclusion criteria included persons who are physically and mentally incompetent to answer the survey questions according to their next of kind statements.

Data collection Procedures: Data collection started after ensuring ethical approval from the University of Jordan. Privacy and confidentiality maintained and guaranteed for the participants. Structured format of data collection was used in the respondents' households by research team. The family members acted as co-signer of the consent form. The questionnaires were presented in Arabic language.

Instrumentation: The data collected using the Arabic version of scales. The instruments were:

1. The Arabic version of the Satisfaction with Life Scale[23] was used to measure Life satisfaction[24]. The scale is a five items scale measuring general life satisfaction. Respondents are asked to make their responses on a seven-point scale ranging from strongly disagree (1) to strongly agree (7). The higher the score the higher the life satisfaction is. The scores of the total scale range from 5 to 35 and interpreted as follow: 31- 35 (extremely satisfied), from 26-30 (satisfied), from 21-25 (slightly satisfied), 20 (neutral), from 15-19 (slightly dissatisfied), from 10-14 (dissatisfied), and 5 – 9 (extremely dissatisfied). The scale has good reliability with Cronbach's alpha of .79[23].
2. The Arabic version of the Multidimensional Scale of Perceived Social Support [25] was used to measure Perceived social support [26]. The scale is a 12-item tool measuring perceived social support from family, friends and others the respondents are expected to make their responses on a 7-point Likert scale ranging from very strongly disagree (1) to very strongly agree (7). The higher the score is the higher the perceived social support. This scale had good internal consistency with Cronbach's alpha of .83[25].

Sociodemographic factors included information related to age,gender, marital status, education level, type of chronic diseases if they have, duration of diagnosis of the disease, and smoking status.

Results and Discussion

Descriptive Characteristics: The analysis showed that age ranged from 60 to 100 years with a mean of 68.0 (SD = 7.3). of them, 54.0% (n = 538) were males and 46.0% (n = 456) were females. The majority of the older persons (68.6%, n = 683) were married, and 107% (n = 107) had fulltime work. of them, 28.1% (n=280) have comorbid diagnoses of medical diagnosis, compared to 26% (260) are not diagnosed with any medical (or do not know). For more details see table 1.

Table 1: Descriptive characteristics of the older persons (N=996)

Variable		n	%
Gender	Male	538	54.0
	Female	456	46.0
Education level	≤ High School	770	77.3
	≥ High School	226	22.7

Variable		n	%
Marital status	Single	21	2.1
	Married	683	68.6
	Divorce	34	3.4
	Widow	257	25.8
Working status	Don't work	549	55.1
	Full time	107	10.7
	Part time	56	5.6
	Retired	278	27.9
Smoking status	Yes	264	26.5
	No	732	73.5

Life satisfaction: The mean score of life satisfaction (LS) was 24.1 (SD = 5.9) ranging from 5 to 35 with 50% (n = 498) have a score of 26 or higher indicating a satisfied level. According to level of satisfaction, the analysis showed that 7.8% (n = 78) are extremely satisfied compared to 1.9% (n = 19) extremely dissatisfied.

Perceived Social support (PSS): The mean total score of PSS was 62.1 (SD = 12.9) ranging from 12 to 84. The lowest mean scores for the domains was for PSS-friends (M = 17.6, SD = 5.8), while for PSS family and others were almost equal (M = 22.2, SD = 5.1; M = 22.1, SD = 4.9, respectively).

Model testing: Moderation effect of perceived social support on the relationship between gender and life satisfaction

Path analysis,two-model multiple hierarchical regression analysis, was usedto examine the hypothesis. In block-1, gender was entered and in block-2 perceived social support has been entered. Initially, gender have been regressed using standardized linear regression model on life satisfaction. The analysis showed that the model was not statistically significant (F = 1.91, p = .310). The model was able to explain only 0.5% (R^2= .005) of variation in life satisfaction in relation to gender among older persons. Analysis has shown that gender was not a significant predictor.

Table 3: Regression examining moderation effect of perceived social support on the relationship between gender and life satisfaction (N =996)

Variables	Block 1		Block 2	
	β	*p*-value	β	*p*-value
Gender	-.523-	.226	-.549-	.170
PSS-FA			.163	p <.001
PSS-FR			.120	p <.001
PSS-OTHER			.256	p <.001
R^2	.005		.151	
R^2_{adj}	.001		.146	
R2 change	.146		*p*< .001	
e	.97		.70	

PSSFA: perceived social support from family; PSSFR: perceived social support from friends; PSSOTHER: perceived social support from others.

In block-2, in which perceived social support from family, friends and others added to test its moderation effect, the analysis showed that the model was statistically significant (F = 52.37, p<.001) with R^2= 0.152 and adjusted R^2= .145. The R^2 value of .152 indicates that almost 15% of the variation in the relationship between gender and life satisfaction is related to the moderation effect of perceived social support. The variation has been improved largely with inclusion of perceived social support from model 1 to model 2 where the magnitude of R^2 changes value is .146 indicating the perceived social support has great moderation effect on the relationship between gender and life satisfaction among older person (see table 3). In general, the results infer that adding perceived social support from family, friends and others has buffered the negative influence of gender on the life satisfaction.

Differences in life satisfaction related to selected demographics: The analysis showed no significant differences related to gender (t = .08, p = 941). However, using the univariate analysis to examine the differences between males and females in their life satisfaction controlling for type of medical diagnosis, the analysis showed a significant difference ($F_{1,996}$ = 8738.7, p < .001). Males had higher mean score (M = 24.5, SD = 5.7) than females (M = 23.9, SD = 7.1).significant differences found between males and females controlling for duration of medical diagnosis with mean score for males ((M = 24.5, SD = 5.6) higher than females (M = 23.8, SD = 7.0).

Discussion

Older persons are struggling to manage their biopsychosocial needs within limited available resources in the developing countries[5]. The literature Asserted that older persons are suffering from number of psychological and physical deteriorations[27-30]. This study is extending the body of knowledge identifying the role of social support as moderating factor on the relationship between life satisfaction and gender. The findings of the study provide a new perspective of understanding that the relationship between ageing and the biopsychosocial wellbeing of older persons. We have found that social support is one core component of older persons' quality of lifedue to the effect of social support on the life satisfaction regardless of gender of the older persons. males and females are not simply similar in their social functions.Women are assuming different roles in the Arabian culture in which most of women's responsibilities are geared towards home-related and family-related mattersindicating that women need more social support than men. However, we found that older men and women regardless of their age need an equal social support to successfully maintain their life satisfaction. The results are not in line with other studies [31]who found that perceived social support was more closely related to life satisfaction for women than for men. One explanation is that older women preserve their social roles through maintaining their strong connectedness with their adult male and female children. In Arabian culture, adult male and female children are obliged to seek more constant appraisals from their mothers than fathers in all their life matters. This would explain the higher level of social support that older women received than men. This also explains what we have also found that age and gender of older persons are not significantly related to the level of life satisfaction supporting previous report [30-31] who found no significant differences in life satisfaction in relation to sociodemographic factors.

However, when controlling for health characteristics (type and duration of medical diagnosis)we found significant differences in life satisfaction in relation to gender in which older males were more satisfied with their lives than older females. Such findings would sustain the notion that life satisfaction is complicated within social context. This would suggest that life satisfaction among older persons cannot be measured using global life satisfaction scale. There is a need to develop a measure that emphasizing the social and psychological context of gender role among older persons.

One limitation of this study is that the sample the study is cross sectional in which a longitudinal approach measuring life satisfaction at various points of life would be more informative.

Conclusion

Given the results of the present study, specifically understanding the relationship between ageing, gender, and biopsychosocial wellbeing, the results indicated that adding perceived social support from family, friends and others has buffered the negative influence of gender on the perception of life satisfaction. Older male persons had higher life satisfaction than females controlling for health-related factors. The study implies that social support is one particular factor to consider while attempting to explain or intervene to improve quality of life among older person.

Assistant Professor, MSN, PhD, [5]College of Nursing Science, Kyung Hee University. Associate Professor, MPH, PhD

Abstract

Introduction: The purpose of this study was to provide basic data to develop effective multicultural education programs related to emotional intelligence by understanding its relationship with multicultural cognition, and the attitude of college students in the nursing science departments.

Method: A descriptive correlational survey design was administered on a total of 197 nursing students in Korea. The collected data were analyzed using descriptive statistics, t-test, ANOVA, and multiple regression analysis, with the SPSS/WIN 21.0 program.

Result: The multicultural perception was 3.61 ± 0.40 out of 5, and the multicultural attitude was 4.52 ± .61 out of 6. Emotional intelligence which comprises multicultural cognition ($p< .001$), and multicultural attitude ($p<.001$), all had a positive correlation with multicultural attitude ($p<.001$).

Discussion: To develop multicultural education programs for nursing students and college students, it is necessary to develop and apply differentiated intervention strategies using emotional intelligence.

Implications for nursing: This can contribute to promote flexibility of nursing students and help them adapt themselves to clinical practice.

Keywords: *Emotional Intelligence, Multicultural cognition, Multicultural attitude, Nursing students.*

Introduction

Necessity of the research: Historically, Korea's society shows unity in its characteristics, but this slowly changed as modern society brought about advancement in transportation and communication, along with the exchange of people and goods, which changed the society into a more multicultural one[1]. The result of a survey conducted by the Ministry of Social and Public Administration with a number of foreign residents in Korea shows that long-term foreign residents comprise 3% of the whole population in Korea[2].

In order to create a harmonious coexistence between the local society and newcomers, an alteration in the health service providers should be one important matter that should be discussed[3]. However, since the preference of professionals affect the health services provided and causes inequality, it is important that nurses and doctors avoid an exclusive stance and accept the differences within the society[4,5]. Furthermore, healthcare is expanding more multiculturally and is an important

point in healthcare education. This means that education regarding multiculturalism should be emphasized.

Despite these efforts, there are still existing discriminations and prejudices in the current Korean society, and these views influence the interaction of patients and nurses themselves[6,7]. Therefore, emotional intelligence is an important term that should be viewed in terms of multiculturalism education. Thus people with this characteristic show strength in dealing with biases and controlling their emotions.

Emotional intelligence is the ability to control one's own emotions and understand that of others in different situations[8]. This manifests the optimistic view of the psychological state one is currently in. In the different situations one may be exposed to in the clinical field, this ability is important since one must control one's own feelings and provide healthcare services to the patients. Therefore, this is an important ability that healthcare providers must learn through education[9].

In some studies, the main factors that affect the Korean university students' perspective of multiculturalism and biases are categorized into personal, tendency, experience, and capability factors. Furthermore, out of these factors, the cultural capability factor is a part of emotional intelligence, and this factor interacts with the following knowledge and the acknowledgement[10].

Studies show that emotional intelligence is deeply related to self-efficiency, and it plays an intermediary role for problem behaviors. In the same perspective, the relationship between emotional intelligence and personal factors that influence stress and anxiety in healthcare providers in the clinical field is also a growing issue in nursing science[11,12].

Previous research implies that emotional intelligence is related to one's ability to smoothly solve problems and deal with stressful situations[13,14]. Therefore, without any exposure to multiculturalism in the education process, emotional intelligence is thought to have a positive influence on healthcare providers in the clinical field. However, further research on this subject is still insufficient.

Finding and identifying the exact relationship between emotional intelligence and the cognition of multiculturalism is critical in nursing education. In the rapidly changing multicultural medical arena, nursing should be done under the firm implication of a thorough understanding of multiculturalism in all health service providers. It is important that nursing education ensures this is met. Thus, this current study was conducted to determine the actual relationship between emotional intelligence and the development of multiculturalism-related educational programs.

Research Objective:

1. To understand the emotional intelligence and the acknowledgement of multiculturalism of nursing students.
2. To realize the difference in emotional intelligence, acknowledgement, and attitude of multiculturalism based on general characteristics of nursing students.
3. To understand the relationship between emotional intelligence and the acknowledgement of multiculturalism.
4. To understand the effects of emotional intelligence on the acknowledgement of multiculturalism

Research Method

1. **Research Design:** This study was a descriptive research study with the objective of understanding the effects of emotional intelligence on the acknowledgement of multiculturalism. This study also analyzed the emotional intelligence and the acknowledgement of multiculturalism in nursing students.
2. **Research Subject:** The participants were nursing students from S city to J city. The sample size included 200 people, calculated using the G-power 3.1.1 program. The effect size needed in multi-regression analysis was 0.25, with power (1-β) = 0.80, and significant level (α)=.5. The results showed that 180 participants were appropriate, and an elimination rate of 10% was considered, resulting in a sample of 200 participants. However, in the final analysis, 3 participants were excluded due to missing information and inadequate responses to the survey.
3. **Research Tools:**

1. **Emotional Intelligence:** Emotional intelligence is a term used to describe the ability to understand one's feelings and those of others, and the acknowledgment of these feelings before getting into action[8]. This study used a scale that was adapted from WLEIS (Wong & Law's Emotional

Intelligence Scale[15]) by Jung[16]. Permission was granted for its use. This scale consists of 4 questions on self- emotional understanding, 4 questions on emotional understanding of others, 4 questions on emotional control, and 4 questions on emotional application. The Likert Scale is used to rates responses, where 1= highly unlikely and 7= highly likely. Higher scores indicate higher emotional intelligence. Validity verification was also done, which showed reliability with Cronbach's α= 0.87 (when the tool was created), and α= 0.89 (when the research was conducted)

2. **Acknowledgement of Multiculturalism:** Acknowledgement of multiculturalism is the level measuring how much nurses accept and respect the cultural differences in a society[17]. The tool designed by Kim[18] for teenagers was used, and permission for the use of such was granted. Eight questions regarding acceptance of differences, 6 on sensitivity towards differences, and 6 on openness towards differences were asked, totaling to 20 questions. The Likert Scale was used to rate responses, where 1 = highly unlikely and 5= highly likely, with higher scores indicating a higher level of acknowledgement. The scales's validity was measured, with reliability showing Cronbach's α= 0.89 (when the tool was created), α= 0.82 (when the study was conducted)

3. **Attitude towards multiculturalism:** This is an owned property regarding the consistent reaction towards the multicultural society and recognize the cultural difference between various cultures[19]. The tool adapted from MASQUE (Munroe Multicultural Attitude Scale Questionnaire[20]) by Kang and Lim[19] was used, excluding questions that overlap with questions from the "Acknowledgment of Multiculturalism" portion. Six questions regarding different cognitions, 4 regarding openness and acceptance, and 4 regarding willingness to get in action were included resulting in a total number of 14 questions. A Likert-type scale was used to rate responses, with 1= highly unlikely and 6= highly likely, with higher scores indicating a more optimistic attitude towards multiculturalism. Validity was measured, with reliability indicating Cronbach's α= 0.89 (when the tool was created), α= 0.92 (when the study was conducted).

4. **Data collection:** The data collection period was from December 1, 2016 to March 1, 2017. Before data collection, all participants were informed about the precautions and the data usage. They were informed that data will be used only for research purposes and will be handled anonymously. The participants provided their written informed consent. Furthermore, 10 pre-surveys were done to ensure that the participants fully understood the survey questions.

   The research was approved by the research ethics review committee in the institution (approval number: KHSIRB-16-071 (RA)).

5. **Data Analysis:** The collected data were analyzed using the IBM SPSS/WIN 21.0 program. The degree of the subjects' general properties, emotional intelligence, acknowledgement and attitude towards multiculturalism were expressed using real numbers, average, and standard deviation. The difference between the three terms were found using the Independent t-test and One-way ANOVA. The relationship between the three terms were analyzed using the Pearson's correlation coefficient, and multiple regression analysis was done to determine the effect of emotional intelligence on the acknowledgement and attitude of the participants toward multiculturalism.

Results

1. The degree of the subjects' emotional intelligence, acknowledgement and attitude towards multiculturalism.

Emotional Intelligence – Out of 7 points, subjects' average = 4.80 ±0.72

Acknowledgement of multiculturalism—Out of 5 points, subjects' average = 3.61 ±0.40

Attitude towards multiculturalism—Out of 5 points, subjects' average = 4.52 ±0.61 (Table 1)

2. The difference between emotional intelligence, acknowledgement and attitude towards multiculturalism based on general properties of subjects

Results showed meaningful differences in emotional intelligence between participants who had experience regarding multiculturalism other than major education and those who had no experience at all. (t= 2.34, p= .020)

Results regarding the difference between degrees of acknowledgement towards multiculturalism regarding the participants' general characteristics showed the

highest results in grade 2 (3.75 ±0.46), followed by grade 3 (3.58 ±0.39), grade 1 (3.56 ±0.40), and grade 4 (3.55 ±0.32) (F= 2.84, p=.039). Participants who had experiences of activities regarding multiculturalism had higher scores than those who had no experiences at all (t=2.30, p=.023). Participants who had received education on multiculturalism other than their majors had higher scores (t= 2.66, p=.009). Those who have friends from different cultures also had higher scores (t=2.01, p=.046).

Questions regarding relations with multicultural societies were answered by 1) *do not know firsthand, but have talked to them* (3.80 ± 0.43), 2) *have known them and lived with them in the same neighborhood* (3.72 ±0.43), 3) *only seen them on TV or in movies* (3.58 ±0.23), and 4) *do not know them firsthand, but have seen them in the neighborhood* (3.56 ±0.40) (F=2.50, p=.044). Results regarding differences in attitudes towards multiculturalism based on participants' general properties showed higher scores in participants who have experienced various practical trainings than those who have not (t=3.97, p<.001). Higher scores were also recorded in participants who have multi-cultural friends (t=2.95, p=.010). Questions regarding contacts with multicultural societies in the previous year were answered by 1) *very often* (3.72 ±0.60), 2) *sometimes* (3.65 ±0.39), and 3) *not at all* (3.52 ±0.34) (F=3.14, p=.046). Questions regarding the necessity of multiculturalism education in the nursing education system were answered by 1) *very necessary* (3.80 ±0.34), 2) *a little bit necessary* (3.54 ±0.40), and 3) *so-so* (3.50 ±0.39) (F=8.17, p<001).

1. **The relationship between emotional intelligence, acknowledgement and attitude towards multiculturalism:** Emotional intelligence is in direct proportion with acknowledgement and attitude (both p<.001), while acknowledgement is in direct proportion with attitude (p<.001). Thus, this means that participants with higher emotional intelligence have higher acknowledgement and positive attitudes, and higher acknowledgement led to more optimistic attitudes. (Table 2).

2. **Factors influencing acknowledgement and attitude towards multiculturalism:** Multi-regression analysis was performed to determine the effects of emotional intelligence on a participant's acknowledgement and attitude towards multiculturalism. The results are shown in Tables 3 and 4.

Along with emotional intelligence, grades, experience of practical training, education experience, existence of multicultural friends, experience with multicultural members, frequency of contacts with them, and necessity of multiculturalism education were independent variables. The results showed the following: Durbin Watson statistics was 2.039, indicating no influence since the number is close to 2; tolerance = 0.661, lower than 0.1; VIF was lower than 10, thus there were no problems in multicollinearity. The analysis using these independent variables were meaningful (F=5.775, p<.001), and estimated the acknowledgement of multiculturalism of nursing students in grade 2, necessity of multicultural education, and emotional intelligence (28.0%). (Table 3)

Along with attitude towards multiculturalism, practical training experience, existence of multicultural friends, experience with multicultural members, and necessity of multicultural education were independent variables. Results showed the following: Durbin Watson statistics was 1.826, indicating no influence since the number is close to 2; tolerance = 0.715, lower than 0.1, VIF was lower than 10, thus there were no problems in multicollinearity. The analysis using these independent variables was significant (F=7.422, p<.001). Influence factors were estimated as practical training experience, necessity of multiculturalism education, and emotional intelligence (24.7%). (Table 4).

Discussion

This study was conducted with the objective of estimating the degree of emotional intelligence, acknowledgement and attitude towards multiculturalism, and finding the correlation between these three terms.

The average emotional intelligence scores of nursing students was 4.80±.72, which is higher than the results shown in Shin and Park's study[13] of 4.76. This was also lower than Song and Shin's study[21], which had an average score of 4.95 although they used the same research tools. Since the emotional intelligence levels are similar in previous studies, this current study demonstrated that nursing education requires care based on empathy and consideration towards patients, as well as emotional intelligence and intellectual areas in caring for patients. Lee and Gu[22] reported that emotional intelligence levels can be heightened through education and training. Thus, an education strategy to enhance emotional intelligence levels is needed for healthcare providers to exert their full abilities in the healthcare field. This is needed for evidence that emotional intelligence is the driving force for nurses to be able to exhibit their professional skills[23]. However, emotional intelligence showed differences based on individuals' social and psychological backgrounds[24].

Thus, for an exact analysis of the degree of intelligence, a comparison study between nurses and other professionals must be conducted. Multiculturalism-related education showed meaningful statistical differences in emotional intelligence levels. However, it was difficult to obtain information on all the lectures organized in each university's education process, therefore this was excluded when performing this study. This section may be improved through further discussion and research. Further, additional studies regarding the effects of multiculturalism related education on emotional intelligence levels and acknowledgement of multiculturalism is needed since this research showed statistical differences in that area.

The acknowledgement of multiculturalism was influenced by practical training experience, the existence of multicultural friends, experience with multicultural members, frequency of contact with multicultural members, and the necessity of multiculturalism-related education. On the other hand, attitude was influenced by practical training experience, existence of multicultural friends, experience with multicultural members, and frequency of contact with multicultural members. Kim and Lim's[25] study indicated this factor being the existence of multicultural friends, and Jeon et al.'s[26] study indicated the factor as being experience with multi-cultural members. These studies both showed similar results with the current study. In the relationship between emotional intelligence, acknowledgement and attitude towards multiculturalism, emotional intelligence was directly proportional to acknowledgement and attitude. On the other hand, acknowledgement was directly proportional to attitude. In other words, acknowledgement could affect attitude, and both could affect emotional intelligence.

The results of this research imply that the influencing factors of acknowledgement and attitude towards multiculturalism are emotional intelligence, necessity of multiculturalism related education, and practical

training experience. First, emotional intelligence is an influencing factor in the acknowledgement and attitude towards multiculturalism, but comparison is difficult due to the lack of antecedent studies[27]. These results showed that for a successful nursing education to be achieved, an education method for heightening emotional intelligence is essential.

Second, since the necessity of multiculturalism-related education is also an influencing factor, acknowledgement and attitude-based education is needed for a suitable approach to diversity in the nursing field[28]. This result is similar to Hwang et al.'s study[29], which showed that multicultural related lectures raised the standard regarding attitudes toward multiculturalism. Therefore, for an effective healthcare and approach, education regarding multiculturalism must be carried out in advance.

Lastly, multiculturalism related practical training is an influencing factor as well. This means that opportunities for nursing students to meet actual multicultural members and interaction with their cultures must be provided during the education process[30].

This study shows significance in the fact that it provided basic information in designing an education process for nursing students to meet multicultural members and gain the abilities to understand them. To raise levels of acknowledgement and attitude towards multiculturalism, examples (North Korean deserters, married foreign residents, emigrant workers), and policies regarding them must be included in lectures, and an education method to raise emotional intelligence must be developed and included as well.

Conclusion

The objective of this study was to find out the relationship between emotional intelligence, acknowledgement and attitude towards multiculturalism through comparison between the significant factors. The final results have shown that acknowledgement and attitude are indeed related. Therefore, emotional intelligence is necessary for healthcare providers to take a flexible stance towards multiculturalism and fully understand it.

For further research, the following must be kept in mind. First, a research to create an education program using emotional intelligence for nursing students and to verify them is necessary. Second, this study used only a few nursing students as study participants, so a general statement cannot be applied to all nursing students. Thus, future research should expand the research bounds.

Acknowledgments: The authors would like to thank the students who participated in this study and shared their experiences with us.

Funding: This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.

Declaration of Conflicting Interests: The Author(s) declare(s) that there is no conflict of interest.

Abstract

Background: Several clinical trials on cancer showed a correlation between elevated levels of regulatory T cells with either poor prognosis or poor response to some therapies. Hence, in this study we tried to measure the regulatory T cells (CD4+CD245+) count and to evaluate the program death receptor 1(PD1) as a one of the main suppressive mechanisms that regulatory T cells use in CML patients with different molecular response to imatinib therapy. Method: Flow cytometry technique was used to analyze 30 sample of optimal molecular response of CML patients (BCR-ABL transcripts ≤ 0.1%) and 30 sample of failure molecular response patients (BCR-ABL transcripts >1%) with or without hematological failure, in order to assess the CD4+CD25+ T cells (Tregs) and PD1 expression on these cells. Thirty samples age and gender matched were used as healthy controls. Results: A high proportion of CD4+CD25+ T cells was found in failure groups compared to control and optimal groups(P= <0.001), while there was no significant difference between control and optimal groups with (P= 0.481). A cutoff value of CD4+CD25+ T cells at >33.7 % was highly significant with high sensitivity and specificity. This value can be used to determine the failure from the optimal CML responders. There was no noticeable differences (P= 0.125) in PD1+ expression among CD4+CD25+ T cells. Conclusion: A high percentage of Treg cells in the failure CML group might be an indication of immune escape of leukemic cells in those patients compared to the other investigated groups.

Keywords: *CML, Imatinib mesylate, CD4+CD25+ Tregs, PD1.*

Introduction

In hematological malignancies, such as chronic myeloid leukemia (CML), CD8+ T cells are down-regulated in patients at time of diagnosis(1), as the immune system becomes impaired favoring immune escape of the leukemic cells(2). CML is characterized by the presence of BCR-ABL fusion oncogene that encodes BCR-ABL1 oncoproteins that have high tyrosin kinase activity (3). Imatinib mesylate, a selective tyrosine kinase inhibitor, is considered the first TKI in CML management, accomplishing high response rates and overall survival, nevertheless; some of CML patients still develop treatment failure(3). The TKI treatment responses are more potent in patients with less exhausted T cells(4). A subset of CD4+ cells defined as a regulatory T cells (Tregs), which are reported as CD4+CD25+, express a high level of CD25+ (IL-2Ra), and can exhibit a suppressive function(5).

Tregs control effector immune cells by humoral and cell to cell contact mechanisms(6). Host environment and PD1 signaling play an important role in Treg development(7). In malignancy, Tregs considered a vital suppressive immunocyte in tumor microenvironment

e-mail: shahlaa_fadhil@yahoo.com

(TME) and are characterized by PD1 and PDL1 expression, and this demonstrated it contribution to the tumor progression [7].

In the CML treatment era, the main goal is to achieve a durable deep molecular response for treatment-free remission to stope TKI therapy. The immunological response and its effect in responder patients of CML may have a substantial value for those with a lack of overt relapse [8]. From other view, the poor immunological response in CML can be part of targeted therapy to induce better response and to control TKI response failure.

Here in this study, we are trying to understand the dynamics of immune escape in CML patients by assessing Treg cells, that express CD4+CD25+ and PD1+ among different molecular response levels of CML patients undergoing imatinib therapy.

Materials and Method

Subjects: This study was conducted between Nov.2018-Dec.2019 at Baghdad Teaching Hospital/ Medical City and The National Center of Haematology. Sixty patients with CML were enrolled in the present study, age >18 years old and on imatinib mesylate therapy for more than 1 year duration. Patients were grouped according to treatment response and the level of BCR-ABL transcripts. Treatment response criteria were defined according to the European Leukemia-Net (ELN) guidelines [9]. Thirty patients were classified as an optimal responders (p210 BCR-ABL transcript levels ≤ 0.1%) and 30 patients were classified as had a failure molecular response to therapy with or without loss of hematological response (p210 BCR-ABL transcript levels >1%). This study was approved by the scientific ethics committee/faculty of medicine, university of Baghdad. Thirty age and gender matched samples without history of hematological or chronic disease were taken as a control group. At time of sampling, blood count indices were obtained and calculated by automated blood count analyzer.

Monoclonal antibodies and flow cytometry analyses: The flow cytometry analysis was performed on peripheral blood at a maximum interval of 24 hours. Fluorescently labeled monoclonal antibodies (mAbs) included [anti-CD45 (FITC), anti-CD4 (APC/CY7), anti-CD25 (APC) and anti-CD279 (PE/CY7)] purchased from (Biolegand, USA), flow cytometry staining was performed according to Biolegend immunofluorescence staining protocol. Data analyzed with DIVA software version 2016 using an immunological gate (SSC/CD45), along with CD4 marker were used to differentiate CD4+T-lymphocyte in all studied groups. At least 100,000 events were analyzed for each sample.

Statistical analysis: Data analysis was done with SPSS 22.0.0 (Chicago, IL). For comparison between different groups, one-way ANOVA is used, and post Hoc Tukey test is used to confirm which groups are significant. Receiver operator curve (ROC) is used to see the validity of Tregs in recognizing failure cases from optimal, ($P \leq 0.05$) were considered statistically significant.

Results

General characterization of Patients and control group: Out of 60 CML patients on imatinib therapy, 30 patients were with optimal response with (mean age 43.47±13.14years; mean disease duration 73.7 ± 37.6 months; M;F ratio 1.72:1) and 30 patients were with failure response with (mean age 50.13±13.61years; mean disease duration 69.4 ± 46.4months; M;F ratio 0.76:1). Thirty healthy volunteer age and gender matched were included and evaluated as control samples with (mean age 46.33±8.84years; M;F ratio 1.14:1).

Patient's characteristics according complete blood count were included: Haemoglobin (mean±SD) levels for the control, optimal response and failure response were (14.00±1.68 g/dL, 12.38±1.59 g/dL and 11.11±2.04 g/dL, respectively) with a significant difference among studied groups as shown in (Fig. 1A).

Regarding the platelets count (pltx10^3/µL), the median for the control group was 312, range (247.3-322.3), for optimal response was 254.5, range (201.3-297.5) and for failure response was 300, range (146.8-559.8), with a significant difference only between optimal responder CML and control group as shown in (Fig. 1B).

The median for white blood cells count (WBCx10^3/µL) for control was 7.63, range (6.65-8.81). For optimal response was 6.0, range (5.15-7.29). For failure response patients was 10.4, range (5.6-27.68), with no significant difference only between control and failure CML response group (P= 0.999) as shown in (Fig. 1C).

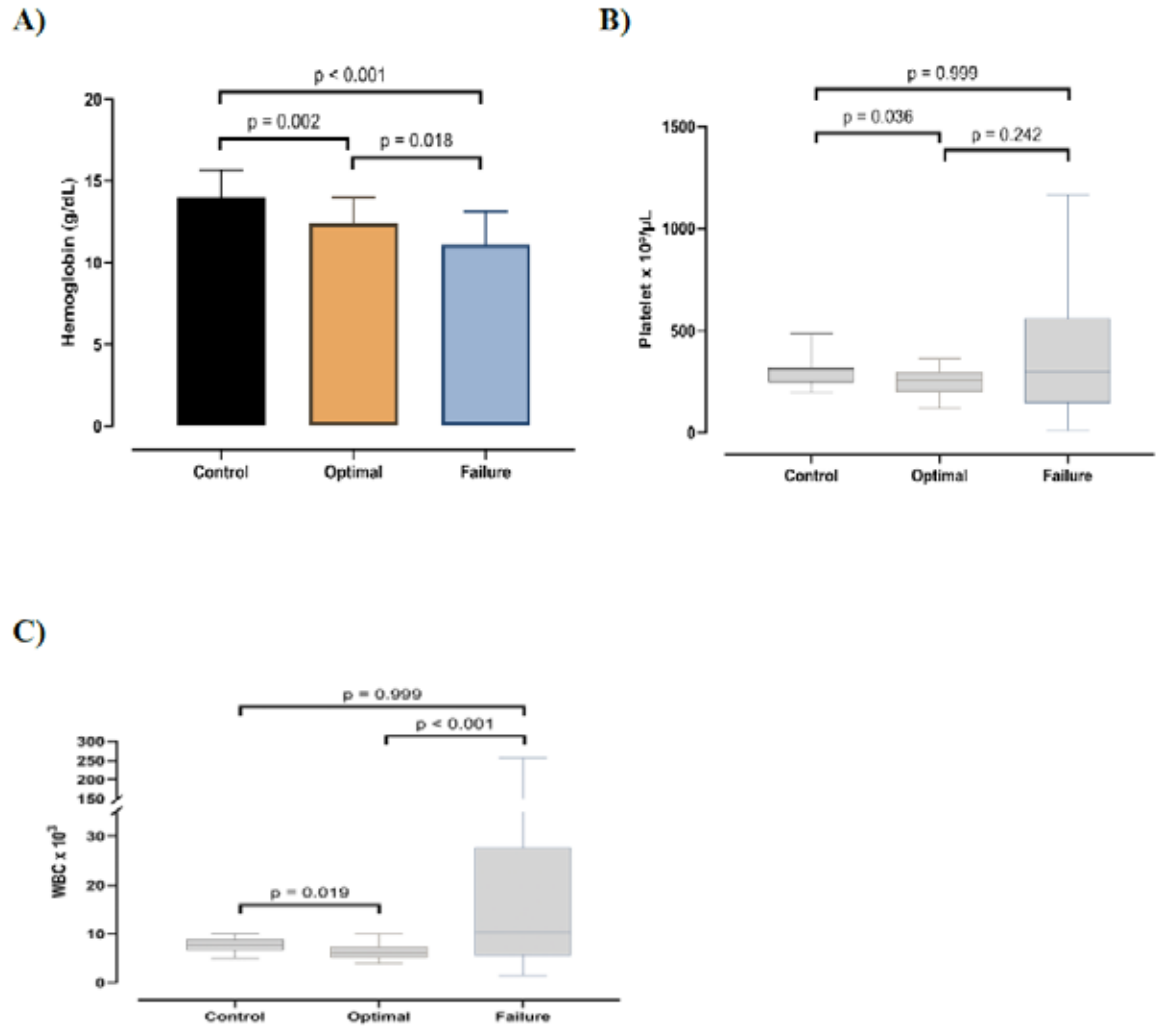

Figure 1: Patients characteristics according complete blood count among different CML groups and control group. A) Hemoglobin levels B) Platelet count C) WBCs count.

All CML cases were categorized according to imatinib therapy response depending on the results of QPCR for p210 BCR-ABL transcripts and peripheral blood indices for each patient. There was a significant difference (P =<0.001) between failure response group with mean (28.4 ± 25.1%) and optimal response group with mean (0.02 ± 0.03%) regarding the BCR-ABL transcript levels. All patients with optimal response were with major molecular response (p210 BCR-ABL transcripts ≤ 0.1%), and 19(63.3%) of them had molecular response with BCR-ABL level (0.1– >0.0032%) log3 & 4 reduction in BCR-ABL1 transcripts levels, while the other responders patients with 11(36.7%) had BCR-ABL (≤0.0032) log4.5 & 5 reduction levels.

Among failure responders patients, there were 93.3% had (BCR-ABL transcripts >1%). 15(50%) out of them had a failure hematological response (FHR) and failure molecular response (FMR), 13(43.3%) had only FMR and there were only 2(6.7%) with BCR-ABL levels between (> 0.1–1%) had FHR.

By the flow cytometry analysis of CD4+CD25+ T cells and PD1 expression among these cells in CML patients treated with imatinib therapy (Fig. 2). The (mean±SD) of CD4+T cells percentage for the control, optimal and failure response patients were (37.70±7.96%, 38.39±8.55% and 35.86±9.55%, respectively) with (P= 0.5). Among these CD4+ T cells the median of CD4+CD25+ Tregs percentage for the control was 8.8, range (4.8-16.2), for optimal response 16.6, range (5.2-50.2) and for failure response patients was 71.7, range (52.0-92.8). There was no significant difference between control and optimal groups with (P= 0.481), while there was a significant increase in percentage of CD4+CD25+ Tregs in failure groups compared to the control and

optimal groups (P= <0.001) for both as shown in (Table 1; Fig. 3).

Regarding PD1expression, data demonstrate no significant differences (P= 0.125) in PD1+ among CD4+CD25+ T cells, although data fail to reach significancy but there was a higher expression in PD1 percentage in failure groups compared to optimal and control groups (Table 1).

Table 1: Assessment of CD4+CD25+ T cells percentage among different CML patients and control group.

Percentage (%)	Control (30)	Optimal (30)	Failure (30)	*P* value
*CD4+	37.70±7.96	38.39±8.55	35.86±9.55	0.511
# $CD4^{+}CD25^{+}$ in $CD4^{+}$ T cells (range)	8.8(4.8-16.2)	16.6(5.2-50.2)	71.7(52.0-92.8)	<0.001
*PD1+ in CD4+ CD25+ cells	65.30±18.88	61.70±18.96	71.60±18.56	0.125

*Presented using their mean ± standard deviation, # Presented using their median (interquartile range)

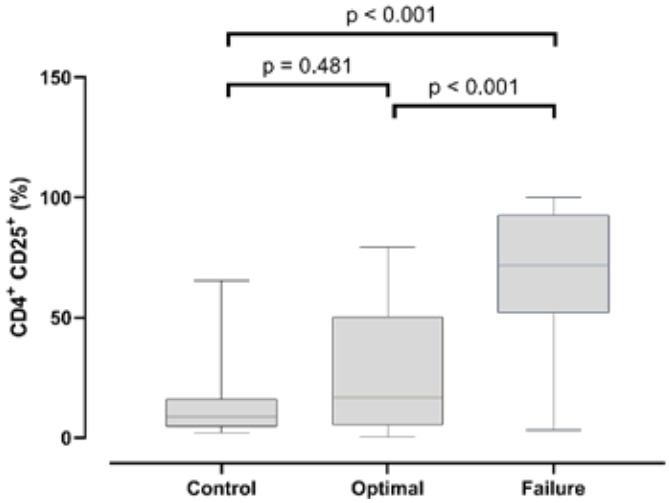

Figure 3: Percentage of $CD4^{+}CD25^{+}$ T cells among different CML groups and control group.

Receiver operating characteristic (ROC) curve analysis was applied in order to determine a cutoff value of CD4+CD25+ Tregs by comparing their percentage among studied groups. Data failed to discriminate between optimal response and healthy control as shown in (Table 2). However, a cutoff value at (>33.7 %) was highly significant with high sensitivity and specificity that can be utilized to discriminate failure from optimal responders as shown in (Table 3).

Table 2: The Roc analysis for CD4+CD25+ Tregs percentage in studied groups

Groups/%CD4+CD25+	AUC	Explanation	95%CI of AUC	*P* value	Cut off %	SN	SP
Optimal vs Healthy	0.619	Poor	0.484 to 0.741	0.115	-	-	-
Optimal vs Failure	0.864	Good	0.751 to 0.939	<0.001	>33.7	96.7	70

Discussion

Imatinib mesylate has an influence on the immune cells that can be both suppressive or stimulating[10]. There is a clear discordance in immune response among CML patients, exemplified by the presence of many patients losing their response during the TKI treatment, whereas some others can develop deep molecular response, making the choice of stopping TKI treatment feasible for those patients [11].

In this study, we include 60 patients of CML with mean age 46.8±13.7, range (18-75) years old, the male:female ratio 1.14:1 which is comparable to ELN 2020 review as a younger age distribution among Asian population was <50 years old [12]. This study showed that the peripheral blood indices were lower in hemoglobin level and higher in WBC counts among failure group compared to the control and the optimal responders groups. This is related to bone marrow suppression by an increased leukemic clone cells due to loss of TKI response and transformation of CML patient to an advanced stage. The optimal responders CML patients also showed a lower hemoglobin level than the control group, which might be linked to the effect of long usage of imatinib treatment as the mean duration of treatment in our cohort where 73.7 ± 37.6 months, this is agree with Moura *et al*., [13]. The median platelets count among all studied groups was within normal range and this doesn't exclude presence of different phases of CML in this study.

Among CML patients with failure molecular response to imatinib therapy, there was significant (P =

<0.001) higher median of CD4+CD25+Tregs (71.7%) in comparison to both optimal responders patients (16.6%) and control group (8.8%), without significant differences between the control group and the optimal responders patients. The presences of Tregs with high median level among non-responders CML patients, may reflect the suppression degree of immune effector cells response to the increased leukemic clone cells, and this may be through contribution of Tregs to inhibit the immune response to the disease activity. Conversely, the optimal responder CML patients showed much lower median level than the patients with failure response to therapy, with non-significant difference with the control group. This might be due to that the leukemic cell burden among the responders patients to imatinib therapy were much lower, indicating the efficacy of treatment that directly or indirectly reduced the Tregs counts and reconstitute the immune function. Our results are in line with Larmonier *et al*., [10] who found through in vivo and in vitro investigations that imatinib therapy decreased Treg frequency and impaired their immune suppressive function. Recent study showed that imatinib treated CML patients in complete molecular remission exhibited selective depletion of effector Treg cells and significant increase in effector memory CD8+ T cells while non-complete molecular remission did not [14].

Moreover, studies showed CD4+CD25+ Treg cells depletion reinstated an efficient anti-tumor immune response leading to complete tumor regression[15]. The possibility that the function of Tregs may also influence patients with cancer has been suggested by previous studies on CLL[16] and lymphoma malignancies[17]. Therefore, in relation to CML disease, the immunosuppressive properties of regulatory T cells seem to be particularly important in disease control status.

Our study established a cutoff value of CD4+CD25+ T cells at >33.7% which might be a good biomarker to distinguish between failure and optimal responders to TKI treatment.

In present study, the data analysis didn't show noticeable difference in mean levels of PD1 expression on Tregs among the studied groups, despite the higher mean level in failure responders CML patients. This may relate to the extent of PD-1 mediated inhibition depending on the strength of the TCR signal, where as PD-L1 expression on non-lymphoid tissues and its potential interaction with PD1 may subsequently determine the extent of immune responses[18]. Park *et al*.,[19] suggested that PD1 expression in Tregs and the PD1/PDL1 interplay is responsible for T cells exhaustion and can inhibit their proliferation and cytokines releasing.

Conclusion

CML disease undergoing TKI therapy is immune responsive disease, this response determined by the degree and type of CML molecular response, which may play a vital role in controlling the disease activity in advanced stage and deeper molecular response in patient who achieved MMoR. Our observation highlights the importance of Treg function and its interaction with PD1 among CML patients. Furthermore, our findings might turn the focus of the new therapies towards targeting these escape mechanisms.

Effect of Segmented Sleeping on the Academic Performance of Medical Students. A Questionnaire Survey

Shalini S.P.[1], Balaji K.[2], Yuvaraj Maria Francis[3], Gunapriya Raghunath[4], Vijayalakshmi S.[5]

[1]Phase I MBBS, Saveetha Medical College and Hospital, Thandalam, Chennai, India, [2]Tutor, Department of Anatomy, Saveetha Medical College and Hospital, Thandalam, Chennai, India, [3]Assistant Professor, Department of Anatomy, Saveetha Medical College and Hospital, Thandalam, Chennai, India, [4]Professor & Head, Department of Anatomy, Saveetha Medical College and Hospital, Thandalam, Chennai, India, [5]Professor, Department of Anatomy, Saveetha Medical College and Hospital, Thandalam, Chennai, India

Abstract

Background: Sleep is a basic need of every individual, essential for a better quality of life and performance in the activity of daily living. Humans spend a third of their life sleeping. Even then, sleep disturbance is the common health issue in modern society which promotes late-night gatherings and shift-based work. Segmented sleep is one or many naps with one core sleep where the awake period also takes place in two or more sessions. Segmented sleep is considered to be an unhealthy practice today, is the way that our ancestors slept until the last few centuries.

Aim and Objectives: The study aims to assess the effect of segmented sleep patterns among medical students and correlating it with the academic performance of them.

Method and Materials: This study was done on 300 students with both male and female participants. A questionnaire was developed after the elaborated discussion and circulated among the students. The data was then analyzed using Microsoft Excel 2010.

Results: The overall quality of the sleep, regardless of how long participants slept was highly satisfactory in 61% and about 47% of participants spend 6–7 sleeping hours. Segmented sleeping among the participants has a positive impact on academic performance which was both, directly and indirectly, related to the amount of time spent by the participants in their studies.

Conclusion: Segmented sleep is the most natural way of treating sleep deprivation among the adolescent. Therefore, the segmented sleep pattern can be inducted in the daily schedule and then modifying to suit the individual's lifestyle.

Keywords: *Academic performance, Adolescence, Segmented Sleep, and Sleep deprivation.*

Introduction

Sleep is the natural phenomenon that occurs in every individual when the body and mind undergo a temporary state of rest. The individual is physically dormant and consciousness is suspended where the awareness about the environment is reduced. An average healthy individual spends approximately one-third of the life in sleeping and a normal individual need between seven to nine hours of sleep per day to stay healthy and function properly. Sleep is one of the four basic physiological needs namely hunger, thirst, sex, and sleep. The occurrence of sleep in the individual is still a mystery. Sleep has many functions such as development, growth, differentiation, repair, and learning or memory

consolidation, which occurs throughout the life span.[1] Adequate sleep plays an important role in the physical and mental wellbeing of the individual especially enhances the cognitive skills, memory retention, levels of concentration and performance of all the activities. Eight hours of continuous sleep in a day of an individual is considered a normal sleeping pattern and it is also known as monophasic sleep. However, there is also an alternative to normal sleeping patterns, called polyphasic or segmented sleep, which is one or many naps with one core sleep. The factors determining the sleep include sleep patterns, number of naps, core sleep length, and the time intervals. Any disturbance in these factors may lead to sleep deprivation, fails to get required sleep. The prevalence of sleep disorders ranges from 22% to 65% in the general population and about 28% of the medical students have insomnia symptoms.[2-4] An increased risk of sleep deprivation was reported in medical students.[5] Adequate sleep is positively linked with the general well-being of the individual and their performance in day to day activities.[6,7] Sleeping pattern of the medical students is an important factor for successful academic performance. Hence this study was done to investigate the effect of segmented sleeping on the academic performance of medical students.

Method and Materials

This cross-sectional study was done from 2019 to 2020 academic year in the Department of Anatomy, Saveetha Medical College and Hospital, Saveetha Institute of Medical and Technical Sciences, Chennai after getting institutional ethical committee approval (Approval No: SMC/IEC/2020/03/143). The participants were 300 medical students from phase I and II MBBS. A questionnaire was developed and finalized after the elaborated and repeated discussion which was later circulated among the students. The questionnaire was designed with informed consent and questions enquiring about the demographic profile, total sleep time per day, number of naps in a day, sleep latency,and total study hours per day. The data was then analyzed using Microsoft Excel 2010.

Results

Out of 300 students, 183 (61%) were females and 117 (39%) were males. The mean age was 18.9 years with a range of 18 to 21 years. Among the participating students, 55.9% stay in the hostel provided by the educational institute itself, 35.3% are day scholars and 8.8% resided out-campus such as paying guests and rented houses near the campus.

About 47% of participants spend 6 – 7 sleeping hours, 32% of participants spend less than 5 hours, 12% spend about 8 – 9 hours and a small number of students (9%) spend more than 10 hours in sleeping on weekdays, during weekends, all the participants spend 1-2 hours excess in sleeping (Figure 1).More than half of the participants (56%) suffer from slight to moderate delay in sleep induction, time taken to fall asleep during night time and 2% of the participants suffered a severe delay in sleep induction. The overall quality of the sleep regardless of how long participants slept was highly satisfactory in 61%, moderately satisfactory in 37%, and unsatisfactory in 2% (Figure 2). Similarly, participants had issues in awakening after sleep (27%) and awakening during sleep (28%).

The majority of the participants(56.1%) spend less than 5 hours of sleep in a night time. The interesting finding was that 85.1 % of the participants have the habit of sleeping after the college hours and 50% of them were involved in the post-lunch nap. 32.4% of the participants know about segmented sleeping. Among the hostelers, 86% of the participants practice segmented sleep, whereas only 53% of the day scholars practice it. (Figure 3)

Less number of participants (11.8%) practice segmented sleeping and among them, 45.1% of participants positively responded that segmented sleeping helped to spend extra time in studies.

On comparing different correlates with participants segmented sleeping, it was found that segmented sleeping had a better impact on the academic performance which was both, directly and indirectly, related to the amount of time spent by the participants in their studies. (Table 1) It was also found that segmented sleeping was a better determinant of performance than the monophasic sleep where participants had a single continuous one, regardless of the number of hours spend on sleep.

Participants,who practice monophasic sleep, also had excessive daytime sleepiness 52% which affected their day to day activities including academic performance. Whereas participants who practice segmented sleeping had reported only 8% excessive daytime sleepiness.

Discussion

Segmented sleeping is human's naturally evolved system, well-practiced by ancestors for a long time which was scientifically proved among Romans.[8] The study done by Barbato G et al 1994 demonstrated the experiment on 14 individuals in which the body reverts to a segmented sleeping on the induction of removal of modern lighting.[9] The prevalence of sleep disorders is common in females than males, the gender difference is mainly due to men report adverse effects of sleep quality, whereas females more specifically concentrate on a single symptom.[10] The sleep pattern among medical students on working days and holidays that students slept for more than 8 hours and there was a significant change in the sleep initiation which happened after midnight and wake up the late morning the next day which is normally seen in adolescents. A shift of about 2hrs from the normal is seen in these subjects.[11-13]

In 2017, Philips reported negative linear correlations between academic performance and sleep patterns.[14] Medical students who scored "A" in their academic examination had a higher sleep duration when compared with "B" and "C" scoring students.[15] This significant difference between the students does not explain the students sleeping pattern whether it was monophasic or segmented sleeping. Hence the increase in mean sleep duration with segmented sleeping may also increase academic performance. The modern trend of participating insocial gathering for recreation especially late-night gatherings lead to change in the sleeping patterns among different classes of the society. Further, monophasic sleep used by those who went to sleep later may still have been the segmented sleeping pattern in their second sleep.[16]

Genzel et al. reported a significant correlation between sleep quality during the semester and the pre-clinical board exam performance among medical students. Further, the sleep quality after the board exams for the next year was investigated where the relationship could not be determined. In another study by the same author also concluded that the relationship between sleep quality during the semester and the academic performance in the board exam could not be determined.[17] The limitations of this study are excluding a few factors such as academic stress, and personal issues which may affect academic performance. Moreover, this study was conducted with participants of only one medical college which need to be elaborate to more sample size. The results of this study are very peculiar. Most participants with lower academic performance found to have monophasic sleep which with short sleep duration may affect sleep quality, sleep efficiency, and sense of sleepiness almost every day. Participants who practice segmented sleep scored better in academic performance were able to get adequate sleep, better sleep quality. Hence with the proper and correct way of segmented sleeping, the academic performance of the students can be improved.

To summarize, the present study evaluated the relationship between academic performance and segmented sleep. The results could show that sleep quality was linked with academic performance. Medical students who suffer from sleep quality issues, which have so far been underestimated health issues should be addressed with segmented sleep pattern with the proper method to improve the academic performance and overall well-being.

Conclusion

Sleep deprivation is one of the most common health issues among adolescents in modern society which is also a cause of poor academic performance. Segmented sleeping can be an answer to achieve better academic performance when it is practiced properly. The students, teaching faculties, and health professionals need to understand the role of segmented sleeping to improve academic performance. The educational institution should appoint a student psychologist who is also a sleep expert for counseling the students about the importance of quality sleep by segmented sleep for better academic achievement and a healthy lifestyle.

Table 1: Showing the academic performance of participants based on their sleeping pattern

Marks in Percentage	Monophasic sleep (%)	Segmented Sleep (%)
> 80	2	1
60 - 80	12	19
40 - 60	23	28
< 40	9	6

Study *ndvB* gene Expression in *Pseudomonas aeruginosa* Producing Biofilm

Shamam Tahseen Ismail[1], Mohammed Ibraheem Nader Altaai[2]

[1]Researcher Scholar, [2]Professor, Institute Genetic Engineering and Biotechnology for Post Graduated Studies, University of Baghdad, Designation Department of genetic engineering in institute of genetic engineering and biotechnology for post graduated studies, university of Baghdad, Adress Iraq-Baghdad-Al-Jadiriya-University of Baghdad

Abstract

Pseudomonas aeruginosa have ability to form biofilm, this biofilm responsible for wide infections and antibiotic resistance development. A novel mechanism to antibiotic resistance mechanisms utilized by biofilm represented by the presence of *ndvB* geneencodes a glucosyltransferase enzyme involved in the formation of this glucans, thisglucan mediated sequestration antibiotic away from their cellular targets. In this study was collected 145 samples from burns patients and identification by biochwmicaltsets and Vitek-2 compact. The studied the biofilm formation was measured using micro titer plate method we found that 49 isolates (100%) of *P.aeruginosa* were biofilm positive and measured minimal biofilm inhibitory concentration(MBIC) of biofilm *P.aeruginosa* positive biofilmused cefepime as antibiotic was tested using microtiter plate microdilution method (MBIC) values (1gm/ml).Molecular detection of *ndvB* gene was measured using PCR 100% of isolates were found to contain *ndv B* gene. Expression of *ndvB* gene was significantly high in biofilm isolates using sub- MBIC values of cefepime. Expression of *ndvB* gene was significantly high in biofilm isolates using glucose with concentration 1% and 2%. This study we concluded biofilm formation is an important trait of *P.aeruginosa* that isa cause of antibiotic resistance. *ndvB* gene expression responsible for the biofilm resistance mechanism in *P. aeruginosa* biofilms.

Keywords: *Pseudomonas aeruginosa, ndvB, biofilm.*

Introduction

*Pseudomonas aeruginosa*is as an opportunistic pathogen that give rise to a high rate of mortality and morbidity in hospitalized patients with compromised immune systems and infections are being very hard to be treated, because of the increasing number of antibiotic resistant strains, becoming one of the main problems in hospitals(1). *P.aeruginosa* is capable to compose biofilms in numerous surfaces, biofilms promote the bacterium to adhere and survive on the surfaces and medical devices(2). Biofilms are micro colonies composed of multiple microbial species like as community organization leading to stay survival in harsh conditions, bacterial cells of biofilm are more resistant than planktonic cells(3). The insistence these microorganisms in the environment can provide as a source of transmission in the hospital environment(4). The biofilm contain matrix has been contain a mixture of polymers, including: nucleic acids extracellular DNA (eDNA),proteins and polysaccharides. Exopolysaccharide matrix that borders the cells in the biofilm prevents spread of the antimicrobial agents through the biofilm and keep the cells of the biofilm in community together(5). Biofilm contains many genes *ndvB* geneis one of these genes protect biofilmcells from antibiotics. The *ndvB* gene, encodes theglucosyltransferase enzyme that responsible for the formation of cyclic glucans, the glucans are cyclic polymers of 12 to 15 β- (1→3) linked glucose molecules with phospho glycerol substitutions(6). This study aimed to detection of the biofilmformation,

antibiotic susceptibility pattern of *P.aeruginosa* isolated from clinical samples and measure the gene expression of *ndvB*gene among isolates forming biofilms.

Materials and Method

Bacterial Isolates: In this study, a total of (145) samples (swab) were collected from patients suffering from burns. A total of samples was collected from (Medical City Specialist and Al-Yarmook General Teaching Hospital), The isolates were collected during the study period from initial November/2019 finished in the end of February/2020.

Sample collection and bacterial identification: All samples were cultured onmultiple media (Blood agar, MacConkey agar and Cetrimide agar) were used to identify the bacteria, pure colonies with appropriate of the phenotypic characterization based on physiological, morphological, and further tested by conventional biochemical tests including catalase test, oxidase test, Lactose fermentation test, Hemolysin production test, Pigment production test and growth at 42°Cleading to identification as *P.aeruginosa*.

Antibiotic susceptibility testing

Antibiotic susceptibility testAST of all isolates was determined by Vitek-2 automated susceptibility testing system using GN-AST cardsto all 49 *P.aerugenosa*isolates against twelve antimicrobial agents : amikacin, tobramycin, gentamicin, cefepime, ceftazidime, imipenem, meropenem, ciprofloxacin, ticarcillin–clavulanic acid, piperacillin and colistin. These isolates showed different susceptibility**.**

Biofilm susceptibility assay: *Pseudomonas aeruginosa* biofilmwere measure by microtitre plate method to determine biofilm production. In this method, the *P.aeruginosa* isolates were grown overnight at 37C in Mueller-Hinton Broth (MHB) containing 1% glucose. Then, microtitre plates were inoculated with 125 µl bacterial suspension adjusted to 0.5 McFarland**.** Microtiter plate were incubated at 24 hrs at 37°C. After biofilms formed on the walls of micro titer plate are stained with 150 µl of 0.1% crystal violet for 10 min. Then, plate washing twice with phosphate-buffered saline (PBS) (pH 7.2) to discharge crystal violet stain. After air drying process of wells of microplate. The microplate is re-solubilized by 150µl of 95% ethanol. Then, plate was measured at 570 nm by a microtiter plate reader[7]. According the optical density of the samples were classified Mean OD value (> 0.240) as strong biofilm,(0.120 - 0.240) as moderate biofilm and (< 0.120) as weak biofilm[8].

Determination of minimum biofilm inhibitory concentration (MBIC): After forming biofilms on 96-well plates previously described[7]. The minimum biofilm inhibitory concentration (MBIC) were measured. Preparednine folds dilutioninthe different range (100mg/ml, 10mg/ml, 1mg/ml, 0.1mg/ml, 0.01mg/ml, 0.001mg/ml, 0.0001mg/ml, 0.00001mg/ml, 0.000001mg/ml). The antimicrobial agent cefepime, were diluted using Mueller-Hinton broth (MHB). Then, added 100µl of each serial fold dilutions of antibiotics concentration into the each wells of the plates. Negative control contained only as sterility MHB.All the plates were incubated at 37°C for 24 h. After incubated the microtiter plate was washed with sterile water. Then, themeasured optical density at 650 nm was measured after incubation. TheMBIC was determined as the concentration at which the absorbance is equalto or less than that of the negative control[9].

Polymerase chain reaction (PCR): The amplified *ndvB* gene were by PCR using a specific primer Forward (5′-GGCCTGAACATCTTCTTCACC-3′) and (5′GATCTTGCCGACCTTGAAGAC-3′) Revers[10]. Amplification of *ndvB*gene were performed the amplification of *ndvB* gene was performed as follows: initial denaturation step at 95˚C for 5min (one cycle), followed by 30 cycles consisting of denaturation at 95˚C for 30s, annealing at 56˚C for 30s and extension at 72C for 30s, and finalextension at 72 C for 10 min. The PCR products were visualized following electrophoresis on 1% agarose gels and staining with ethidium bromide.

quantitative real-time PCR (RT-qPCR): It was used to measure the expression of *ndv B* gene to antibiotic resistance after treated with it has been used the concentration (0.0001) as sub-inhibitor MBIC. After that, RNA extraction was done using general RNA extraction kit (Promega, USA) according to manufacture instructions. Tomeasure the *ndvB* gene expression, a pair ofprimers specific for *ndvB*gene Forward (5′-GGCCTGAACATCTTCTTCACC-3′) and (5′GATCTTGCCGACCTTGAAGAC-3′) Reverse[10]. For a control the primers Forward(5′CCTGACCCGTCGCCACAAC-3(′and Re verse(5′CGCAGCAGGATGCCGACGCC-3′)were used to amplify and quantify mRNA of the expressed

bacterial *gyrB* gene[11]. The qPCR real-time PCR) was programmed as following; 95°C for 15 min and 40 cycles each cycle consists of 95°C for 60sec, 56°C for 30sec and 72°C for 30sec. After adding glucose in concentration (1% and 2%). The measure expression of *ndv B* gene after treated with glucos at concentrations of 1% and 2%, the same *ndvB*, control primer *gyrB* gene and the programs were used.

Findings: The study period, 49 *P.aeruginosa* isolates were identified from 145 clinical specimens from burns patients. The antibiotic susceptibility patterns of the *P. aeruginosa* isolates by Vitek-2 compact that (57.14%) of the isolates were Multi-Drug Resistant (MDR). It was found that, among 49 isolates of *P.aerugenosa* isolates.

The results of resistance to antibiotics percentage among isolates show in (table 1).

Table 1: These isolates showed different susceptibility towards these antibiotics

Type of antibiotic	No & percentage (%)
Ticarcillin	40 (81.65%)
Ticarcillin-clavulanic acid	40 (81.65%)
Piperacillin	40 (81.65%)
Cefepime	38 (77.55%)
Amikacin	36 (73.50%)
Tobramycin	36 (73.50%)
Gentamicin	36 (73.50%)
Meropenem	36 (73.50%)
Ciprofloxacin	32 (65.30%)
Imipenem	28 (57.14%)
Ceftazidime	24 (48.96%)
Colistin	49 (100%)
Chi-square (χ^2)	9.891 **
P-value	0.0001

** (P≤0.01).

After measuring 49(100%) from 49 isolates were biofilmpositive were used microtiter tissue culture plate method. Where it is found 4 moderate biofilm and 45 strong biofilmas shown in (table 2). The minimum biofilm inhibitory concentration (MBIC) (0,0001mg/ml) of cefepime against 49 positive biofilm measured by using microtiter plates serial dilutions method.

Table 2: *Pseudomonas aeruginosa* isolates ability to produce biofimby using (MTP) method

Biofilm produce	No	Percentage
Strong (+++)	45	91.8 %
Moderate (++)	4	8.8 %
Total	49	100 %
Chi-square (χ^2)	---	14.286 **
P-value	---	0.0001

** (P≤0.01).

According to PCR *ndvB* gene were found in 49 (100%) from the 49 *P.aeruginosa* isolates. Then, study of gene expression was conducted by select 5 *P.aerugenosa* isolates. The study showed that increase gene expression of *ndvB* gene to the highest biofilm and moderate biofilm according to method (MTP), after treated with the cefepime using a concentration (0.0001gm/ml)the dose of sub-MBIC. Furthermore,increase gene expression of *ndvB* gene to the highest and moderate biofilm which measured the to5isolates were tested after treated with glucose using a concentration (1% and 2%).

Discussion

The present study showed(2) that *P.aeruginosa* isolates responsible for burnsinfenctions that occur in hospital and the emergence of resistant *P.aeruginosa* infections and resistance to antimicrobial agents make it considered is Multi-Drug Resistant (MDR)this is agreement with Emamiet al.[12].

The results of resistance percentage among isolates, to sub-catogeries, the highest prevalence of resistance to antibiotic was detected with Ticarcillin 40(81.65%), Ticarcillin-clavulanic acid 40(81.65%), Piperacillin 40(81.65%), Cefepime 38(77.55%), Amikacin 36(73.5%), Tobramycin 36(73.5%), Gentamicin 36(73.5%), Meropenem 36(73.5%), Ciprofloxacin 32(65.3%) were respectively, but less with Imipenem 28(57.14%), and Ceftazidime 24(48.96%) respectively and all *P. aeruginosa* 49(100%) of isolates sensitive with colistinthis is agreement with

Memar et al[13] because of *P.aeruginosa* have high intrinsic resistance to toxic molecules surrounded toxic molecules by a poorly permeable of the outer membrane that allows extrusion mechanisms, such as efflux systems are able to export antibiotics and thus, to

impair the interaction of drugs with their cellular targets. At least four efflux pumps of the resistance-nodulation-cell division (RND) family can significantly increase the resistance of *P.aeruginosa* to antibiotics when overproduced upon mutations[14].

The ability all isolates of *P. aerugenosa* to produce biofilm was detected by using standard microtiter plates. All *P.aeruginosa* isolates had the ability of biofilm production. The association between biofilm formation and antibiotic resistance revealed that biofilm production was significantly higher among MDR *P.aeruginosa* isolates this agreement with Abidiet al[15]. The results showed determine the minimum biofilm inhibitory concentration MBIC value ofcefepiemto the 49 *P. aerugenosa*isolates(1gm/ml). The highest antibacterial effect against biofilm of *P. aerugenosa* isolates by an absorbance values were able to kill 100% of all biofilm isolates in a 24 h after the treatment with cefepiem were compared with the absorbance values of the control, cefepime demonstrated excellent activity against *P.aeruginosa* this result was in agreement with Khan et al[16].

The PCR tests of *ndvB* gene confirms the occurrence of *P. aerugenosa* gene in mainly in all clinical isolates this agreement with Hall et al[17]. The gene expression of *ndvB* gene increasedafter the treatment with the cefepiem because of*ndvB* gene has a new resistance mechanism throughformation of periplasmic glucans. These glucans function in biofilm-specific antibiotic resistance prevents cell death by sequestering antibiotic molecules in the periplasm and away from their cellular (cytoplasmic) targets[5]. While the gene expression of *ndvB* gene increased after the treatment with the glucose 1% and 2%. The glucose stimulate the expression of *ndvb*gene therefore, the expression increased of*ndvB* gene when used of glucose after treatment, this study is compatible with we investigated[18]. The glucose increase biofilm formation ability of *P.aeruginosa*, this is because of the *ndvB* gene encodes theglucosyltransferase enzyme that responsiblefor the formation of cyclic glucans. The glucans are cyclic polymers of 12 to 15 β- (1 → 3) linked glucose molecules with phospho glycerol substitutions[6].

Conclusion

The ability of *P.aeruginosa* to form biofilm that cause of antibiotic resistance, sub-inhabitor MBIC to cefepime of biofilm positive *P.aeruginosa* isolates to was associated with increased *ndvB* gene expression and increased glucose molecules in biofilm leads to increasesd ability of *P.aeruginosa* to form biofilm therefore,increased *ndvB* gene expression.

Prevalence of Child Physical Abuse among School Children in Mosul City\North of Iraq

Shatha Abdul-Rahman H. Al-Ghurairi[1], Eman Al- Khafaf[2], Hana A. Al seed[3]

[1]PhD Community Medicine, Lecturer, Clinical Nursing Sciences Department, Nursing College, Mosul University, Iraq, [2]Msc Nursing Psychiatry, Lecturer, Clinical Nursing Sciences Department, Nursing College, Mosul University, Iraq, [3]Bsc. Nursing, Clinical Nursing Sciences Department, Nursing College, Mosul University, Iraq

Abstract

Background and Aims: Physical abuse is the most critical problem in Mosul city children and the extent of physical abuse is currently unknown. Aim of this study to determine the prevalence of physical abuse among sample of Mosul schoolchildren, aged 12–18 years.

Material and Method: A cross-sectional study was carried out from 1st, December 2018 to 4th March 2019. The settings chosen by multicultural sampling with a systematic sampling technique of 800 child (396 male and 404 female) using a self-reported questionnaire.

Result: A total of 800 intermediate school children, age group 14-15 years represent 43.6%, male to female ratio 1:1, 36.1% of these had experienced physical abuse and 32.6% abused by mothers. The relationship between the parent educations and father's job shows high significant rate 0.000, 0.004.

Conclusion: physical abuse Mosul city had high prevalent in comparison with others. Psychological and physical problems of children were the main predictors.

Keywords: *Physical abuse of children, violence against children, Mosul City.*

Introduction

Our children are often faced with choices that affect their development and safety. One way we do this is to talk with our children[1,2]. Child abuse defined as physical injury, emotional abuse, sexual abuse or non-accidental injuries or trauma inflicted on a child by another person were an active act of maltreatment of children, which can take place in several settings: at home, at school, in the streets, in the workplace[1]. A safe environment that supports and promotes children, dignity and development. More than 3 million reports of child abuse are received each year, including half a million reports of child sexual abuse. As a major youth-serving organization[1].Parental intimate and partner violence is strong evidence for an overlap between child physical abuse and intimatepartner. Child physical abuse (CPA) injuries can include bruises, broken bones, burns, and abrasions. CPAhappens in all age groups; however, youth ages 12 to 17 have the highest rate of injury from physical abuse[3,4,5,6]. The youngest children are the most sensitive to violence and injuries can become severe and cause lifelong consequences or even be life threatening. Shaken baby syndrome and Munchhausen by proxyare examples of such severe types of CPA against small children[1,3,7,8].Factors associated with the CPA are: The proportions of male/female perpetrators are often equal in survey studies[5,9,10,11,12]. Addiction and mental disorders/mental functional disorders could lead to poor impulse control. Parent's own history of abuse as a child now seems to be partly broken in Sweden[13].Parental support for corporal punishment has a powerful predictor of violence against children [3,4,5,6]. Financial difficulties, parental educational level, unemployment, low socioeconomic status,traumatic experiences of war,medical health problems and single-parent households are all well-known conditions that have been reported as risk factor[4,5,6,7,8]. Younger children are more often subjected to abuse than older children are: Disability/chronic disease, behavioral problems are aggressive outbursts, disobedience, attention deficits and other externalizing problems,poor

health status, poor mental and/or physical health in adulthood[8,9,10,11,12,13,14].

The objectives of this survey was to measure and describe the CPA aged 12–18 years old, assess differences in the abused children by gender, age, socioeconomic status, parental education, to distinguish the type of response of the child to the insult.

Methodology

Prior to the actual collection date, a formal administrative approval was obtained. A descriptive cross sectional design was carried out from 1st December 2018 to 4th March 2019. The data was collected from intermediate school (boys and girls). The setting chosen by multicultural sampling taking the most crowded schools in public low and high socioeconomic discrete overall of the left and right sides of Nineveh province. A systematics amp ling technique (every three child) were chosen from the school setting's consisted of(800) child. This divided into(396) male and (404) female through interviewing with children. Data collection form is constructed after reviewing many articles written on this topic. To ensure the validity of the study questionnaire,method and procedures proposed to carried out before the beginning of collection of sample so 6 experts in different specialists related to the field of the present study were chosen. They were asked to review the questionnaire for clarity and adequacy in order to achieve the present study objective. Most of them had agreed that the questionnaire were clear, relevant and adequacy, certain modification were employed based on the experts recommendations and suggestions. Collection and data analysis is done by the researcher manually. Tabulated and presented in a descriptive form. Percentage and chi square are used in calculation and description of the results by SPSS Program version 25.

Results

Table 1: Social and demographic characteristics of study sample

Demographic Characteristics	Estimate	Freq.	%
Age	12-13 years	220	27.5
	14-15 years	349	43.6
	15 years and above	231	28.9
Gender	Male	396	49.5
	Female	404	50.5
Type of Family	Single Family	505	63.1
	Multiple Family	295	36.9
Number of the children in the Family	2-3	106	13.3
	4-5	254	31.8
	5 or more	440	55.0
Type of Housing	Possess	525	65.6
	Rent	275	34.4
House Rooms	1-2	169	21.1
	3-4	491	61.4
	5 or more	140	17.5
Total		**800**	**100.0**

Table 1:shows that age group 14-15 year represent 43.6%. male to female ratio approximately 1:1.

Table 2: Abuse characteristic of the study samples

The Abuse Children	Estimate	Freq.	%
Child Abuse	Not Abused	511	63.9
	Abused	289	36.1
Who Hits the Child	Father	230	28.8
	Mother	261	32.6
	Brothers	188	23.5
	Sisters	42	5.3
	Friends	55	6.9
	In School	24	3.0
Age of the child when started he\ she hits	1-2	150	18.8
	3-5	101	12.6
	6-8	147	18.4
	9-12	198	24.8
	13-15	139	17.4
	16 or more	65	8.1
Why the child hits	Study	332	41.5
	Bad manners	167	20.9
	Others	301	37.6
The child trust	Parents	496	62.0
	Friends	123	15.4
	None	181	22.6
Total		800	100.0

Table 2:36.1% is the prevalence of abuse in family sample and 32.6% of children abused by their mothers.

Table 3: Psychological and medical problem of the study sample

The Problems	Estimate	Freq.	%
The child have psychological problem	Yes	215	26.9
	No	585	73.1
Psychological problem	Non	585	73.1
	Speech difficulty	21	2.6
	Aggressive	17	2.1
	Depression	17	2.1
	Escape from school	116	14.5
	Others	44	5.5
The child have medical problem	Yes	213	26.6
	No	587	73.4
Medical problem	Non	587	73.4
	Difficulty concentrating	120	15.0
	Disability	5	.6
	Epileptic fit	5	.6
	Hereditary	43	5.4
	Thalassemia	36	4.5
	Incontinence	4	.5

Table 3 shows that children not have psychological and medical problem in 73.1% and 73.4 respectively.

Table 4: The child response after hits of the study samples

Type of Child Response	**Freq.**	**%**
Social withdrawal	223	27.9
Refuse eating	203	25.4
Hostility Towards His Family	67	8.4
Hurt himself	29	3.6
Escape from school	69	8.6
Indifference	146	18.3
Other	63	7.9
Total	**800**	**100.0**

Table 4 shows the child response after hits the children for family in the study is social withdrawal in 27.9%.

Table 5: The relationship between the parent educations, Jobs with child Abuse

Parent Educations	**Items**	**Not Abused**		**Abused**		**Chi-seq.**	**P.value**
		Freq.	**%**	**Freq.**	**%**		
Father Education	Illiterate Stage	49	9.5	26	9	34.95	0.000
	Read and write Stage	109	21.3	74	25.6		
	Elementary Stage	32	6.2	37	13		
	Intermediate Stage	118	23	25	8.6		
	Junior high Stage	79	15.5	40	13.8		
	Graduate Stage	124	24.5	87	30		
Mother Education	Illiterate Stage	18	3.5	30	10.3	62.27	0.000

Total		**511**	**100.0**	**289**	**100.0**		

Table 6 shows that highly significant with family income, presence of stress at work, absence of father, and alcoholic father.

Discussion

The home is supposed to provide support and safety for children but can also be the place where children suffer abuse and other adverse treatment by their parents. To the best of our knowledge, this article is the first published the extent of CPA in Mosul city. In such circumstances primary and intermediate schools provide a best numerical indicator. What is taken for granted in Iraq could not be assumed neither in western countries, higher income countries and more developed countries nor in other developing countries, because of impact of wars, embargo and disasters. Thus, the findings of the present study may differ if it is compared with other findings taken in another period of time or another place. Therefore, the figure of prevalence of CPA in student 36.1%. This study which could be quite helpful indicator of the problem of CPA in student in Mosul City. Review of the literature revealed a wide range of reports regarding the prevalence of CPA in children. Globally,prevalence of reported CPA varies from 2% to 62%[14,15]. In US In 2006, 16%. In 2008 It's very likely that many more children are physically abused than the number that are reported[12,16,17].In 2015, 63.4% were alleging child abuse and neglect[11]. This is correlated with the present study.

Our study shows 1:1 ratio similar gender distribution of CPA. In Sweden was stated that 50% of the girls and 28% of the boys had been exposed to CPA[13]. In US study more than one-half 54.1% of victims were female, 45.0% were men, and 0.9 percent were of unknown sex[14]. These results not correlated with the present study because of our culture that we are anxious more about female. Epidemiological studies suggest that CPA are more prevalent among children from low socioeconomic environments. 80% of this maltreatment is perpetrated by parents with poverty, in our study the association was significant in low to middle income families. Furthermore, mental health problems, low educational achievement, alcohol and drug misuse, having been maltreated oneself as a child, and family breakdown or violence between other family members are all important risk factors for parents abusing their children. These official cases are also generally skewed towards the lower end of the socioeconomic spectrum[2,3,5,6],

this is correlated with the current study according to the presence of stress at work, mother and father education and father job. Moreover, Researches have shown that abuse may impair the healthy development of the brain. Chronic abuse can have significant and broad consequences. Physical, mental, and emotional development may all suffer[12]. Sweden study showed that 70% of the children who reported self-injurious behaviors also reported history of some type of abuse[13] Physical abuse, emotional abuse, and neglect were also associated with an almost 3-fold increased risk of developing eating disorders and others was associated with a 5-fold increased risk of developing bulimia Nervosa. Physical abuse was associated with a doubling of the odds of childhood behavioral and conduct disorder with a significantly increased risk of suicidal behavior compared with non-abused individuals[14]. Other study indicated that abuse in childhood increased the likelihood of adult criminal behavior by 28% and violent crime by 30%[12,14].

The investigator recommend that traumatic event often trigger the development of CPA and its sequel may be eased by mediation of many factors such as: improve socioeconomic status of families to reduce stress.

Conclusion

This cross-sectional study aimed to determine the prevalence of CPA among sample of Mosul schoolchildren, using a self-reported questionnaire. A total of 800 intermediate school children,age group14-15 years represent more than one third, similar male to female ratio,more than one third of these had CPA and abused by mothers. Quarter of them had psychological problem. The relationship between the parent educations and father's job shows high significant rate.

Recommendation: The prevalence of physical in Mosul city is high and solutions should be sought to correct the problem engaging political and social leaders, the mass media, law enforcement agencies, parents and educators through research studies done to establish what works in this field.

Funding: This research was carried out at the researcher's own expense.

Ethical Considerations: The ethical letter was written in Arabic language as it is an official language for writing letters in the college of nursing Mosul-Iraq.

Conflict Interest: Nil

Abstract

As we know that healthy periodontium, is affected in most of the periodontal diseases. Which further leads to damage of hard and soft tissues. To attain back the lost structures the use of bone grafts have shown promising results. Managed either by mechanically recontouring it or by grafting techniques. Replacement grafts are widely accepted as bone formation by promoting for periodontal regeneration . There are many bone graft material which are used as bone substitute to fill the defect site the graft material acts like scaffold on which body react it by certain bone mechanism helps to regenerate new bone. This article give an overview on history, rationale and objectives of bone replacement grafts, Biology of bone healing, Indications for bone grafting include, Ideal requirements of bone grafts,List of bone graft according to origin.

Keywords: *Alloplast, bone allograft, bone autograft, periodontal regeneration, xenograft*

Introduction

Modern periodontics aims to maintain the healthy teeth and their supporting structures and the main goal is to control the infection and regenerate the lost supporting structures. Replacement of bone grafts are widely accepted as bone formation by promoting for periodontal regeneration . There are many bone graft material which are used as bone substitute to fill the defect site the graft material acts like scaffold on which body react it by certain bone mechanism helps to regenerate new bone. The basic principle of tissue regeneration is to stimulate a cascade of wound healing events. Hence, this review article focuses on the concept of bone graft discussing about various bone graft materials available and through light on the recent bone grafts.[1]

History of Bone Grafts: Historically, autogenous grafts were the first bone replacement grafts to be reported for periodontal application. Allogeneic freeze-dried bone allografts were first introduced to periodontics in the early 1970's, while Demineralized freeze-dried bone allografts gained wider application in the late 1980's with an even increasing market share in 1990's.[2] Way back bone grafts used for reconstructing intraosseous by Hegedus in 1923.[3] further revived in 1965 by Nabers and O'leary, they used shavings of cortical bone removed by hand chisels during osteoplasty and ostectomy and they were used to treat one, two-wall defect.[4] Allografts of iliac bone and marrow were used by Schallhorn et al. in 1970.[5] The era of hydroxyapatite (HA) in regenerative science dates back to 1950s when bioceramics were used as an inert scaffold for filling of the bone defects.[6] Yukna in 1990 did a clinical 6-month study on hard tissue replacement (HTR) polymer (HTR synthetic bone) and showed a significant defect fill and improved attachment level relative to open flap debridement (OFD).[7] Bio-Oss is a bovine bone from which all inorganic components are removed and used for regeneration by Richardson et al. in 1999.[8]

Rationale and Objectives of Bone Replacement Grafts: Periodontal therapy is directed not only at inflammation control but also at pocket reduction and correction of associated bone defects. When applicable,

regeneration of the lost bone and periodontal attachment improves the support of the tooth and hopefully its long-term prognosis. At the present time, bone replacement grafts are the only modality of therapy for which there is histologic evidence, in humans, of regeneration of new attachment composed of new bone, cementum and periodontal ligament coronal to the base of a previous osseous defect[9].

Clinical Objectives of Bone Grafting:

The objectives of bone grafting procedure in patients with periodontitis are as follows[10]:

1. Probing depth reduction
2. Clinical attachment gain
3. Bone fill of osseous defects and
4. Regeneration of new bone
5. Establish a healthy maintainable environment.

Numerous case reports and controlled clinical trials have provided clinical data on achieving histologic analysis, however, can accurately determine whether any true periodontal regeneration has developed because this is the onlymethod that reveals the type of wound healing that occurs next to the root surfaces after grafting is undertaken.[11]

Ideal characteristics of bone graft are as follows:

1. Nontoxic
2. Non-antigenic
3. Resistant to infection
4. No root resorption
5. Strong and resilient
6. Easily adaptable
7. Readily and sufficiently available
8. Minimal surgical procedure
9. Stimulates new attachment

Based on these scientifically acceptable criteria,New attachment apparatus has been observed after certain autogenous and allogeneic grafts.[12]

Biology of Bone Healing:

1. Actively forms new bone
2. Induces bone formation
3. Creates passive surface for bone formation
4. Provides mechanical obstruction

The transplantation of bone or biosynthetic materials to repair skeletal defects is now an accepted surgical technique Materials reported to have been used include cancellous, cortical, and corticocancellous bone, osteochondral plugs or synthetic material. Bone grafts provide osteogenic potential (primary osteogenesis or (osteoinduction) and scaffolding for in growth of new elements (osteoconduction).[13] Bone has the unique ability to heal completely and regain its original structure and mechanical properties; repaired tissue consists of new bone rather than scar tissue. The net biologic activity of the graft is the sum of its inherent biologic activity, its capacity to activate surrounding host tissues and its ability to support the in growth of host osteogenic tissue. During incorporation the graft site goes through several concurrent phases.[14] Bone graft success depends on the host recipient site, local growth factors of the host bed, bone graft viability, the volume of bone grafted and the structural function of the bone graft. Motion at the graft/host bone or soft tissue interface will impede or prevent revascularization.[15]

- The use of bone grafting or replacement materials is based on these materials may facilitate formation of alveolar bone, periodontal ligament and root cementum through one of the following mechanisms[16]:

1. Contain bone forming cells (osteoneogenesis).
2. Serve as scaffold for bone formation (osteoconduction).
3. Contain bone-inducing substances (osteoinduction).

Indications:

- Deep intraosseous defects of varying morphology
- Shallow intraosseous defects
- Furcations and shallow wide crater defect
- Ridge augmentation
- Combined procedure with GTR
- Peri-implant regenerative therapy.

Ideal Requirements of Bone Grafts

1. Should be immunologically acceptable
2. Should be resistant to infection
3. Should be biocompatible

4. Should be easily available
5. Should be cost effective

Bone Graft According to Origin:

Autogenous Grafts: Autogenous bone graft, which is harvested from the patient's own body, is considered ideal because of its osteoconductive and osteoinductive properties and because it contains a source of osteoprogenitor cells. It is still considered the gold standard among graft materials because they are superior at retaining cell viability. It combines all properties required in a bone graft material: osteoinduction (bone morphogenetic proteins (BMPs) and other growth factors), osteogenesis (osteoprogenitor cells) and osteoconduction (scaffold). Autogenous type of graft is harvested either from intraoral or extraoral donor sites. The intraoral sites include edentulous ridges, tori, maxillary tuberosity or healing bony wound or extraction sites as well as mandibular ramus and chin area The extraoral sites most commonly used are iliac crest and ribs.[17]

Allogaft Graft: An allograft, formerly called as homograft, is a tissue graft between individuals of same species but of non-identical genetic composition. Allografts are grafts transferred between genetically dissimilar members of the same species. Allografts are probably incorporated into existing bone by a process similar to that of autogenous bone grafts, but proceed more slowly as a result of the absence of living cells. In animalstudies, allografts have been found to possess bone-stimulating proteins and, consequently,osteoinductive properties.[18] Use of any substitute graft material and the possibility of transfer of disease from donor to recipient as well as the presence and significance of immune responses to foreign antigens. Thus, bone banks accredited by responsible organizations exist for the purpose of supplying the surgeon with safe and effective bone tissue that is suitable for intended clinical application. The goals of bone banking are to preserve the physical integrity of the graft and the inductive protein, to reduce its immunogenicity, and to ensure sterility.[19]

Freeze–Dried Bone Allograft (FDBA): Freeze drying removes approximately 95% of the water from bone by a process of sublimation in a vacuum. Although freeze drying kills all cells, the morphology, solubility, and chemical integrity of the original specimen are maintained relatively intact. Freeze Dried Bone Allograft (FDBA), but a number of synonyms exist (ground cortical, ground cancellous, freeze dried bone, etc.). Changes in particle size affects mainly handling characteristics, and many clinicians choose grafting materials on this basis.[20]

Demineralized Freeze–Dried Bone Allograft (DFDBA): Demineralized freeze-dried bone allograft (DFDBA) is nothing but freeze-dried bone allograft that is decalcified. The advantage is that, decalcification exposes the bone matrix proteins and hence induces osteogenesis. DFDBA is used because it contains bone morphogenetic protein (BMP), which induces new bone formation during the healing process.

Xenografts: Initially the term heterograft was used for these materials, but today they are termed as 'Xenografts' after the Greek word "xeno" which means foreign. Xenografts are surgical grafts transplanted between different species. Two sources of xenografts are commercially marketed as particulate bone replacement grafts in clinical practice bovine bone and natural coral. In order to render the animal bone non antigenic and safe for transplantation to human subjects, drastic chemical means were employed to remove the organic fraction of bone or markedly alter it. However this invariably produced an inert osseous product, which when placed in surgical defects has not been able to stimulate, even passively, new bone formation.[21] Recently, new processing and purification method have been utilized which make it possible to remove all organic components from a bovine bone source and leave a non- organic bone matrix in an unchanged inorganic form.

Anorganic Bone: Anorganic bone is a bone from which organic material is extracted by means of ethylenediamine and sterilized by autoclaving. The use of this material was encouraged because of the protracted sequestration of the graft particles and slow resorption.[22]

Anorganic Bovine-Derived Bone Xenograft (BDX): Anorganic bovine bone is the hydroxylapatite "skeleton" that retains the macroporous and microporous structure of cortical and cancellous bone remaining after chemical or low-heat extraction of the organic component. For example- A unique regenerative product is PepGen P-15®,a calcined bovine bone (1,100°C; hydroxyapatite) coated with a pentadecapeptide (P-15, a part of the sequence of collagen). In summary, bovine-derived hydroxypatite bone replacement grafts increase the available surface area that can act as an

osteoconductive scaffold due to their porosity and have a mineral content comparable to that of human bone, allowing them to integrate with host bone.[23]

Anorganic Porcine-Derived Bone Xenograft: A natural replicate of autologous bone, OsteoBiol Gen-Osconserves the same intimate structures (matrix and porous form)and presents a high osteoconductive activity.

Alloplast: Alloplastic materials are synthetic, inorganic, biocompatible, and/or bioactive bone graft substitutes, which are claimed to promote bone healing through osteoconduction. The available alloplastic materials are Plaster of Paris, polymers, calcium carbonate, and ceramics. Ceramics can be classified into resorbable (e.g., tricalcium phosphate and resorbable HA) and nonresorbable (dense HA, porous HA, and bioglass).

Calcium Phosphate Ceramics: Larger number of ceramics are available, the calcium phosphate type has been of particular interest because of the close chemical and crystal resemblance of some of these materials to bone mineral. Commonly used calcium phosphate ceramics for periodontal regeneration are essentially of two types: The relatively nonresorbable HA(Ca10(PO4) 6(OH) 2) or the resorbable tricalcium phosphates (Ca3 (PO4) 2).

Hydroxyapatite: The HA products used in periodontology are of two forms: A particulate nonresorbable ceramic form and a particulate resorbable nonceramic form. In controlled clinical studies, grafting of intrabony periodontal lesions with HA resulted in an attachment level gain of 1.1–3.3 mm which was greater as compared with nongrafted surgically debrided controls by Galgut et al. in 1992.[24]

Tricalcium Phosphate: Tricalcium phosphate has been shown to stimulate bone formation, and is comparable or in most cases superior in this regard to HA as described by Fetner et al. in 1994.[25] It has been shown to stimulate bone formation to a greater extent than HA, but to a much lesser extent than bioglass as described by Wilson and Low in 1992.[26] Cultured human fibroblasts have been demonstrated to attach readily to the surface of calcium phosphate ceramics. HA acts as an amphoteric ion exchanger. Selective accumulation of calcium and phosphate ion occurs as a consequence of the negative charges on the HA surface. This leads to the formation of more apatite and stimulates the formation of new bone.

Plaster of Paris: Plaster of Paris is biocompatible and porous, thereby allowing fluid exchange, which prevents flap necrosis. Plaster of Paris resorbs completely in 1 or 2 weeks. Its usefulness in human cases has not been proven.

Hard Tissue Replacement Polymer: HTR polymer is a nonresorbable, microporous biocompatible composite of poly-methylmethacrylate and polyhydroxyethylmethacrylate, a resorbable polylactic acid polymer. The polymer does not produce an inflammatory or immune response in contact with bone or soft tissue as described by Yukna in 1990.[27]

Bio-Active Glasses and Ceramics: Bioglasses are composed of Si-CaO-Na2 O-P2 O5 and are resorbable or not resorbable depending on the relative proportion of these components. When bioglasses are exposed to tissue fluids, a double layer of silica gel and calcium phosphate is formed on their surface. They have been extensively used in conjunction with medical and dental implants because they develop a layer of hydroxy-carbonate-apatite on their surface following exposure to body fluids. When used on the surface of metal implants, this layer incorporates collagen fibrils and in this way produces a mechanically strong bond between implant and the adjacent bone surface as described by Hench and West in 1996.[28]

New Innovations Pepgen P-15: It is a bone grafting material used to fill periodontal osseous defects that is composed of anorganic bovine-derived HA bone matrix combined with a synthetic cell-binding peptide.

Growth factor-enhanced matrix 21S Growth factor-enhanced matrix (GEM) 21S is a synthetic grafting system for bone and periodontal regeneration composed of a purified recombinant growth factor and a synthetic calcium phosphate matrix.

Conclusion

The use of bone graft in the field of dentistry world-wide has shown great acceptance by the patient. Though the current technologies can be considered as mature, many developments and improvements are made to mimic the biological properties of a human closely. Different kind of materials with different property has been used from way back and till date to treat different type of defects.

Abstract

Suicide is an important mental health problem in our society, as it is in most of the world's developed nations. It's an affliction that robs us of some of our community's most active leaders. It is a most troubling type of mental disease to imagine, a mental disorder in which the victim's pain and fear causes him to prefer death to his misery. Suicide is widespread. Most communities have earlier treated suicide as a felony and have instituted laws to restrict the act and prosecute those who attempt it whereas the notion have changed and now individuals who try or commit suicide are frequently viewed as depressed or mentally unstable. This Covid(Corona virus) pandemic had made the situation worse because many people are taking help from professionals for the first time due to severe increase of anxiety and stress. During this lockdown period many have developed suicidal tendencies and seeking physicians' help. After the suicide of famous bollywood actor Sushant Singh Rajput many are talking about the mental health awareness. In this present paper we will analyze the problem of suicide, mental health care laws and suicide regulation and some strategies for suicide prevention.

Keywords: *Suicide, Mental Health, Suicide prevention.*

Introduction

"There are many pointless deaths but never a needless suicide. Every suicidal act is addressed to certain unfulfilled needs" –Shneidman Edwin

Man is brought into the world free but wherever he is in chains.Suicide has been perceived as a noteworthy general medical issue. WHO recognizes that suicide is a worldwide issue influencing all countries. Suicide adversely affects the individuals who murder themselves as well as on families, networks and on society. WHO perceives that numerous deaths from suicide are incautious and require successful, exhaustive, multi pectoral reactions and national systems for avoidance.[1]

According to the recent report published in "*Crime in India 2018 Statistics* (National Crime Records Bureau, Ministry of Home Affairs) under the Chapter II (Suicide in India) recorded a total of 1,34,516 suicides were reported in the country during 2018 showing an increase of 3.6% in comparison to 2017 and the rate of suicides has increased by 0.3 during 2018 over 2017."[2] Each suicide is a personal tragedy that prematurely takes the life of an individual and has a continuing ripple effect, dramatically affecting the lives of families, friends and communities. Every year, more than 1,00,000 people commit suicide in our country. There are various causes of suicides like professional/career problems, sense of isolation, abuse, violence, family problems, mental disorders, addiction to alcohol, financial loss, chronic pain etc. NCRB collects data on suicides from police recorded suicide cases. From this it is clear that police recorded cases does not include the unreported cases and in India many suicide cases are not reported and mainly the attempted cases are reported minimal because attempt to commit suicide is still considered an offence. According to the WHO, around 8 lakhs people die of suicide every year and up to 25 times as many make a

suicide attempt. And in 2018, National Crime Records Bureau provides that the average rate of suicide in India is 10.2.

Since the laws of mental health treatment have focused on mental illness/psychiatric rhetoric to describe suicide, it would be misleading to argue that suicide is medicalized in India with the passing of this Legislation. Efforts to discourage suicide in general mental health provide a more complicated definition of suicide prevention than the rules of mental health. While the national mental health policy approach to suicide prevention has been to conceptualize suicide as predominantly a health concern, it nevertheless deals with non-health, non-medical activities such as restricting pesticide exposure, or promoting 'high-risk' urban space monitoring as approaches for suicide prevention.[3] Transnational and national public policy programs in seeking such a strategy should not view suicide solely through the prism of mental disease. As public health programs also adopt a psychosocial approach which takes into account social, cultural and economic issues when developing interventions. Including suicide as a public health issue, prevention of suicide needed to be viewed not only as a human mental disorder but by certain systemic forms of prevention. Psychiatric policy and medicinal practice is a traditional capitalist system of control capable of ruling through the wellbeing of the communities.[4] The claim that in contemporary India such a change to the suicidal person's medical services is illustrative of attempts to manage the suicidal person by therapy may be made. Yet, as we have learned, the current dialogue on suicide and mental illness is just part of the picture.

Objective: The present article attempts to analyse the importance of the problem of suicide and the role of mental health in understanding and preventing suicide.

The Problem of Suicide: The importance of the problem can be measured in numbers, in value of the lives lost and in the suffering of the suicide victim and those who knew about him. Suicide is indeed a complex issue encompassing philosophical, ethical, legal and practical dilemmas. It needs open debate with due consideration to different aspects and points of view. Lack of precise measures to detect mental illness is not a sufficient reason to assume all suicides are due to abnormal mental states. It must be a drive towards developing measures that enable us to detect and exclude mental illnesses with more confidence and certainty. The subject of suicide is painful and often an avoided area for consideration or discussion. Many feel it is a morbid issue and that talking about it may only stir up interest and perhaps increase the incidence. Attitudes towards studying, understanding and preventing suicide vary but there is an increasing concern about the problem and willingness to face it.[5]

In India, suicides are more of a medico-legal problem than a health or societal problem. Hence information on suicides is collected and compiled by police departments. In developing countries like India, a number of factors related to culture, family life, education, growing aspirations and inability to tolerate negative feelings contribute in a big way for suicides. Various research studies state that biological, genetic, and psychosocial risk factors for suicide may in many cases not confer risk directly, but indirectly, through lack of social support, stressful life events, depression, hopelessness and suicidal intention which ultimately increases risk for suicidal behaviour. The most promised risk factors are a prior suicide attempt and mental illness. Research indicated that 90 – 95% of people who die by suicide had at least one diagnostic mental disorder, particularly including depression, bipolar disorder, borderline personality disorder, and substance dependence or abuse.[6]

Mental Health Care Laws and Suicide Regulation: Prevention of suicide within mental health care discussion is not a special thing in itself. As demonstrated, suicide avoidance and public health discourse encompasses psychiatric/biomedical, psychological, and psychosocial interventions. But, unlike the discourses that went into criminal law debates, where there were no limits on what conversation could affect a legal judgment, there are clear limitations in mental health care discussions. Initiatives for mental health care, not only psychiatric/ pharmacological but also psychosocial programs, regularly concentrate clinical dialogue and specialists in their suicide prevention mandate. Discourse on mental health treatment has driven changes in suicide laws. Law reform attempts have been made to decriminalize attempted suicide, and portray all suicides as a question of mental health.[7]

Post-independence, there were two significant laws in India which had an effect on mental health treatment. The Mental Health Act -1987 (MHA) has given a legal protection for mentally ill people and the Persons with Disabilities (Equal Opportunities, Protection of Rights

and Full Participation) Act - 1995 (PWD) provided a basic standard of care for those with intellectual disorders, including mental illness with a disability classification. All of these legal provisions, however, faced criticism from mental health care providers, human rights activists, and disability scholars.

Mental Health Care Bill-2013 and 2016: The Mental Health Care Bill (MHC)-2013 is an attempt to reform Indian mental health carelaws.

"With regard to the legal regulation of suicide, Section 124 of the MHC Bill-2013 states:

1. Notwithstanding anything contained in Section 309 of the IPC, any person who attempts suicide shall be presumed, unless proved otherwise, to be *suffering from 'mentalillness' at the time of the bid and shall not be liable to punishment under the said sections*.
2. The appropriate Government shall have a duty to provide care, treatment and rehabilitation to a person, having mental illness and who attempted to commit suicide, to reduce the risk of recurrence of attempt to commit suicide".

The bill does not amend Section 309 IPC in saying this but presumes that committing suicide is a symptom of mental illness. Under this Section 124 term, a person contemplating suicide would be spared from criminal prosecution but considered to be "mental disorder suffering."

The 2013 MHC Bill was praised by numerous medical clinicians for portraying suicide as a mental disorder.

Firstly, they argued that this new conceptualization would benefit those people who attempt suicide because of stress; secondly, by not involving the police and instead putting them under the protection of mental health practitioners, the new bill was seen as more responsive to the needs of individuals who attempt suicide and thirdly, under the newmedical framing of suicide, families where someone has attempted suicide would be more willing to report the incident since they no longer have to report to the police.[8]

"With regards to the implications of Section 309 IPC, Salelkar and Davar explain that, asper MHC Bill 2013, a person who attempts suicide is exempt from punishment but notprosecution. Thus, the police continue to have the authority to remand a person who has attempted suicide into custody and produce them in front of the Magistrate. Since the law would assume that such a person is suffering from mental illness, s/he could be sent to a public mental establishment for assessment and treatment, or mandated to remain in a mental health establishment for up to ten days (Salelkar & Davar, 2013; Section 111, MHC Bill 2016)."[9]

The Mental Health Care Act, 2017: In India, the Mental Healthcare Act (MHCA) 2017 was passed on April 7, 2017 and enforced on May 29, 2018. This is "an Act to provide for mental healthcare and services for persons with mental illness (who have substantial disorder and whose functioning is grossly impaired) and to protect, promote and fulfil the rights of such mentally ill persons (who have substantial disorder and grossly impaired functioning), during delivery of mental healthcare services and for matters connected therewith or incidental thereto."

Until now, an attempt to commit suicide was a criminal offence as per Section 309 of Indian Penal Code (IPC), 1860. It is worth remembering here that the words "mental illness," which was used in a previous draft of the MHCA in 2013, was replaced by "severe stress," in 2016, by the Indian Parliament in MHCA 2017 after a lot of deliberations after considering the stigma and abetment laws associated with attempted suicide.

Section 115 of The Mental Health Care Act, 2017 specifically provides **Presumption of severe stress in case of attempt to commit suicide-**

"Notwithstanding anything contained in Section 309 of the Indian Penal Code any person who attempts to commit suicide shall be presumed, unless proved otherwise, to have severe stress and shall not be tried and punished under the said Code. The appropriate Government shall have a duty to provide care, treatment and rehabilitation to a person, having severe stress and who attempted to commit suicide, to reduce the risk of recurrence of attempt to commit suicide."

This provision impliedly repealed Section 309, the Indian Penal Code of 1860 which penalises attempted suicide. It is submitted that the legislators have realized, though belatedly, that suicidal tendency is an aspect of mental illness, and that such a person needs treatment in mental asylum rather than prison sentence.

There is no single change from one mode of control to another in the story of suicide regulation in India.

Many life-management strategies exist in tandem. In India there coexists religion, legal (criminal and mental health laws), disability, political, cultural, caste violence among other suicide discourses. Therefore, the basis for suicide legislation does not lie exclusively within the rules of criminal justice, mental health care regulations or the debate of general mental health. However, though many discourses are at stake in debates on suicide, the debate on mental health is expanding rapidly. The campaign for mental health (from the global north as well as inside India) has described suicide as a result of mental illness, which should not then be criminalised.[10]

Suicide Prevention: With the evolving times, the issue of suicide was seen progressively like a worldwide issue and the World Health Organization has concerning attempted suicide empowers attempts for the prevention of suicide and communicated the view that rebuffing with detainment a conduct subsequent to either a psychological issue or a social trouble gives totally an off-base message to the populace. The International Association for Suicide Prevention has likewise communicated the view that attempted suicide ought to be decriminalized and that self-destructive people should be aided and detainment just aggravates their issues.[11] And in pursuit of their objective, the Association made September 10 as 'World Suicide Prevention Day."

Preventive programs should therefore be planned with a view to reducing factors which increase the probability of suicide attempts and which factors aimed at fostering resilience. Certain steps can be taken[12]-

i. Effective diagnosis of psychiatric illnesses and successful treatment are highly significant.
ii. Improved 24 x7 Suicidehelp-lines will help people deal with difficult circumstances that cause severe distress.
iii. Services for care and prevention should be adapted to the needs of specific age groups.
iv. Spreading information among people about risk factors, warning signs and recovery and preventive approaches is imperative.
v. Restricting exposure to common suicide strategies and preventing the use of extremely lethal method are without doubt necessary.
vi. Educational and religious institutions will play a crucial role in the effective and efficient delivery of preventive programmes.
vii. To promote fair media reporting, much focus should be put on the idea that suicide is a pointless way to solve problems.
viii. High-risk people should be aimed at preventive programmes.

Individuals have no influence over the ups and downs of life, but keeping a good outlook will certainly improve the willingness to take them in action even in the face of adverse circumstances. There's nothing more valuable than life and suicide will never fix the problem.

Conclusion

Mental illnesses are considered to be closely linked to suicide. Diagnosed mental illnesses, particularly depression, are very common in persons attempting suicide. Similarly, drug dependence is closely related to suicide. Given ample clinical research associating treatable mental illness with suicide, the country's access to medical services remains weak and this confuses the issue. The new Indian Mental Healthcare Act passed by the parliament suggested that attempt to commit suicide has been impliedly decriminalised. It has made the government duty bound to provide medication, diagnosis and recovery to a person who has attempted suicide because of extreme stresses. This is a welcome step and might strengthen the suicide prevention strategies which are almost nonexistent due to poor resources both in terms of trained workforce and budgetary allocations. Whereas even after the brave attempt by the Mental Health Care Act to partially decriminalize suicide in 2017, the sad statement on the nation is that decriminalization can only become absolute if Section 309 is complete deleted from Indian Penal Code, 1860. What's needed is what Britain did in Suicide Act, 1961, the complete decriminalization of attempted suicide. Every police man today knows if you fail suicide attempt he will take you into custody under Section 309, IPC, but nobody in the police knows that there is a clause in the Mental Health Care Act 2017 that actually decriminalizes attempted suicide. Therefore, awareness of the Mental Health Care Act is the need of the hour. And there should be set up of a National Suicide Prevention Council with experts from a wide cross-section of society without much loss of further time. It is time the nation adopt a Zero Suicide India Plan.

Ethical Clearance: Not required, as the article is based on aspects which are doctrinally taken.

Awareness of Adverse Effects of Lead-containing Cosmetics among the Adolescence and Young Adult Population in Chennai: A Survey

Sneha A.[1], Balaji K.[2], Yuvaraj Maria Francis[3], Gunapriya Raghunath[4]

[1]Undergraduate Students, Saveetha Medical College and Hospital, Thandalam, Chennai, India, [2]Tutor, Department of Anatomy, Saveetha Medical College and Hospital, Thandalam, Chennai, India, [3]Assistant Professor, Department of Anatomy, Saveetha Medical College and Hospital, Thandalam, Chennai, India, [4]Professor & Head, Department of Anatomy, Saveetha Medical College and Hospital, Thandalam, Chennai, India

Abstract

Background: Lead and it's compound induced health problems are continue to be an important, preventable public health issue. The common source of lead exposure in modern days is cosmetic products.

Aim and Objectives: The study aims to evaluate the awareness about the adverse effects of lead-containing cosmetics in adolescence and the young adult population including factors influencing customers, knowledge about the product ingredients, and quality.

Materials and Method: In this study, a questionnaire was prepared using Google form and circulated among the adolescence and young adult subjects to assess the awareness about the adverse effect of lead in cosmetics. The study sample comprised of totally 203 participants of both males and females with the age group between 16 to 24 years.

Results: In this study, it is found that 87% of the participants were aware that cosmetic products harm their health. 78% of the participants know lead and its compounds present in the cosmetics. 86% of participants have the habit of checking the ingredients and quality of cosmetic products. About 96% of the participants were influenced by the advertisement of the product before buying it.

Keywords: *Awareness, Adolescence, Cosmetics, Lead, and Participants.*

Introduction

Adverse effects of heavy metals are a major public health concern, particularly lead and its compounds may cause negative impacts on human health. Metals such as lead, mercury, and cadmium in cosmetics are described as listed among the ten major chemicals of concern by the World Health Organization (WHO).[1] These metals are purposefully added to cosmetics, existas impurities in cosmetics, or unknowingly added from manufacturing devices itself. Lead and its compounds occur naturally in the environment. However, most of the lead added throughout the environment by human activities such as car battery, ammunition and as a constituent of solder, alloys, and pewter. The lead in the environment had increased 1,000-fold in the past few centuries especially during the industrial revolution.[2] The lead has widespread industrial use, such as application in gasoline,fuel and solid waste combustion,paints, and most importantly in cosmetics. Lead compounds

such as lead dioxide, lead chromate, leadhydroxyl carbonate, and lead sulfide are used in colourcosmetics as pigments.[3] The risk of exposure to lead is high among children due to their hand to mouth activities which may cause cognitive and neurobehavioral deficits.[4] The lead toxicities may result in organ damage specifically bone, kidney and liver injuries, intellectual impairment, and other symptoms, such as irritability, headaches, and confusion.[5] The Food and Drug Administration (FDA) in the United Statesstated that 20 PPM is the maximum limit for lead in edible products. Nevertheless, leadis cumulative, and using lead-contaminated cosmetics regularly, canadd up to significant exposure levels and adversely affect humans. A significant amount of the lead body burden is confined tothe bone with a half-life of more than 20 years (WHO, 1995).[6] Blood lead level is increased during increased bone turnover especially during pregnancy, lactation, and menopause in women's live.[7,8] Although several measures to control the lead exposure are already implemented by both government agencies and non-governmental organizations in many countries such as the use of unleaded gasoline, unleaded paint, ceramics used for storage and preparation of food and lead-free cosmetics. Lead contamination is still a major public health problem in underdeveloped and developing countries and targeted high-risk populations. Lead compounds and several other substances are prohibited ingredients in cosmetics in many countries.[9] Therefore, the aim of the study is to understand the level of awareness and knowledge about lead-containing cosmetics and its adverse effects among its users.

Methodology

This cross sectional study was conducted in Saveetha Medical College during the period from November 2019 to April 2020. This cross-sectional study was to assess the awareness about the composition of cosmetics particularly about the potentially harmful substances such as lead. A survey method was adopted as a means of data collection because it provided the best possible way to assess the awareness of participants regarding the use of cosmetics. This study was conducted by using Google form to observe the cosmetic usage practices of participants through the medium of analyzing questionnaires. The survey was arranged in three sections in which the first section consisted of questions regarding the age and usage of makeup. The second section consisted of questions regarding the usage pattern of different personal care products. The third section of questions included questions regarding the awareness and shopping patterns of the consumers. The data was collected from a sample size of 203 participants including both the gender within the age group of 16 to 24 years with proper informed consent. The data collected were compiled and analyzed using Microsoft excel 2010.

Results

The mean age group of the study participants was 19.1 years with a standard deviation of 1.347. The majority of the participants were females 157 (77%) and males were 46 (23%).

The majority of the participants were aware of the fact that cosmetic products have harmful compounds (87%) (Fig: 1).

The eye-opener finding was that 78% of the participants have knowledge about the adverse effects of lead and its compounds present in the cosmetics (Fig: 2).

About 6% of participants did not state the frequency of cosmetic use. Of the remainder 67% reported having used cosmetics rarely, 21% used cosmetics frequently, and 6% very frequently in their life. Figure: 3 shows the frequency of the use of cosmetics by the participants. Respondents were asked if they had ever used cosmetics for the whole day, and if so how many cosmetics they used simultaneously. This question was not answered by the majority of the participants, and 56% stated that they had never been daily users. Above 27% of the participants who had been daily users at some time, the mean number of cosmetics used per day was 4 (range l- 7).

The majority of participants 86% check the ingredients and quality of the cosmetic products, meanwhile,11% and 3% of the participants just see the price and package respectively without seeing the quality and ingredients of the products (Fig: 4). And about 96% of the participants were influenced by the advertisement of the product before buying it.

Discussion

The important reason for carrying out this cross-sectional study is to understand the awareness and knowledge about the adverse effects of lead-containing cosmetics. The purpose for selecting lead and its compound content in cosmetics for this study was to add weight age to the recent reports about the presence of lead in cosmetic products such as lipsticks and hair

dyes and also since the potential exposure to lead may be harmful even with ordinary use. Moreover, lead proven to cause serious health problems, including poisoning,and pathological change in vital organs.[10, 11] The study done by Sharafi K et al stated that lead content in six tested lipstick samples was evaluated; the highest and lowest lead content was 455 mg/kg and 208 mg/kg respectively. This difference of lead content may be attributed to the difference in the quality of the raw materials used in the lipsticks.[12]

This survey has questions that are basics one to tests the awareness of the participants about the lead-containing cosmetics including questions such as usage, knowledge of quality and ingredients, awareness about adverse health effects, and preventive measures. Similarly, study was conducted by Shiraz A, and Rahaman A reported that 88.33% of respondents used cosmetic products only once a day. 77.33% of respondents spent more than Rs.1000 per year on their expenditure on cosmetics, and the same percentage of respondents were found using multiple cosmetic items in a day.[13] In 2016, study done among medical students from Kerala stated that 83.75% males and 98.3% females use cosmetics, Among them, 80% preferred natural cosmetics and respondents were influenced by beauty experts (6.7%); by advertisement(12%); dermatologists (33.56%) and by the peer group (33.56%).[14]

A predominant number of women (84.2%) in Bolgatanga, Ghana were not aware of the adverse effects of cosmetic bleaching products. However, 60.8% do not bleach their skin and 39.2% used cosmetic bleaching products.[15]

The continuous use of cosmetic products contaminated with lead among the young population who already have adequate knowledge about the adverse effects of cosmetics is a major concern where extensive use of lead-containing cosmetics should be avoided until it is adequately addressed. Therefore, efforts must be made to inform the users and the general public especially the young population, pregnant and lactating women and children about the harmful consequences of cosmetic use.

In comparison with lead content from sources such as food, water, and air, continuous exposure to lead from cosmetics has been considered as a negligible source. Despite that, consistent and cumulative exposure of lead in the body for a long time, cosmetics can be considered as a substantial source of the lead.[16,17] Therefore, to cancel the adverse health effects of lead, cosmetics producers must use natural ingredients specifically colour additives that are lead-free.

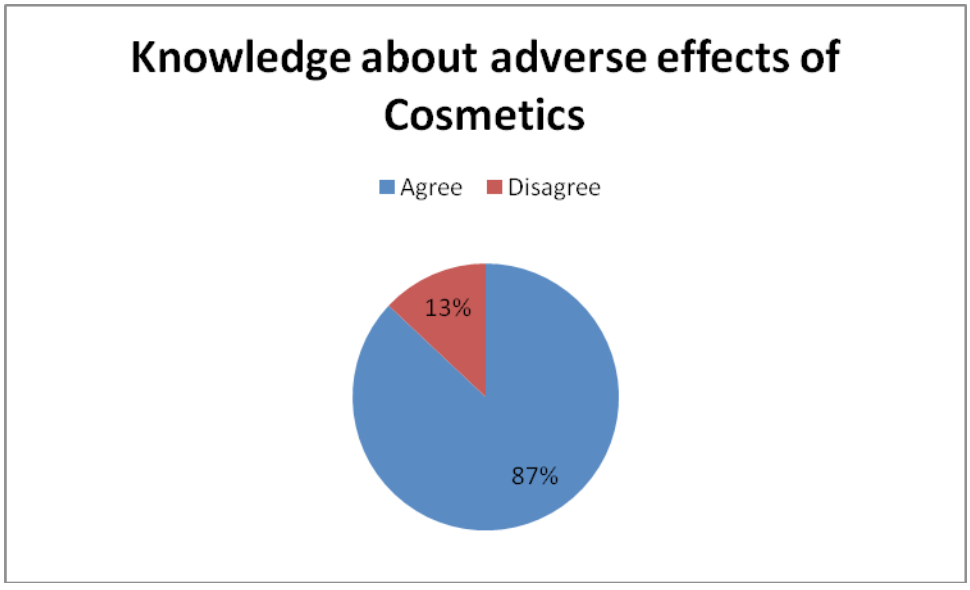

Figure 1: Showing knowledge about the adverse effects of Cosmetics

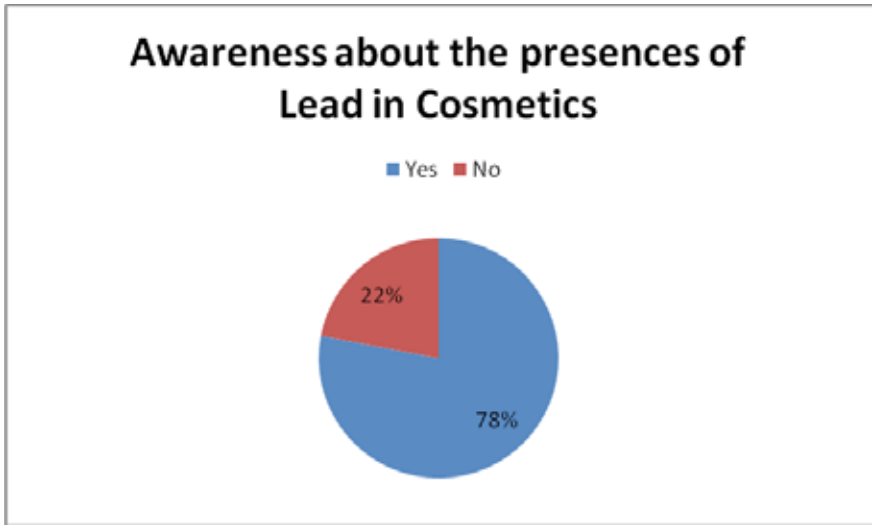

Figure 2: Showing knowledge presence of lead and its compounds in the cosmetics

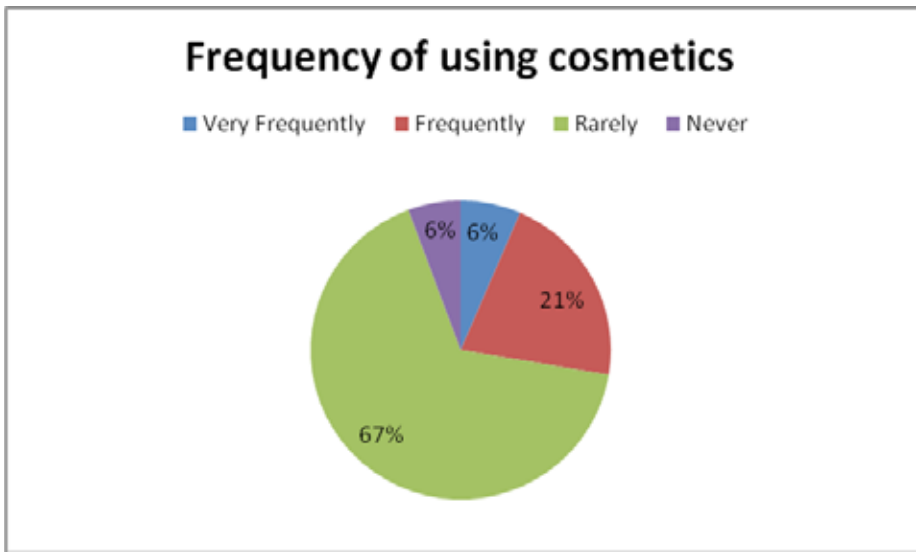

Figure 3: Showing the frequency of cosmetic use among the participants

Figure 4: Showing the factors influencing the cosmetic purchasing decision

Conclusion

The data revealed useful information about knowledge of lead content in cosmetic products among the adolescences from Chennai. Overall, the study provided a basic understanding of the participant's attitude towards cosmetic products. Public health interventions should focus on prevention to ensure that lead contenting cosmetics are not available for sale in the market or through e-commerce. The elimination of lead-containing cosmetics from stores, checking the ingredients to determine its lead level, and conducting the routinetest for the safety products are the other preventive measures. Health professionals can play a major role in raising awareness through education to reduce risk.

Medical and Legal Constraints for Organizing 2020 Regional Head Election in the Covid-19 Pandemic in Indonesia

Sri Wahyu Ananingsih[1], Ratna Dewi Pettalolo[2]

[1]Lecturer at Universitas Diponegoro, [2]Lecturer at Universitas Tadulako

Abstract

In 2020, Indonesia will hold regional head elections simultaneously in 270 regions covering 9 provinces, 224 districts and 37 cities, voting on 9 December 2020. This study aims to analyse the potential for general elections in the midst of Covid-19 pandemic in Indonesia..Descriptive qualitative research method are used in which the data is obtained through interactive discussions, interviews and document searches. The results of our analysis conclude that there are 4 potential vulnerabilities in the 2020 elections, namely the availability of the budget, the readiness of election organizers, the number of alleged violations and the level of community participation. Recommendations for this study are the efforts to collaborate, coordinate and communicate well between the government and the election organizer and increase public participation.

Keywords: *Covid-19, Election, Indonesia, medical and legal measures.*

Introduction

Covid-19 pandemic is now sweeping the world. This virus initially known in Wuhan, China. After that spread very quickly to various countries in the world, including Indonesia. The World Health Organization (WHO) establishes the Covid-19 as a world pandemic. As a result of this pandemic, Indonesia delayed regional head elections which were originally held on September 23, 2020 to December 9, 2020. Given that the pandemic has not ended yet, in the implementation of the elections a health protocol policy was implemented to break the chain of the spread of the covid-19 virus. These policies include the use of masks, hand sanitizer, the application of physical distancing, social distancing and the use of personal protective equipment.

Local elections that will be held in Indonesia are direct local elections. Inevitably the direct local election is an extension of the political participation of the people in order to determine the figure of the regional head. Direct elections are also a form of people's sovereignty in order to be elected regional heads who have strong political legitimacy[1]. It is said to have strong legitimacy because candidates are elected directly by the constituents in their area. So thus the elected regional head is expected to be oriented to the welfare of the people in his area[2]. The decision of the Indonesian government to carry out the elections on December 9, 2020 is final, while the covid-19 pandemic is estimated not to end until the end of 2020. Given these conditions for the first time experienced by Indonesia, it is interesting to study the potential for vulnerability that occurred in the 2020 elections. With known potential vulnerability, prevention efforts can be made so that no alleged violations occur.

Method

This study was designed as a descriptive qualitative research focusing on examining the potential for 2020 elections in the midst of the Covid-19 pandemic in Indonesia. Qualitative approach is an approach that provides an opportunity for researchers to describe and interpret research results in order to obtain a comprehensive understanding[3]. This research was conducted in Indonesia where as many as 270 regions consisting of 9 provinces, 224 districts, and 37 cities

will carry out the elections on December 9, 2020. All qualitative data includes primary data and secondary data. Primary data obtained through interviews and interactive discussions. While other data in the form of secondary data obtained from literature studies, in the form of references from journals as well as research results and legislation related to regional head elections. All data were analyzed using descriptive method.

Implementation of the 2020 Elections in Pandemic Covid-19: Indonesia is not the only country to hold elections in the midst of the 19th pandemic. There are about 15 countries in the world that will also hold elections in the period June to November 2020. These countries include Mongolia, Iceland, Tanzania, Jordan, Australia, Malaysia and the United States (MDN News Magazines, Impact on elections International IDEA Stockholm, MDN News Magazine Special Edition 01/ VI/2020)[4]. In Indonesia itself, it will simultaneously hold regional head elections (elections in 270 regions covering 9 provinces, 224 districts and 37 cities).Based on the graphic info data above, the 5 provinces that hold the most regional elections are North Sumatra Province (23 Regencies/Cities), Central Java Province (21 Regencies/Cities), East Java Province (19 Regencies/ Cities), West Sumatra Province (14 Regency/City) and South Sulawesi Province (12 Regency/City).

The decision of the Indonesian government to hold elections in 2020 one of them is due to the consideration that around 200 incumbent regional heads participating in the 2020 elections (from 270 regions) will end their term of office on February 17, 2021. So if the regional head election is delayed until the year 2021, it is feared that it will disrupt the running of the regional government, especially in the 200 regions. Therefore, in 2021, the position of regional head has ended and was replaced by an tasks executor official. The official has limited authority and does not cover the authority to decide on strategic matters, aka the government decides on the implementation of the elections in 2020 despite the Covid-19 pandemic.

Considering that Indonesia has only once held a regional election in the midst of a Covid-19 pandemic, it is interesting to study the potential vulnerability that might occur in the 2020 elections. The first potential for vulnerability is the issue of budget availability. The budget for this year's elections is needed by organizers not only to finance the elections but also to meet the needs of procurement of medical devices. The problem was that medical equipment had not been budgeted by the election organizers at that time because at the time of budgeting there was no Covid-19. An additional budget is needed for that. The fact is that most regions are no longer able to provide additional funding for the procurement of medical devices. This is due to the local government's budget allocation has been focused on financing the Covid-19 pandemic countermeasures. To overcome these conditions, efforts were made to partially provide the budget by the central government through the Indonesian State Budget and partly through restructuring the existing organizers' budgets, and some budgets have been returned to the government to support efforts to overcome the Covid-19 pandemic. As for the needs of medical devices such as masks, hand sanitizers, and soaps, specifically for areas that are prone to covid-19, face fields and personal protective equipment (PPE) are also needed.

The budget is also needed by the General Election Commission (KPU) for the costs of organizing regional head elections. An urgent budget beyond what already exists is a budget for the cost of adding to the number of polling stations. This is because the KPU reduced the capacity of the number of voters in each polling station so that the polling stations grew. Per polling stations, from a capacity of 800 people reduced to 500 people, reduction in the capacity of voters per stationsin order to prevent the spread of covid-19. Due to the addition of polling stations, the number of polling station officers and supervisors has increased. In addition to the KPU, the Election Supervisory Body (Bawaslu) also requires a budget for the costs of adding supervisors.

Another budget needed by the organizer is the cost of strengthening the internet network to support smoothness at each stage of the regional head election. KPU Regulation No.5 of 2020 states that some stages can be carried out using internet information technology, although it is recognized that not all regions have easy access to the internet network, such as islands or mountainous regions such as Papua and Maluku. If it is not reached by the internet, the regional head election process must be carried out as in the regional head election in normal conditions with strict health protocols to prevent covid-19.

The readiness of the regional head election is the potential for a second vulnerability. The election of regional heads in the midst of the Covid-19 disaster is a new thing that has never happened before, even though

the organizer in carrying out its main tasks functions is required to hold on to 5 principles namely: independent, impartial, transparency, professional and sustainability (United Nation Development Program, Principles for Independent and Sustainable Electoral Management, International Standard for Electoral Management Bodies, Cairo, Egyp, 9-11 April 2012)[5]. Organizers are also said to be election law enforcement officers, so in the context of building an electoral law enforcement system, the effectiveness of the performance of election administrators as election law enforcement officers has an important role[6].

In Covid-19 conditions, the organizer's readiness includes readiness to always maintain the health of oneself and the community. The health protocol from the government must be applied strictly. Apart from that, the provision of knowledge for the implementation of the performance of the organizers plays an important role. In this election the provision of knowledge can be done virtually through online media. Many online service provider applications can now be used such as Whats App, Zoom Meeting, Facetime, Microsoft Team and so on. This effort was made to save the budget and also to prevent the spread of covid-19.

Other organizers' readiness is in the form of providing regulations that are adjusted to the conditions of the Covid-19 pandemic. According to the International Institute for Democracy and Electoral Assistance (IDEA), free and fair elections require the availability of legal instruments governing each stage of the election[7,8]. In accordance with the covid-19 protocol, regulations must regulate restrictions on activities that are mass gathering/supporters. Instead, alternative method are given such as activities through online media/internet. For example, at the stage of updating voter data that began on July 6, 2020, the process of matching voter data, recapitulation and announcement of the voter list which in the previous election was carried out by face to face/physical meeting then in the 2020 elections can be done using online/online media.

Likewise, at the campaign stage carried out on September 26 to December 5, 2020. Participants in the regional head election can carry out campaign forms such as limited meetings, face-to-face/dialogue meetings, public debates, installation of campaign props, media advertisements and forms others that do not violate laws and regulations. The KPU also provides time for regional head election participants to carry out campaigns through mass, print and electronic media from November 22 to December 5, 2020. The form of face-to-face meetings, dialogues and limited meetings has special arrangements such as place, number of campaign participants, campaign time, and compliance with government health protocol requirements.

At the stage of voting and counting, it is necessary to arrange for a representative polling place. In the provisions of Article 87 of Law No.10/2016, each polling station has a maximum voter capacity of 800 people, but because of Covid-19, the KPU rearranges the capacity of 500 voters in each polling station his. Likewise, it is also related to the facilities that need to be provided in polling stations including the provision of hand washing facilities, soap, hand sanitizers, and masks. The queuing system for voters who will use their voting rights must also be set at least 1 meter apart. In areas prone to Covid-19, organizers must be equipped with personal protective equipment in accordance with government protocol. In the recapitulation stage of vote counting, it can be done by the online media method.

With regard to the supervision of each stage of the election, it is the authority of the Bawaslu. In conducting surveillance, Bawaslu must apply health protocol standards from the government. Bawaslu's steps in preparation for the supervision of regional head elections 2020 based on Bawaslu Circular No.0298/K.Bawaslu/PM.00.00/5/2020 is to prepare for the supervision of the stages of regional head election (Election) to identify the obstacles in the implementation of elections and ensuring health protocols for election observers when conducting surveillance. Furthermore, the Bawaslu issued Bawaslu Circular Letter No.0351/K.Bawaslu/PM.00.00/6/2020 concerning the implementation of election supervision during the covid-19 pandemic. Regarding the handling of violations, Bawaslu must have a specific strategy in processing every alleged violation whether it is an administrative violation, a code of ethics or a criminal election as well as in exercising the authority to handle disputes over the election process.

The third potential vulnerability is the number of alleged violations that occurred during the regional head election. This potential vulnerability is likely to arise due to conditions affected covid-19, for example the stages that are usually carried out in physical meetings or face to face now turn to virtual. This can result in the stages not running optimally, the level of compliance of the organizers with the covid-19 protocol

and alleged violations committed by participants in the elections. Alleged violations that are expected to occur include alleged abuse of authority, vote buying, black campaigns, campaign violations on social media and also the neutrality of the civil servants. Furthermore, allegations of campaign violations on social media are expected to increase compared to the 2019 elections. This estimate arises because of restrictions on campaign activities that are mass gathering or physical gatherings. These restrictions are carried out in accordance with the recommendations of the Covid-19 health protocol from the government. Instead, campaign activities can be carried out using internet media/online. This will later encourage increased use of social media in the 2020 elections. Moreover, the cost of using social media campaigns is cheaper than campaigns using mass media[9].

Regarding the alleged violation of the neutrality of the civil servants, this alleged violation has been rife since the start of the 2020 elections until now. This violation is prone to occur in areas where the incumbent regional head is running again. With his power, the incumbent head easily mobilized civil servants to support his candidacy. Meanwhile, Law No. 5 of 2014 concerning civil servants and also Gov. Reg No.42/2004 explicitly explained that civil servants must be neutral, impartial and impartial, but in practice many civil servants committed violations. Bawaslu recorded in the 2020 regional head elections there were 342 suspected cases of violation of civil servants neutrality as of June 19, 2020.

The fourth potential vulnerability is community participation. Participation in this case includes not only participation in exercising their voting rights but also actively participating in each stage of the election. For example, in the factual verification stage for individual candidate pairs, residents who support the candidate pairs are willing to be met by the verification team of the KPU, or at the voter data update stage, active citizens check and re-check whether they are registered on the voter list; residents are also expected to actively participate in conducting participatory supervision at each stage and report suspected violations.

Under normal conditions, several things that cause a low level of community participation in the elections are the distrust of the community towards the candidate pair, the disinterest with the candidate and the perceived lack of benefits from the elections[10]. In the covid-19 pandemic situation there is a possible cause for the decline in the level of community participation due to the concern/fear of the danger of covid-19 transmission. For this reason, the government and election organizers must actively disseminate information to the public on the importance of community participation. Without the participation of the community, there will be no regional head election with integrity and fair. In addition to the criteria for public participation, elections with integrity and fairness must meet the criteria of equality between citizens, legal certainty, free and fair competition between election contestants, professional, impartial and independent organizing institutions, integrity of collection and vote counting and fair and timely resolution of election disputes[11].

Conclusion

Indonesia will hold a regional head election 2020 in the midst of Covid-19 pandemic. There are 270 regions holding regional elections this year, consisting of 9 provinces, 224 districts and 37 cities. The voting itself will be held on December 9, 2020. Potential vulnerability in the regional head election this time includes 4 potential namely availability of budget, readiness of election organizers, the emergence of many allegations of violations and public participation. Recommendations from this study are collaborative efforts, coordination, and communication between the government and election administrators. In addition to increasing public participation is also needed so that the election of regional heads 2020 in Indonesia is quality and fair.

Correlation between Disability and Stigma on Leprosy Patient at General Public Hospital of Daha Husada Kediri

Srinalesti Mahanani[1], Desi Natalia Trijayanti Idris[1]

[1]*Lecturer at Kediri Baptist Hospital Health Science College, Indonesia*

Abstract

Leprosy is a disease that has a high burden in the community or called triple burden disease. Support from the family increase the confidence of individual to interact with others and building positive relationships. The purpose of this study was to explain the correlation between family social support and the prevention of disability in patients with leprosy at General Public Hospital of Daha Husada Kediri. The research design was Cross Sectional. Respondents in the study of Leprosy Patients who met the inclusion criteria at outpatient as many as 50 respondents used purposive sampling data collection techniques. The variables were disability and stigma on leprosy patients. The research instrument used a questionnaire filled out by respondents and more than 50% have moderate stigma and degree of disability in leprosy at most respondents have grade 1. Spearman Rho Test results $\alpha < 0.005$, $\rho = 0.035$. The conclusion was that there is a relationship between disability and stigma on Leprosy Patient at General Public Hospital of Daha Husada Kediri.

Keywords: *Leprosy Patients, Disability, Stigma.*

Introduction

Leprosy is called triple bursden disease. Leprosy can be cured, but if not treated it can cause permanent disability[1]. Leprosy if not handled carefully can cause disabilities, and conditions become a barrier for leprosy patients in living a community life to meet their socioeconomic needs. It is hoped that a support system for people with leprosy will be able to provide full support in efforts to prevent disability with good family support for leprosy. Based on the pre-research at General Public Hospital of Daha Husada Kediri it was found that some respondents had level 1 and 2 disabilities.

According to Kunoli, leprosy is a chronic disease caused by bacteria that attack the skin and peripheral nerves. The cause of leprosy is the bacteria Mycobacterium Leprae. Leprosy can actually be prevented by early diagnosis and regular and accurate treatment with Multi-drug Therapy (MDT).[2] The principle of preventing defects and their aggravation is basically checking the eyes, hands and feet regularly; protect the eyes, hands and feet from physical trauma and take care of themselves.[3] Long leprosy sufferers will show leprosy reactions with nerve pain, weakness, some skin lesions, eye pain, or signs of systemic disease due to bacterial infiltration. attacking the respiratory mucosa, bones, and testes. If leprosy is left untreated, it can cause skin tissue damage (skin, upper respiratory mucosal, finger bones and face) and nerve damage (causing loss of sedation/muscle weakness that is supplied by the affected nerve).

The factor related to disability in leprosy sufferers is the role of the family. This role is related to efforts to prevent disability where the patient with the support of good family members takes preventive measures. The role of the family is very important for aspects of care for family members, especially in curative efforts (treatment). Every form of family social support has four characteristics, including informative, emotional attention, instrumental assistance and assessment assistance.[4] The purpose of this study is to analyze the Relationship between Family Social Support and Disability Prevention for Leprosy Patients at General Public Hospital of Daha Husada Kediri.

Method

The design of this study used a cross sectional design, a study that emphasizes the time measurement/ observation of the independent and dependent variables only once at a time. The population of leprosy patients at General Public Hospital of Daha Husada Kediri is

50 respondents. The sampling technique used in the study was purposive sampling. The dependent variable of this study is stigma, while the independent variable is disability. The research instrument used the ILEP stigma kueisoner and the WHO measure of disability. The analysis used in conducting hypothesis testing to determine the relationship between disability and stigma in leprosy is the Spearma rho test.

Result

Table 1: Stigma on Leprosy Patient at General Public Hospital of Daha Husada Kediri (May-June, 2020)

Stigma Category	f	%
Mild	0	0
Medium	4	11,43
Moderate	18	51,43
Heaviness	13	37,14
Jumlah	35	100

Table 2: Degree of Disability on Leprosy Patient at General Public Hospital of Daha Husada Kediri (May-June, 2020)

Degree of Disability	f	%
0	3	6,0
1	35	70,0
2	12	24,0
Jumlah	50	100

Table 3: Correlation between Disability and Stigma on Leprosy Patient At General Public Hospital of Daha Husada Kediri (May-June, 2020)

			Degree of Disability	Stigma
Spearman's rho	Degree of Disability	Correlation Coefficient Sig. (2-tailed) N	1.000 50	.299* .035 50
	Stigma	Correlation Coefficient Sig. (2-tailed) N	.299* .035 50	1.000 50

The results of the Spearman's Rho statistical test using computer software, based on the level of significance set at $\alpha < 0.005$, the results obtained $\rho = 0.035$, it means that there is a relationship between disability and stigma in leprosy patients at General Public Hospital of Daha Husada Kediri.

Discussion

Prevention of Disabilities in Leprosy At General Public Hospital of Daha Husada Kediri.

Based on the results of a study of 50 respondents about the prevention of disability in leprosy at General Public Hospital of Daha Husada Kediri, the most respondents had sufficient disability prevention as many as 75% respondents

Disability is a term used to cover three aspects, namely damage to structure and function (impairment), activity limitations and problems of participation (participation problems). These three aspects are very much influenced by individual factors and environmental factors. Efforts

to prevent disability can be carried out at home, health centers or referral service units such as public hospitals or referral hospitals. Patients must understand that MDT treatment can kill leprosy germs. But defects in his eyes, hands or feet have already occurred and will remain throughout his life, so he must be able to carry out self-care regularly so that the disabilities do not get worse.[5]

Behavior in an effort to prevent disability and increasing disability at home is sufficient. Many things affect the prevention of patient disability, namely the patient understands the condition of his body by carrying out the 3M principle, namely, checking the eyes, hands and feet regularly, protecting the eyes, hands and feet regularly, caring for the eye, hands and feet of physical trauma, caring for oneself. It can be proven that leprosy patients in examining their eyes, hands and feet have sufficient preventive behavior. It is supported by the results of the research that most of the knowledge about leprosy in general, however, knowledge in efforts to prevent disability through regular treatment is sufficient. In addition, the current level of disability also affects the prevention of disability, the disability experienced by lepers causes leprosy patients to be careful when doing a job, therefore people with leprosy must always protect, examine and care for their eyes, hands and feet so that disability does not increase to severe.[6] This is evidenced by disability prevention obtained from 50 respondents, there are 5 respondents who have sufficient disability prevention behavior with a percentage (75.4%) in statement number 12, namely so that I do not get hurt while working I do not do parts that are dangerous to my hands.

Based on the results of a study of 50 respondents regarding the prevention of leprosy disabilities at General Public Hospital of Daha Husada Kediri, Kediri, more than 50% of respondents examined their eyes, hands and feet, only 69.2% respondents.

Based on the theory, how to keep your eyes in good condition when your eyes feel dry is to close your eyes as often as possible.[7] Often look in the mirror to see if there is a foreign object or redness in the eye. How to check the hands or feet when there are cuts or blisters can also affect the risk of deformity or increased defects. On the hands often stop and check the hands carefully for cuts or blisters, generally if the skin is Dry hands are accompanied by numbness causing muscle weakness or even paralysis. Therefore always check for possible dryness of the hands and fingers, check the hands regularly for injuries that may occur due to using the hands with bent fingers. On the feet, routinely check the feet for any parts of the feet that have cracks and injuries. Therefore, often stop and check the feet for even minor cuts or bruises or abrasions.[3]

Based on the results of behavioral leprosy patient research, it is sufficient to examine the eyes, hands and feet. This is because the patient understands enough about how to regularly check his eyes, hands and feet. This is evidenced by the prevention of disability obtained from 50 respondents, there are 9 respondents who have the behavior of examining their eyes, hands and feet both with a percentage (84.1%) in statement number 8, namely when walking I avoid friction from shoes/ sandals or sharp objects such as thorns, glass and wire to prevent injury to the leg. The age factor can also affect a person's health. The higher the age of a person, the bigger the person is also suffering from various diseases. The high age must be balanced with a healthy lifestyle such as routine checking of the eyes, hands and feet so that disabilities do not increase.

Based on the results of research from 50 respondents regarding the prevention of leprosy disabilities at General Public Hospital of Daha Husada Kediri, most of the respondents protect their eyes, hands and feet, only 78.8% respondents.

Protects the eyes, hands and feet from physical trauma. Provides protection to the eyes from dust and drying out the eyes. Protect your hands from objects or the environment that cause harm, for example: fire, knives, etc. Protects the skin of the hands from objects that are easy to cause injury such as: sharp objects, heat. Use tools for everyday activities that are modified for use by crooked fingers. To prevent the broken feet from getting more deformed, it is advisable to always wear shoes so that the fingers do not get tangled. Prevent dry skin by soaking feet for 20 minutes every day in plain water, rubbing the thickened area with direct rubbing stones, smearing (without drying) with coconut oil to moisture the skin. Protect your feet by wearing footwear, dividing household tasks so that other people do the dangerous parts if your feet are numb.[8]

Based on the results of research on leprosy patients in taking preventive measures by protecting body parts that can cause disability and increasing disability, this is because protecting the eyes and feet can reduce the risk of injury, so patients need to get education and attention

every time they exercise control in health services. This is evidenced by the prevention of disability, obtained from 50 respondents, there are 4 respondents who have good behavior in examining their eyes, hands and feet with a percentage (75.9%) in the statement about me not doing the part that is dangerous for numb feet. In addition, work also affects the prevention of protecting the eyes, hands and feet, the higher the workload, the higher the disability. This can be proven because most of the leprosy patients work as entrepreneurs, if the patient does not protect the eyes, hands and feet then the disability can occur and the disability will increase.

Based on the results of a study of 50 respondents regarding the prevention of leprosy disabilities at General Public Hospital of Daha Husada Kediri most of the respondents treated their eyes, hands and feet as many as 73.1% respondents.

Take care of the eyes, hands and feet. If they feel dry, give an eye patch at rest. If there is, no matter how small, take care and rest some of it until it heals. Soak for 20 minutes every day in water, clean thick skin (not drained) then smear with coconut oil or other oil to keep moisture. Caring often maybe every day using hands to straighten joints -Joint and prevent heavier stiffness. Take care of your semper legs so they don't get worse by sitting with your legs straight forward. Prevention of wounds if there are bruises or small abrasions, immediately treat and rest the feet until they heal, namely resting the feet. Give eye drops containing saline, if the eyes

Based on the results of the study of leprosy patients in the behavior of caring for the eyes and feet, it is sufficient to understand the things that cause disability. The consequences that occur are not done every day which can prevent disabilities and increasing disabilities in sufferers so it is very necessary to carry out preventive behavior, but patients tend not to pay attention in the act of caring for oneself. This is evidenced by the prevention of disability obtained from 50 respondents, there are 4 respondents who have good behavior in examining their eyes, hands and feet with a percentage (82.6%) in statement number 18, namely I treat numb hands by avoiding hot objects and sharp. Therefore, the treatment that leprosy patients should do is soak for 20 minutes every day in water, clean the thick skin (not dried) then smear it with coconut oil or other oil to keep moisture, straighten joints and prevent heavier stiffness.[9]

Correlation between Disability and Stigma in Leprosy Patients at General Public Hospital of Daha Husada Kediri

The results of statistical tests using Spearman's Rho at the level of significance set at $\alpha \leq 0.05$ obtained results of $\rho = 0.053$, where $\rho > \alpha$ which means there is a relationship between stigma and disability in leprosy patients at General Public Hospital of Daha Husada Kediri.

Based on the results of the data research, it was found that the majority of respondents experienced sufficient stigma, that is, most civil servants experienced severe stigma, namely 3 respondents or (75.0%). The results of this study are inversely proportional to research (Soedarjatmi et al., 2009) Most of the patients do not work, apart from finding it difficult to find work for leprosy patients, they are afraid if their leaders and friends know that the respondent has leprosy and the respondent is very aware that fatigue will result in a recurrence of the disease. By not working, the respondent stated that they had no income.

Leprosy has a wide impact on the lives of sufferers, from marriage, work, personal relationships, business activities to their attendance at events in the community. Most of the respondents have suffered from leprosy between 1 year and 5 years, in this long period of time the respondent must always seek medication and take medication as regularly as possible, if it is late for treatment, the respondent states that the disease will reappear. Stigma causes discrimination so that it is difficult to find accommodation and work because of the clinical manifestations that arise and the complications that occur. People also feel reluctant to live side by side with leprosy patients. Most of the leprosy patients are civil servants because civil servants can elevate a person's social status to the highest level, giving more respect from society, so if leprosy patients get stigma then their social status will decrease. One of the impacts caused by stigma is the occurrence of physical disability. Based on the results of the study, it was found that the level of disability 2 was more than 50.0% namely 60.5% respondents. Stigmatization because physical disabilities are part of the group with physical deformities so that there are visible deformities in leprosy patients.

Conclusion

Leprosy patients at General Public Hospital of Daha Husada Kedirihave moderate stigma and disability degree is grade 1. However, there is a relationship between stigma and disability on leprosy patient at General Public Hospital of Daha Husada Kediri.

For people with leprosy, they can take preventive measures for disability and increasing disability by implementing the 3M principle, checking, protecting and treating, so that disabilities do not increase and they can carry out activities so that they do not affect the fulfillment of daily needs. In addition, the need for health education to families and lepers about the importance of the role of the family in preventing disability to help the healing process for leprosy patients.[10]

Recurrence Rate of Surgical Resection with Reconstruction of Plate Osteosynthesis in the Ameloblastoma Treatment

Suha Mohammad Sami

Professor, Department of Maxillo Facial Surgeon, College of Dentistry, University of Kufa, Najaf, Iraq

Abstract

This study was conducted to treat patients with primary ameloblastoma and solid/multicystic ameloblastoma histopathologically. Twenty-seven patients with primary ameloblastoma were treated in the period between 2008 and 2019 in the Department of Oral and Maxillofacial Surgery, and these patients ranged from 16 y to 58 y old and the average age was 37 y. The number of males reached 16 individuals and the number of females 11 individuals. Twenty-two patients with solid/multicystic ameloblastoma histopathologically were treated for partial jaw excision along with the restoration of bone plate osteosynthesis and 2 cm was used to remove a surgical free margin with bone correction, and three patients with bone metastasis were treated with excision, and the marginal jaw was removed with a 1 cm free margin with a reconstructive bone structure. Patients with unicystic ameloblastoma were treated through partial removal of the lower jaw with bone structure with titanium, and 1.5 cm was used as a free margin useful for bone health. There are 3 patients out of twenty-two infected primary solid/multicystic ameloblastoma were present with cases of repeated visualization of radiation are sick after 7 y of surgery and during routine follow-up, one patient was offered during the 6 y after the operation.

Keywords: *Surgical resection, reconstructive plate, ameloblastoma, radioactive tumor.*

Introduction

The odontogenic benign epithelium neoplasm behaves as a radioactive tumor that can expand but grow slowly. It is worth noting that there are several factors help in inflammation, tooth decay, nutritional deficiency, and indefinite irritation from extraction. Benign toxic epithelial neoplasms act as an expanding, but slow-growing, radioactive tumor. They occur largely in the posterior regions of the lower jaw and tend to recur again unless they are insufficiently removed. It should be made clear that ameloblastoma makes up 14% of odontogenic tumors of the mandible and maxilla[1]. Aggressive growth is nothing but a local invasion, with 70% of cases turning into malignant tumors and 2% of them are considered tumors[2].Many previous studies have proven that the age of these patients ranges from thirty to sixty years[3].Also, it appears from 10% to 15% of ameloblastoma lesions that appear in childhood and form a high percentage of 25% in Asia and Africa[4]. So histology of ameloblastoma tissue is very similar to enamel organ, which forms teeth[5].Many theories assume inflammation, shock, and tooth decay[6]. However, the reason for this stems from a lack of nutrition, unspecified irritation from extraction, or fever, which may lead to a disruption in the growth of dental bud; however, there is a great similarity between dental bud and ameloblastoma in cytokine expression[7].Another theory centered on the morphological differentiation of ameloblasts from pre-ameloblasts, which originally came from the development of the bell stage[8].However, the stratum intermedium will prevent the formation of ameloblasts at the bell stage[9]. However, the stellate reticulum will later dissolve to form a very fine sac of tumor nests, which later formed a larger area of cysts that would later be given ameloblastoma multicystic appearance[10]. The molecular pathogenesis of ameloblastoma occurs

due to a defect in the mitogen-activated protein kinase (MAPK) pathway[6], BRAF, a serine- threonine protein kinase activating the MAPKERK signaling pathway has been implicated in 63% of ameloblastoma[11,12]. However, BRAF at codon 600 mutations[13] and BRAF protein mutations will later turn into neoplasm[14]. Non-MAPK signaling genes like G protein-coupled receptor, smoothened (SMO), and SHH signaling pathway in affected ameloblastoma[15]. Likewise, mutations in genetic factors and the consequent cases of differentiation and formation of teeth, which are extremely important for dental development, have been involved in the development of ameloblastoma[16]. According to the World Health Organization report centered on dental tumors, which were classified according to the biological behavior of benign and malignant ameloblastoma[7]. In each of these tumors, there is a difference in pathological anatomy and anatomical location. There is solid/multicystic ameloblastoma[17], peripheral (or extraosseous) ameloblastoma, andunicystic ameloblastoma.As for malignant ameloblastomas, it will be divided according to the order of frequency, primary ameloblastic carcinoma[7], metastasizing ameloblastoma (secondary peripheral ameloblastic carcinoma),and secondary intraosseous ameloblastic carcinoma. On the other hand, the traditional solid or polycystic form is approximately 91%, and this will display both follicular and plexiform types. In this context, the unicystic ameloblastoma is the second most common benign tumor, accounting for 5-15% of all types(18). There are two types of parietal and glossy pathological tissues, which show that there are plexiform and follicular patterns[19]. It is worth noting that the diagnosis of malignant ameloblastoma is made by functional imaging that combines both PETCT, which is used to study the infiltration of soft tissues and metastasis and imperative for histopathological examination and subtype. The epithelium of ameloblastoma may arise from epithelial cell rest of Malassez, or epithelial lining of a dentigerous cyst or cells of a sheet of Hertwig's or may arise from heterotopic epithelial cells of other organs like the pituitary gland[20]. Ameloblastoma treatment may be through surgical or non-surgical type, and from the surgical point of view,this may be conservative or maybe radical surgery. But the approach to conservative surgery is enucleation and cauterization, curettage, cryotherapy, or marsupialization. This method is extremely important because it maintains tissue in its natural form and reduces facial deformation but is associated with a high recurrence rate, especially for the aggressive type[21]. As for the frequent type of aggressive and biological treatment, it would be better if the block resection was performed with free save margins and reconstruction of the defect by grafts[22]. Therefore, the rate of treatment and recurrence[23] in this is illustrated by clarifying what are the clinical features and aggressive histological pattern. But aggressive surgical treatment with peripheral ameloblastoma will reduce the frequency of irrespective of age[24]. The localized invasion of ameloblastoma leads to repeated treatment after recurrence, and the reason for this is due to the way the patient provides treatment early, which means that the approach to treatment is represented by the presence of different tissue variables or because of the presence of pituitary tumor cells at the site of surgery, especially in solid places, polycystic, and conventional and luminal unicystic type if treated by conservative surgery[25]. Whereas, solid/multicystic ameloblastoma and malignant ameloblastoma are much higher[26]. The main objective of this study was to study the results of repeated ameloblastoma treatment by surgical resection *en bloc* tumor with wide bone margin and the use of bone reconstructive plate osteosynthesis.

Data collected to serve the study goals includesex, age, clinical findings, the progression of the tumor, abnormalities of the face and jaw, imaging findings to detect extension of lesion, management, histopathological pattern, clearance of surgical margins, length of follow-up, and time to recurrence. While the patients were diagnosed through a histopathological examination, this was based on what the World Health Organization attached to the tissue type. The treatment is the partial excision of the procedure with a free safety margin because of the high probability of regional invasion. It must be clarified and indicated that the bone margin represents the distance from the radiographic margin, which is expected to be free of diseases and tumors to conduct bone operations. Often, the healthy mucosa covering the cortical hole is removed as a margin. The bone margin is 10-15 mm for benign unicystic ameloblastoma and 15-20 mm for solid/multicystic type and resection with marginal amandiblactomy for peripheral ameloblastoma, with bony defect reconstructions through reconstructive bony plate osteosynthesis[27].

Results

The results of this study showed that the number of male patients was 16, and they constituted 59.3% of the total patients were in this study. The number of female

patients was 11, which constituted 40. 7% of the total number of patients in this study.As for the age of the patients were in this study,which ranged from 16 to 58 years, but the majority of the ages were between 30 and 39 years, which constituted 44.5%(Table 1). Twenty-two patients were histopathologically treated by partial resection of the lower jaw, along with the completion of the restorative bone-building process. This purpose of about 2 cm was used to remove a surgical free margin with bone correction. Three patients had an extraosseous type of ameloblastoma and those were treated by soft tissue excision and marginal mandibular resection were treated with a portion of the free margin equivalent to 1 cm of muscle with the bone, with reconstructive bone plate osteosynthesis, besides that it applying a bone repair process(Figure 1a-f).

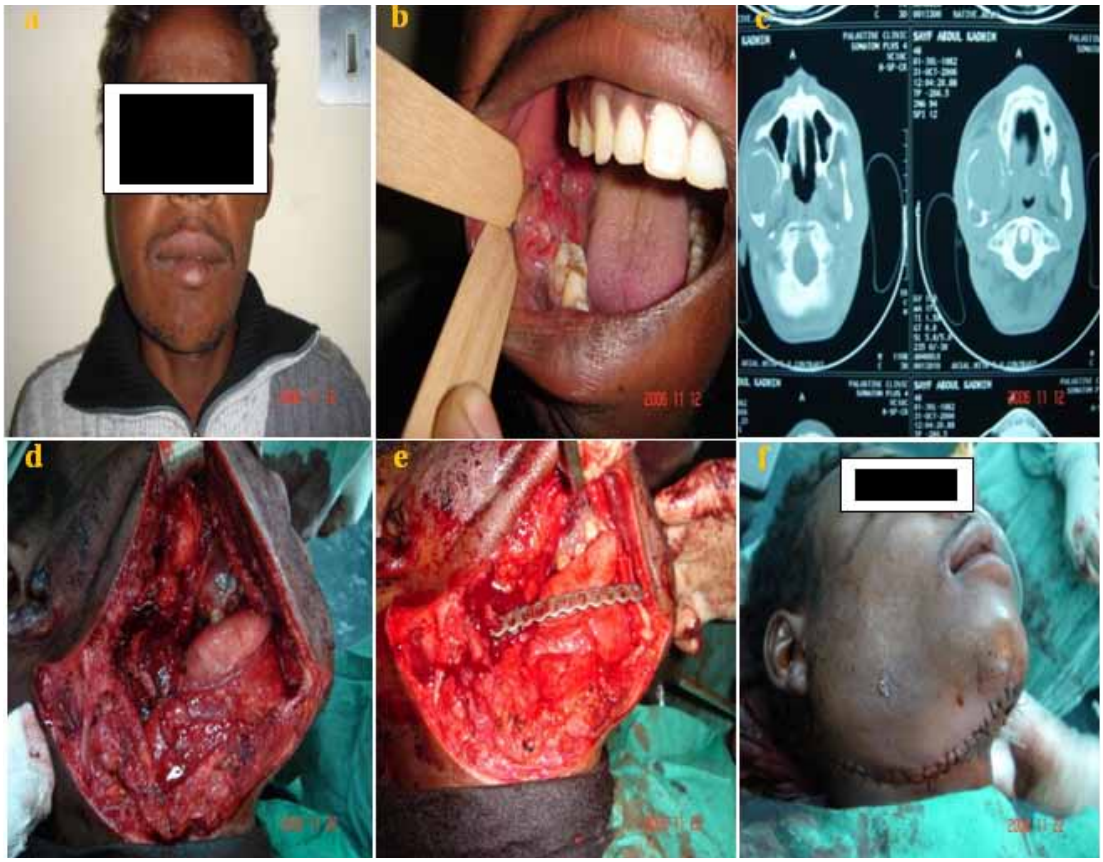

Figure 1: (a) Extraoral swelling. (b) Intraoral tumor. (c) Axial CT.(d) Mandibular segmental resection. (e) Performed reconstructive plate. (f)Postoperatively

The results showed that two patients had unicystic ameloblastoma and were treated by segmental resection of the mandible with titanium reconstructive bone plate osteosynthesis; thus, 1.5 cm was used as a margin with some health of bone (Table 2).

Table 2: Distribution of ameloblastoma and type of surgery with a recurrence rate

Type of ameloblastoma	No. of Patients	Type of Surgery	Free Margin (cm)	Recurrence Rate
Extra osseous ameloblastoma	3	Marginal mandibulectomy Resection of soft tissues.	1	1
Solid/multicystic ameloblastoma	22	Segmental resection+ titanium Reconstructive bone plate.	2	3
Unicystic ameloblastoma	2	Segmental resection+ titanium Reconstructive bone plate	1.5	0
Total	**27**			**4**

The patients were present in this study were monitored regularly by ten-eleven years clinically and radiographically to detect recurrence. The results of the study revealed that three of the patients complained of the repetition of ameloblastoma type solid/multicystic radiographically, but there was one patient appeared in the frequency of radiography whose primary type was an extraosseous type of ameloblastoma (Figure 2).

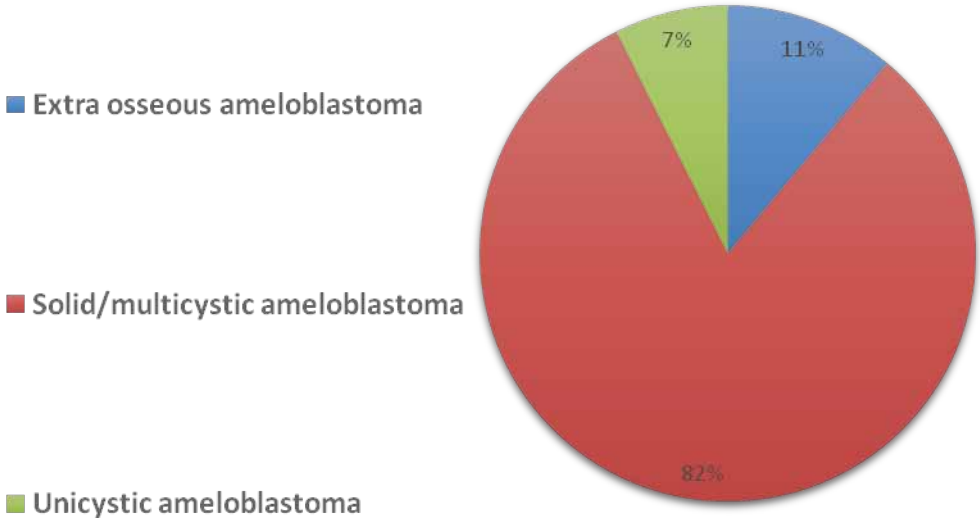

Figure 2: Ameloblastoma vs. number of patients

Two patients received surgery during routine follow-up after seven years, and there is one patient came six years after the operation. Also, there was one patient suffered from primary peripheral ameloblastoma (extraosseous) after nine years of surgery, and that there were four patients were presented with twenty-seven were operated as primary ameloblastoma, the recurrence rate was (14.8%).

Discussion

Admantinoma is considered a dental polyp, and this is what Ivory and Churchill called what is known as ameloblastoma[28]. As for the results that have to do with the age group, according to what was mentioned in this study, the average age ranged 30-39 years. This is in line with Fatemah Faras *et al.* (2017) study, which stated that the average age was 20-40 years, while the age group that was present in Andrew (2015)[27] study ranged 30-60 years, i.e. ameloblastoma It was introduced during the third and fourth decades of life[17]. In this study, radical surgery was addressed with appropriate margins, so that twenty-two patients with solid/multicystic ameloblastoma were treated through partial removal of the lower jaw with the completion of the restoration and bone-building process, as 2 cm was used as an important surgical free margin to maintain bone health. Three patients were suffering from an extraosseous type of ameloblastoma, and those treated with resection of soft tissues and marginal mandibulectomy with a 1 cm free margin part of the muscle that communicated with the lesion was removed with the bone, with reconstructive bone plate osteosynthesis was applied. Likewise, the results of the study showed that there are two patients with unicystic ameloblastoma were treated by segmental resection of the mandible with titanium reconstructive bone plate osteosynthesis so that 1.5 cm was used as an important margin for dental health.

Conclusions

The treatment depends on several factors, the most important of which is the aggressiveness of the tumor, duration, extent, size, histopathological type, and radiographically appearance, especially if the radiation is multi-site while maintaining an indefinite margin. As for the recurrence of occurrence, it depends on the age of the patient, anatomical site, molecular histopathology, genetic mutation, and/or density of bone, which is the main barrier to the repetition of the local area, so aggressive surgery is a good indicator of removing the tumor. Also, the frequency is affected by the type of molecular etiological cause, how early patientsreceive treatment, and type of surgery affected the recurrence rate of ameloblastoma.

Ethical Clearance: This study was approved by the Ethics Committee, University of Kufa. The study protocol was thoroughly explained for using samples of patients and written informed consents were obtained from them prior to participation in the study. This investigation was done according to the principals of the Declaration of Helsinki. All patients were informed about the aims and protocol of the study.

Older People with Urinary Incontinence: A Nurse Practitioner' Role in the Assessment and Management

Supichaya Wangpitipanit

Lecturer, Ramathibodi School of Nursing, Faculty of Medicine Ramathibodi Hospital, Mahidol University, Bangkok, Thailand

Abstract

Urinary incontinence is a common problem symptom of urination, an inability to control the urinary excretion on its own, causing a loss of the ability to control urination. Most often, this happens in situations where urination is not ready and accidentally slips out. The symptoms will cause hygiene problems, such as a wound rash, or red marks on the wrong skin until the subsequent infection problem is also a problem for physical health, impacting the mind, economy, and society. It is a health problem that affects physical, mental, emotional, and social aspects lead to reduced quality of life. Older people with urinary incontinence problems, it is caused by several reasons and factors that can cause various issues. This article aims to describe urinary excretion mechanisms, meaning, types and effects, method for assessing urinary incontinence, and primary care guidelines for the older people and their families providing home and hospital care. Therefore, nurse practitioners' action plays a significant role in helping older people with urinary incontinence. It is a service through four dimensions: prevention, medical treatment, and nursing care, health promotion, and rehabilitation. Furthermore, medical history taking by interviews, physical examination, and self-assessment those are the service nurse roles: health care provider, health educator, counselor, coordinator, and advocator in the follow-up and contact for improving caring to receive quality care and reasonable to continue to bring an as good quality of life.

Keywords: *Assessment, management, nurse practitioner, older people, role, urinary incontinence.*

Introduction

Urinary Incontinence (UI) is one of the symptoms of geriatrics syndrome, more common in older people. It is a symptom of urination and unable to control urination on their own. It is a loss of the ability to control urine flow. Often this happens in situations where urination is not ready, and it slips off.[1,2,3] The excretion system is a normal process to get rid of the parts that the body does not want, maintain the balance in the body, and prevent toxins from the residue of these waste. The mechanism of urinary excretion each time, it is caused by the interaction of the central nervous system from the brain and spinal cord with the peripheral nervous system.[4,5] It consists of a sympathetic or hypogastric nerve (T11-L2) and parasympathetic or pelvic nerve (S2-4). Itsends nerve impulses to regulate the bladder muscles to control the external urethral sphincter to be ready to urinate. When the bladder receives approximately 150-200ml of water in the urine, more pressure is generated inedin the bladder, the lower bladder nerve endings are stimulated and sent through the spinal cord, an afferent impulse directed to the micturition center to interpret the sensation of urinary pain. If in a place not ready to urinate, the brain sends signals from the basal ganglia and frontal lobe to restrain the bladder muscles from contracting, allowing them to continue urinationion. When living in the bathroom or the right place, the midbrain's urinary control center orders an efferent impulse to the bladder to compress along with the sphincter of the urethra. Each urination is approximately four to eight times a day without incontinence.[4,5]

Research reviews presents the situations older people with urinary incontinence. The prevalence was 15-30% in the nursing home but in home bound requiring long-term care of the older people found in as much as 60-70%. We met that older age would affect deterioration. The severity of urinary incontinence symptoms, mainly aged 80 and over were more likely to have signs and the severity of urinary incontinence problems.[2,3,4] Female was twice as common as males. Most will occur the amount of urine emit 200-500ml to up to 1,000ml per day.[2,3,4] Older people with urinary incontinence symptoms will cause hygiene problems, such as a wound rash, or red marks on the wrong skin until the subsequent infection problem is also a problem for physical health, impacting the mind, economy, and society, and are significant and affect to the self-care ability. The nurse practitioner should be aware of the importance of urinary incontinence problems and make appropriate nursing plans to deal with issues that occur and ultimately reduces the impact that will appear to have a better quality of life and other topics for both family and community.

Material and Method

An integrative review is the most comprehensive approach of study have a wide range of purposes, such as the definition of urinary incontinence, type of urinary incontinence, risk factors for urinary incontinence, evaluation of urinary incontinence, and management and interventions. For that, the PICO strategy was considered the most appropriate model for developing the review question, confirming that the question's relevant components were well defined.6 Thus, following the PICO strategy, was: (P) older people with urinary incontinence and their family caregivers; (I) intervention, management, and treatment; (C) non-exclusive operation and (O) nursing practitioners' role. The starting point that outlined the inclusion criteria: studies in which the reported outcome was nurse practitioners with healthcare roles. All articles published between January of 2006 and July of 2020, written in English that did not fall under these criteria, including only review articles. Therefore, this article is interested in reviewing related documents to the content of older people with urinary incontinence, guidelines for symptom assessment, management, and nursing in nursing practitioners' role for the caretaking of the older people.

Findings:

Urinary Incontinence: Definition "urinary" refers to urine or to the parts of the body that produce and carry urine, and wording "incontinence" is the lack of ability to control or inability to control the excretion of urine or the contents of the bowels.[7] Older people with urinary incontinence had caused a loss of the ability to control the urination; urine leakage poured out came by accident, a malfunction of the bladder to the urethra in the urinary system. Therefore, urinary incontinence refers to symptoms and the inability to control urination on their own. The subsequent physical effects are skin infections, incontinence associated dermatitis, urinary tract infection, and sepsis. The fluid in the urine that frequently flows on the skin, resulting in redness and dermatitis for skin with moisture that cannot control excretion. The contact of human skin is weakly acidic. Still urine and feces are alkaline when the acidic skin is in contact withurine just 5-15 minutes. It rubbed on clothing or pads will irritate the skin, loss of moisture destroying the skin layer orphaned to the dermis, seen as a red rash around the perineal and groin and coccyx where the skin is peeling and bruises easily. As a result, microorganisms grow as a cause of odors. There is a chance of infection from bacteria and fungi.[2,5,8]

Type of urinary incontinence: It can be temporary as transient incontinencecured once the cause has resolved, or a permanent solution must be with urinary incontinence at all times. Must bring constant medical care; symptoms of urinary incontinence can be categorized in five categories[2,3,4,8] as follows:

1. Stress Incontinence is a cough and sneezes caused by increased intra-abdominal pressure will stimulate the control of urinary incontinence.
2. Urge Incontinence is an overactive compression of the bladder as detrusor overactivity. It is symptomatic when a rushed situation caused the urge to urinate too quickly, unable to hold it in time to go to the toilet.
3. Mixed Incontinence is a cough and sneeze that causes increased intra-abdominal pressure along with overactive bladder compression.
4. Overflow Incontinence is an excess flow of urine, causing the urine to flow and unable to hold the urine.

5. Functional Incontinence is as urinary incontinence coexists with pathological problems such as spinal cord injury, or diseases related to the spinal cord.

Risk factors for urinary incontinence: The primary cause factorsto risk factors areelements in the deterioration of the body. The genital area's work decreased bladder contractions urine changes during the day, the active sphincter decreases, and reduced bladder capacity, or from an abnormality in the bladder area, have any underlying disease affecting urinary incontinence, a chronicillness,comorbidity, including diabetes mellitus, high blood pressure, dementia, confusion, or disease with brain disorders, the spinal cord nervous system, etc., heavier or constipation, or chronic constipation, having surgery on the pelvic floor organ, being older than 40 years, multiple vaginal births, eating caffeinated beverages, drinking more water, drink alcohol. changes at home environment, there is an obstacle makes going to the bathroom uncomfortableor other factors that increase urination, and getting drugs related urinary incontinence as diuretics reduce blood pressure, or drugs that may affect urinary incontinence in different groups, and focusing on their rational drug useed as follows: α-Adrenergic agonists (M), α-Adrenergic blockers (W), ACE Inhibitors, Anticholinergics, Antipsychotics, Calcium channel blockers, Cholinesterase inhibitors, Estrogen (oral), GABAergic agents, Loop diuretics, Narcotic analgesic, NSAIDs, Sedative hypnotics, Thiazolidinediones, and Tricyclic antidepressants.[3,5]

Evaluation of urinary incontinence: The strategies assessing urinary incontinence are available at different levels, depending on the cause and severity of the symptoms. If symptoms are severe, they would like to evaluate and deliver hospitalized treatment from a urologist.[3,5]The critical evaluation principles areas follows:

1. Medical history taking: focused on the main symptoms, a current history of illness, past illness or lifestyle the ability to perform routine tasks based on history taking principles that enable the ability to memorize a history taking approach using the law of memorization "OLD CARTS"as mnemonicswith the eight dimensions of a medical problem recalled using (Onset, Location/radiation, Duration, Character, Aggravating factors, Reliving factors, Timing and Severity)as (1) Onset: The period onset of sudden onset or gradually. (2) Location/radiation: What part of the body does the symptom occur? (3) Duration: How long do symptoms persist all the time, or how long does it take? (4) Character:Symptomsdescribe as feelings. (5) Aggravating factors: factors that trigger symptoms even more. (6) Reliving factors: Factors that cause symptoms to improve or disappear. (7) Timing/treatment: Primary behavioral treatment or management, and (8) Severity: The follow of feeling for older people with urinary incontinence.
2. Physical examination:the examination will focus on both visual and palpation by look for abnormalities, abdomen, pubic, bulging and palpation of the pubic area, look at full capacity urinary incontinence, and a neurological test for perineal and rectal sphincter called the "Bulbocavernosus reflex" by evaluation of spinal cord function responses, or to assess the stoppage of the spinal cord (spinal shock) at S2-S4 position. The examiner inserts a finger into the patient's rectum, then squeezes the head of the penis or stimulates the female clitoris if found. The anusconstricted around the fingers. Show that the test gave a positive result, or have a reaction. [3,5,10]
3. Laboratory test: It is composed of urine tests; urine analysisis a physical examination,color, clarity, specific gravity, the potential of hydrogen ion, and the excretion is compounds such as urobilinogen protein, glucose, ketones, nitrite, or evaluated for infection, and etc. The collected urine for testing is recommends to collect by clean-voided midstream urine method before, the genital area should be washed with soap and water thoroughly, and collect urine in the middle with aseptic technique.[3,5,10]
4. Initial examinations to assess symptoms of urinary incontinence at the lower urinary system including: A bladder diary is to recordfrecord frequencypad test use pads from sanitary napkins or diapers.
5. Specific examinations are to procedure-specific tests performed referred to a urologist [3,5,10] such as (1) Urodynamictesting is a urodynamic examination to determine the function of the bladder and sphincter. Measuring the pressure in the bladder while water flows in and out of the bladder with urinary retention capacity. (2) Uroflowmetry is a urine flow measurement to demonstrate bladder outlet obstruction,measure the amount, time spent, and urine output rate to determine bladder function while urinating. (3) Pressure Flow Study examines the relationship between the voiding pressure study

of bladder pressure while urinating and the flow rate of urine. (4) Urethral Pressure Profilometry (UPP) is a test for pressure in the urethra. Using to measure the ability of the urethral sphincter, and measure the pressure in the urethra to view urethra activity using a catheter with a pressure sensor inside the urethra.(5) Imagingis an x-ray, ultrasound, special diagnostic examination using computer tomography, and magnetic resonance imaging (MRI). (6) Cystoscopy is a bladder endoscopy that looks at the appearance of the urethra and the lining inside the bladder for diagnosis, monitoring, and treatment.(7) Electromyography (EMG) is an electrode of the pelvic muscles and nerves. The EMG has a small sensor to place close to the anus to examine the muscle and sphincter activity while water is inserted and emptied from the bladder, and (8) Post Void Residual (PVR) is a urine count test to check the amount of residual urine from urination. The remaining urine should not exceed 50 ml. If the measurement exceeds 200 ml, it is abnormal. It is measured after the patient has emptied immediately or not more than 10 minutes; people should urinate at least 80% of the bladder capacity.

Discussion

From the reviews, data present that the essential managements are a urine pad, adult diaper, behavior modifications, drinking water in amounts adequate, avoid caffeinated drinking beverages, weight control, prevention of constipation, and practice urinating by extending the time to urinate. The focus on pelvic floor muscle trainingwill affect the practice of daily activities necessary to undergo diagnosis for treatment such as getting medicine,using a vaginal pessary,and vaginal surgery, until insertion of a temporary urinary catheter or urinary catheter.Livelihoods and affect the quality of life that deteriorates, nurses must use a nursing process as follows: assessment, nursing diagnostic, problem planning, activities, and evaluation along with providing nursing care according to problems and needs promote knowledge of self-care enhance and practice the skills necessary for rehabilitation to prevent more complications and affect the quality of life in the future.[5,12] The main problem ofolder people with urinary incontinence is to contact the urine that frequently flows on the skin, causing redness and inflammation of the skin as incontinence associated dermatitis. Therefore, we should focus on three key areas: cleanliness, hydration, and protect injury from skin touching the edges of pants, always underwear that is dry and clean. There are no diaper folds or pads from prolonged sleep abrasionas evaluation at the perineal skin, groin, and coccyx, abrasions, redness, flaky patches, or pain. we should consult a medical professional, clean the reproductive tract properly and regularly every time to a urination. It is best to use a drug or apply a wide range of non-alcoholic with skin coatings and injuries, and always consult a medical professional.

For the older people who have symptoms of urinary incontinence who have no cognitive problems, and remembering movements by symptoms to mild urinary incontinence, such as incontinence, coughing, sneezing, or failing to go to the toilet slips less often than 1-2 times a week. Behavioral therapy can help initially slow down the severity of symptoms, including bladder training, urge to urinate at scheduled times, such as every 2 hours, every 3 hours, or every 4 hours from prompt voiding, and have been accessible since the past until present, the pelvic floor muscle exercise, or kegel exercise. The beginning focuses on the location where we urinate, strain, and relax by tense, count 1-2-3-4-5 and release, start over, count 1-2-3-4-5, and freedom. If you can train longer, increase the number—1-2-3-4-5-6-7-8-9-10 and version, practice at least 100-200 times a day, 3-4 times a week. There is training that makes the ability to hold urine and control urination better. Also, exercises using biofeedback electrical stimulation from EMG-Biofeedback help us train the pelvic floor muscles more clearly. [5,12,13]

Nurse practitioner with roles in healthcare: Nurses are a person who helps human beings, helping in usual get well, or when sick, improve care for health promotion, primary medical care and uncomplicated treatment, disease prevention, and rehabilitation of patients with problems and needs of care. They should caregiving cover both at home or community based, and in the hospital-based.[5,12,13] as follows:

1. The health care provider is to provide assistance or take any action to benefit the service recipient. To address health problems of the service organization focuses on applying nursing processes covering four dimensions; health promotion, disease prevention, primary medical care, and rehabilitation of individuals, families, and communities, especially older people in their homes, from the nursing homes as nursing patients with chronic disease to have pressure sores for paralyzed at home.[14,15]

2. A health educator is the role of teaching, giving advice, and knowledge in self-practice to achieve behavior change or take care of yourself with target groups in various interventions. There are including individual health education teaching, personal discussion, group discussion by providing knowledge from exhibitions such as giving advice, behavioral adjustment to promote excretion, and teaching patients with their caregivers to self-rehabilitation.[14,15]

3. A counselor is to provide information, give knowledge and understanding, and, most importantly, offer guidance or alternatives to self-care until service recipients can decide by themselves. To overcome obstacles throughout the health care crisis possible by the client or their family from nurse practitioners who have to perform the mentoring role, they must have the knowledge and skills to be trained to express listening intently by studying or inquiring about the background of the service recipient.[14,15]

4. The advocator is the person who has the immediate benefit of receiving the right of treatment that should be obtained, including interests and patient rights, which is a fundamental human right. The families of older people with urinary incontinence should receive healthcare services when needed. The nurse practitioners should provide information on health services related to the exercise of the said right with equality and fairness.[14,15]

5. The coordinator refers to the role of communicating with health personnel such as volunteers, physicians, physiotherapists, pharmacists, dentists, and other groups that enable effective community operations. The role of coordination of geriatric practice nurses in the community includes contacting a physical therapist to help rehabilitate paralyzed patients, coordinating the department of social development staff to take care of the disabled without relatives to promote better care of the elderly at the community level. [14,15]

Conclusion

In conclusion,older people with urinary incontinence symptoms must have caring from an initial assessment of the problem and requirements. To prevent the occurrence of more severe issues of older people with symptoms of urinary incontinence will not be able to control the urination on their own. It is a loss of the ability to control urine flow. Often this happens in situations where urination is not ready, and it slips off came by accident. An affects the occurrence of physical, mental, social and physical health problems resulting in a decrease in quality of life. In the role of nurse practitioner focus on health promotion, disease prevention, rather than treatment and recovery of the individual or family together with the freedom to make decisions for ongoing health care or care problems, and improve the quality of life for the as competent individual, family and community level.

Abstract

Hepatotoxicity disorders are relatively common in patients with inflammatory bowel disease that includes ulcerative colitis and Crohn's disease. Abnormal serum liver functions tests can develop during treatment with (TNF-α) blocking agents, such as, Infliximab. The aim of this review is to clarify the role of infliximab in the development of liver enzyme abnormalities in patients with Crohn's disease. The most common presentation of infliximab -associated liver injury is a hepatocellular type with auto-immune features, marked by increased serum aminotransferases levels. Cholestatic injury is much less common, and marked by jaundice and increased serum ALP and bilirubin levels,with elevations of serum ALT and AST. Abnormalities of liver function tests in sera of patients with Crohn's disease typically resolve after discontinuation of infliximab, although sever liver injury leading to liver transplant cannot be ruled out.

Keywords: *Aminotransferase, autoimmune hepatitis, Cholestatic, Crohn's, hepatocellular, inflammatory bowel disease, Infliximab, liver.*

Introduction

Crohn's Disease: Crohn's disease (CD) is a chronic inflammatory condition characterized by discontinuous skip lesions affecting any part of the gastrointestinal tract from the mouth to the anus. It is encompassed in the term "inflammatory bowel disease (IBD)", which includes ulcerative colitis (UC) and CD [1]. Crohn disease is a chronic disease with an annual incidence ranging from 3 to 20 cases per 100,000. The median onset of disease is age 30 years and it has 2 peaks, first between age 20 and 30 years and then a smaller peak around age 50 years[2]. The origin of the disease is not entirely clear however several involved mechanisms have been postulated such as genetic predisposition and disruption of homeostasis regulation in the gastrointestinal tract [3]. The diagnosis and management of Crohn's disease is based on clinical signs and symptoms in addition to laboratory tests, endoscopy and imaging techniques[4]. Medical treatment for IBD typically targets inflammatory mediators including aminosalicylates, corticosteroids, immunomodulators such as methotrexate, and the biological therapies including anti-tumor necrosis factor (TNF) therapies[5]. The aim of this review is to clarify the role of infliximab in the development of liver enzyme abnormalities in patients with CD and its relationship to drug-induced liver injury (DILI).

Anti-Tumor Necrosis Factor Alpha Therapy: Biologic therapy with anti-TNF medication has been effective in treating inflammation and reducing complications in CD[6]. Infliximab, adalimumab, and certolizumab have been shown to be effective as both induction and maintenance therapy in moderate to severe CD[7]. In systematic review of Singh S et.al. It has been suggested through indirect comparisons that infliximab or adalimumab may be preferred as the first line agents, while ustekinumab preferred as the second line agent, for induction of remission in patients with moderate-severe CD[8]. In (Robbins L. et al.) study, anti-TNF alpha therapy successfully treated denovo CD in 28 out of 38 (74%) patients. Out of seventeen patients with CD who had failed to response to anti-TNF alpha agents before surgery and were treated with anti-TNF alpha therapy after surgery, twelve patients (71%) responded to the treatment[9]. A study of Buhl S et.al. reported that in total, 376 Crohn's disease patients had received infliximab. After 1 year of therapy 76 (20%) among them were classified as having response but non-remission. While it was found that there was no additional therapeutic

benefit after another year of treatment maintenance of infliximab for (n = 54; 71%), thus still having response but non-remission. Nineteen patients (25%) obtained remission during continued infliximab, whereas only 4% (n = 3) experienced treatment failure[10]. Loss of response LOR) to biologics in Crohn's disease is a significant clinical problem [11]. The rates of LOR are reported to be 50–54% in CD patients during 1 year of continuous IFX treatment [12] The rates of LOR are reported to be 50–54% in CD patients during 1 year of continuous IFX treatment[13,14]. While in other study indicated by meta-analysis that the incidence of LOR among adult CD patients undergoing IFX therapy is 34% [15]. Study by de Bruyn JR et.al reported that the failure to Infliximab therapy is associated with subclinical fibrosis in Crohn's disease [16].

There are numerous complications which have been described with the use of infliximab such as instances of cholestasis or hepatitis[45,47,50], induction of auto-immune/ immuno-mediated hepatitis[51-54], acute liver failure[55,56] and the need for liver transplantation[57,58]. In the earlier controlled trial of Infliximab in Crohn's disease minor elevation in levels of the liver enzymes weredescribed, but extreme elevations were rare, and no cases of liver failure or jaundice were found[21]. Cholestatic liver injury was described in one case report of a patient treated with IFX. The patient developed jaundice after the infliximab infusion, with high alkaline phosphatase levels accompanied by elevations in bilirubin, ALT and AST. The patient underwent liver biopsy which revealed "bland cholestasis". Cholestatic injury resolved within 4 weeks with supportive therapy and cessation of IFX[47]. Cases of AIH have also been demonstrated in patients with IBD receiving treatment[38]. Several cases have been reported AIH in CD patients who received infliximab therapy[51-54,59]. In one of these cases, Cravo *et al.*[51] reported a 38-year-old female suffering from Crohn's disease who required IFX. At the beginning of therapy, LFTs were normal, furthermore ANA as well as Anti-ds-DNA were negative. Importantly, 2 years into treatment with IFX, the patient developed transaminases and hypergammaglobulinemia. Serology results for viral infections were negative, moreover ANA, Anti-ds-DNA, in addition to antihistone antibodies were positive. ''Liver biopsy showed chronic hepatitis with inflammatory plasmocytic infiltrate in the portal tracts, interface hepatitis, and mild periportal fibrosis.''. So, the patient met the criteria for a definitive autoimmune hepatitis. During three-months period, after discontinuing IFX therapy, ANA titers reduced with normalization of LFTs[51]. In most reported cases of IFX-induced autoimmune hepatitis, the hepatitis resolved with discontinuation of infliximab and steroid treatment. Interestingly, in two of these reported cases, AIH resolved when switched to another biologic agent for example adalimumab (ADA) implying an absence of cross-reactivity[51,5 3]. This phenomenon can be related to IFX being a chimeric (part mouse, part human) monoclonal antibody, while ADA is a fully human antibody[22, 51]. In this regard, Rodrigues *et al.,*[60] described 8 cases of TNF-α blocking agents-induced hepatitis which was defined as ALT levels (>10× ULN) out of a cohortincluding 600 patients, with seven cases related to infliximab(3/7 patients with Crohn's disease). These 3 patients with Crohn's disease showed an autoimmune type of liver injury, with elevated levels ofaminotransferases. Two patients responded favourably to steroids with normalization of LFTs after the suspension of IFX.In one female patient, IFX therapy was restarted within three months after discontinuation of this agent, with no recurrence of the liver injury [60]. In the case reports of van Casteren-Messidoro *et al*[59] two females patients suffering from IBD developed AIH while receiving IFX. One case with Crohn's disease, developed AIH after the third infusion of IFX, with elevated serum transaminase levels up to (25 × ULN). During five-months period, after discontinuing IFX, and receiving azathioprine along with steroids, her transaminases normalized[59]. Crohn's disease, chronic inflammatory granulomatous condition of gastrointestinal tract, can rarely have extra-intestinal complications. Involvement of the vulva in CD is very uncommon[61]. Caussé *et al.,*[56] reported a case of IFX-induced acute hepatitis in a patient suffering from severe vulvar Crohn's disease. Her LFTs showed ten times the normal value of ALT, twice the normal value of AST, 1.5 times the normal value of ALP and three times the normal value of GGT. Due to the hepatitis, the IFX therapy was withdrawn[56]. Importantly, the latest case reports have described two rare cases of IFX-induced autoimmune hepatitis in patients with Crohn's disease that led to liver failure necessitating liver transplantation. One well-documented case by Estes et al.,[57] described markedly elevated levels ofaminotransferases and bilirubin, 5 months after starting IFX. Similarly, in another report by Wong *et al.,*[58] one such case developed 3 months after starting infliximab, with abnormal LFTs, low albumin level and jaundice.

Conclusion

Infliximab -associated liver injury is still a potential concern in patients with Crohn's disease. The most common presentation is a hepatocellular pattern of injury with auto-immune features, involving histologic changes which are similar to autoimmune hepatitis. This pattern marked by increased serum and AST levels. Cholestatic injury due to Infliximab is much less common, and marked by increased serum ALP and bilirubin levels,with elevations of serum ALT and AST. Symptoms generally include jaundice. In most cases, these patterns of injury improve and abnormalities in liver function tests typically resolve after discontinuation of infliximab, although sever liver injury leading to liver transplant cannot be ruled out.

COVID 19: Evaluate of Liver and Renal Function Tests in Iraqi Patients

Sura A. Abdulsattar[1], Mahmood Nazar Mustafa[2], Abdullah Ali Mohammed[3], Ahmed Salam Al-zaidi[4]

[1]Prof. Dr. (PHD) Department of Chemistry and Biochemistry, Mustansiriyah University, College of Medicine, Iraq, [2]Assistant Lecturer (MSc) Department of Pathology and Forensic Medicine, University of Fallujah, College of Medicine, Iraq, [3]Assistant Lecturer (MSc) Department of Chemistry and Biochemistry, University of Fallujah, College of Medicine, Iraq, [4](MSc) Department of Medical Analysis, Al-Furat General Hospital, Iraq

Abstract

The clinical features of COVID-19 are varied, ranging from asymptomatic state to acute respiratory distress syndrome and multi organ dysfunction. We aim to evaluate renal and liver functions of patients with COVID 19. Laboratory results were obtained from 107 patients with laboratory-confirmed COVID-19 whowere admitted to the only Al-Furat General Hospital in Baghdad, Iraq from March 3 to June 9, 2020 and followed up until recovery. Normal levels of renal functions were presented. Meanwhile elevated levels of alanine aminotransferase (ALT) was observed in 10% and of aspartate aminotransferase (AST) was observed in 40% of patients with COVID 19,yet on comparison of the results at entering with at recovery it was observed significant differences ($p<0.01$) of all patients. From these findings we conclude that the virus might be responsible for systemic inflammation.

Keyword: *COVID 19; liver enzyme;urea; creatinine; AST, ALT.*

Introduction

On 7 January 2020, a novel coronavirus was identified in the throat swab sample of one patient by the Chinese Center for Disease Control and Prevention (CDC), and was subsequently named as 2019nCoV by World Health Organization (WHO) [1, 2]. The virus was identified as a coronavirus that had >95% homology with the bat coronavirus and> 70% similarity with the SARS- CoV. Environmental samples from the Huanan sea food market also tested positive, signifying that the virus originated from there [3]. The number of cases started increasing exponentially, some of which did not have exposure to the live animal market, suggestive of the fact that human-to-human transmission was occurring (2020)[4]. All ages are susceptible. Infection is transmitted through large droplets generated during coughing and sneezing by symptomatic patients but can also occur from asymptomatic people and before onset of symptoms [5]. The clinical features of COVID-19 are varied, ranging from asymptomatic state to acute respiratory distress syndrome and multi organ dysfunction. The common clinical features include fever (not in all), cough, sore throat, headache, fatigue, headache, myalgia and breathlessness[6]. Some patients with COVID-19 pneumonia also present with kidney injury, and autopsy findings of patients who died from the illness sometimes show renal damage. However, little is known about the clinical characteristics of kidney-related complications, including hematuria, proteinuria, and AKI [7]. Recently, there has been some insight into the impact of COVID-19 on other organs, as a number of reports have indicated that more than half of patients with COVID-19 showed varying levels of liver disease [8]. The median time from onset of symptoms to dyspnea was five day, hospitalization seven day and acute respiratory distress syndrome (ARDS) eight day. The need for intensive care admission was in 25–30% of affected patients in published series. Complications

witnessed included acute lung injuryacute cardiac injury, shock and acute kidney injury. Recovery started in the 2nd or 3rd wk[9]. The various diagnosis method such as serological, molecular, and radiological can help the health centers in the detection of SARS-CoV-2; radiological and serological techniques are the best method among the others and the radiological method is the most preferred one, able to diagnose the infection quickly and accurately with fewer false-negatives[10]. Liver impairment has been reported as a common clinical manifestation in patients with SARS-CoV infection, even if not a prominent feature of the illness [11, 12].

Material and Method

This was a cross-sectional study, we analyzed biochemical data from electronic medical records of 107 hospitalized patients of Al-Furat General Hospital from Baghdad with COVID-19 (65 male and 42 female) for period (march 3 to June 9,2020). The data analysis included urea, creatinine, ALT, AST, and ALP twice: first at entering the hospital (group A) and second at recovery (group B).

Statistical Analysis: Continuous data were expressed as mean and standard deviation (SD). For the variables, paired test was employed to analyse the difference. All statistical analyses were performed using the SPSS 20.0 (SPSS Inc) software package. A (P value of < 0.05) was considered statistically significant.

Results and Discussion

The current evidence indicates that infection rates of COVID 19 are higher in male than in female (Figure 1), where 61 % (65 among 107) was male and 39 % (42 among 107) was female.

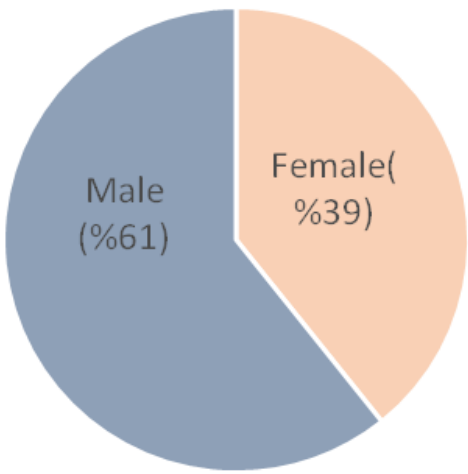

Figure 1: Covid 19 distribution among gender

The current results of COVID 19 distribution among age as shown in Figure 2 indicated that the most affected ages are between (20-40 year). The lowest affected ages was less than 20 year.

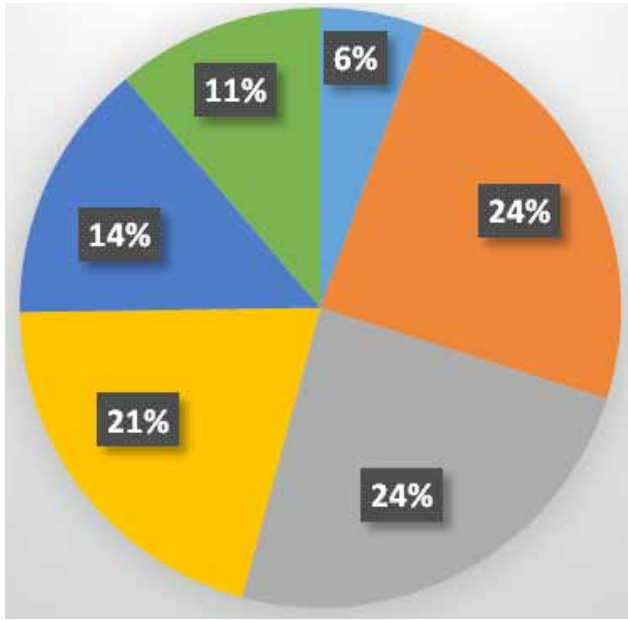

Figure 2: Covid 19 distribution among age where 6% : patients with age <20 year,24% : patients with age range (21-30 year) & (31-40 year)respectively, 21%:: patients with age range(41-50 year),14%:: patients with age range(51-60year),and 11% : patients with age (61-70 year).

The results presented in Table 1 shows the levels of urea, creatinine, AST, ALT and ALP in sera of COVID 19 patients over two periods: the first when entering the hospital (group A) and the second when recovery (group B). Levels of urea, creatinine, AST, ALT and ALP were showed within normal level, however there were a highly significant differences ($p<0.01$) between groups in urea, creatinine, AST in both male and female patients .While the results of ALT indicated highly significant differences ($p<0.01$) only in male patients. For ALP the results of male indicated highly significant differences ($p<0.01$) and for female the result showed significant differences ($p<0.05$).In more detail the results indicted elevated levels of AST in 40% patients and of ALT in 10% patients, while no elevated levels of ALP was observed.

Table 1: The levels of urea, creatinine, AST, ALT and ALP in sera of COVID 19 patients

Parameter	Gender	Mean±SD Group A	Mean±SD Group B	P value
Urea (mmol/L)	Male	4.29	3.48	0.00
	Female	4.33	3.21	0.00
Creatinine (mmol/L)	Male	74.58	69.67	0.00
	Female	72.78	68.47	0.00
AST (U/L)	Male	45.96	36.26	0.00
	Female	45.7857	36.1429	0.00
ALT (U/L)	Male	36.41	28.83	0.00
	Female	26.2381	24.2143	0.106
ALP (μkat/L)	Male	81.63	76.10	0.00
	Female	84.6667	76.7143	0.015

Although available sex-disaggregated data for COVID-19 show equal numbers of cases between sexes, current study indicates that infectious rates are higher in male than in female, and that may be due to sex hormone that contribute to different immunologic responses in men and women: As a general rule, estrogens promote both innate and adaptive immune responses, which result in faster clearance of pathogens and greater vaccine efficacy[13]. Conversely, testosterone has largely suppressive effects on immune function, which may explain the greater susceptibility to infectious diseases observed in men[14]. Notably, changes in sex hormone may further shape the immune response to pathogens[14]. Sex-related biological data may also be critical to investigate the contribution of sex hormones in inflammatory response. In particular, reduction in testosterone levels in aging men has been associated with increased proinflammatory cytokine levels [14] which may contribute to worse COVID-19 progression in older men. Sex differences in disease progression may also be linked to estrogen-induced decreased expression of angiotensin-converting enzyme 2[15] Pre-print studies are conflicting as to whether ACE2 expression in lung tissue is different between sexes[16,17]. Some patients with COVID-19 pneumonia also present with kidney injury, and autopsy findings of patients who died from the illness sometimes show renal damage[7]. In meta-analysis study of Zhu j et al indicated that some patients with COVID 19 (25.5%) presented elevated levels of renal functions[18]. The results of current study indicated that all patients presented normal levels of renal functions. However on comparison of the results at entering with at recovery it was observed significant differences ($p<0.01$). Patients with abnormal liver tests were at increased risk of progressing to severe disease. The detrimental effects on liverinjury mainly related to certain medications used during hospitalization,and should be monitored and evaluated frequently[18].

Conclusion

Elevated levels of alanine aminotransferase (ALT) was observed in 10% and of aspartate aminotransferase (AST) was observed in 40% of patients with COVID 19,yet on comparison of the results at entering with at recovery it was observed significant differences ($p<0.01$) of all patients. As AST is not specific for liver damage, which indicated that the systemic inflammation induced by the virus might be responsible for these findings not related to certain medication.

Implementation of Cross-Sectoral Collaboration in the Leptospirosis Control in Jeneponto Regency: A Qualitative Approach

Syamsuar Manyullei[1], Muh. Fajaruddin Natsir[2], Wirdayanti[3]

[1]Assitant Professor at the Environmental Health Department,Public Health Faculty, Hasanuddin University, [2]Instructor at the Environmental Health Department,Public Health Faculty, Hasanuddin University, [3]Research Scholarat the Environmental Health Department,Public Health Faculty, Hasanuddin University

Abstract

Background: Leptospirosis is an infectious disease caused by leptospira sp. and many are found in populations of people who live in rural areas. Leptospirosis is also a zoonotic disease that can be endemic and has adverse economic, social and psychological impacts. Zoonotic disease is closely related to human health, animals, and also the environment so that in controlling and preventing it is necessary to have the involvement or cooperation of various parties absolutely.

Objectives: This study aims to determine cross-sectoral partnership through coordination, communication, and collaboration in the context of controlling leptospirosis in Jeneponto Regency.

Method: This study is a qualitative study with a phenomenological design. The number of informants in this study were 14 people. Determination of informants obtained by purposive sampling by determining the criteria of informants who are willing to be interviewed and play an important role in controlling infectious diseases.

Results: The findings of this study showed that communication and collaboration during the control of infectious diseases such as leptospirosis in Jeneponto Regency had been carried out well through a workshop conducted by the *puskesmas* by inviting other sectors. However, there are obstacles when coordinating that health workers sometimes forget to coordinate with the sectors involved to secure the community. So that the sector is too late to take action when cases occur in the community.

Conclusion: Implementation of cross-sectoral collaboration in controlling leptospirosis has been carried out with good communication and collaboration.

Suggestions: Health workers need to improve their coordination with all sectors in Jeneponto in order to get better leptospirosis control.

Introduction

Leptospirosis is a zoonotic disease that is potentially fatal causing endemic in various regions of tropical climates and causing epidemics after heavy rains and floods. This infection results from direct or indirect exposure to infected animals carrying pathogens in their kidney tubules and releasing pathogenic leptospires through urine.[1] Leptospirosis is an incidental event because the most common host is mouse.[14] Although many other animals can be used as hosts reservoir, but Rattus norvegicus is the most common source of human infection infected by leptospira bacteria.[1]

Leptospirosis is also commonly called Weil disease.[2] This disease is spread through urine or blood of animals infected with leptospira bacteria or attack humans through direct contact with water or soil that

has been contaminated with urine of animals carrying leptospira bacteria.[3] Risk factors in transmission of diseases transmitted by mice to humans is a factor in environmental conditions as rat habitat.[4]

The International Report of the Leptospirosis Society (ILS) states that Indonesia as one of the tropical countries with relatively high cases of leptospirosis deaths, ranging from 2.5% - 16.45% or 7.1% on average and including the third highest ranking in the world for mortality.[2] This can be seen in cases of deaths due to leptospirosis in 2015 - 2018 continues to increase. The highest mortality rate is in 2018 which is 148 deaths.[5,6]

Data on leptospirosis cases in South Sulawesi Province in 2016 - 2018 were not found.6 However, if we look at the risk factors for leptospirosis transmission, namely the high rat population that has the potential to infect humans through leptospira bacteria, an intervention is needed to prevent the emergence of leptospirosis cases in the region. Based on the Minister of Health's Regulation Number 50 Year 2017 concerning Environmental Health Standard Quality Standards and Health Requirements for Vectors and Animal Disease Carriers and Control states that when the number of rats in the environment exceeds the quality standard value, it is necessary to control. The standard quality value for mice is <1.[7]

South Sulawesi Province has found two mice that were positive for leptospira bacteria from seven rat samples that had been examined. The results were obtained from study on the identification of the presence of leptospira serovar bacteria in rat blood serum at Sultan Hasanuddin International Airport.[8] Whereas areas in South Sulawesi that are at high risk of being contaminated by leptospira bacteria are caused by environmental aspects. The intended environmental aspects are the use of surface water sources and the physical quality of river water that does not meet health requirements.[9]

Based on information from Buludoang Community Health Center surveillance officers in Tuju Village, Bangkala Barat District, Jeneponto Regency in 2019, stated that from the tens of rats that had been examined, two rats were found positive for leptospira bacteria. One of the causes of the discovery of these bacteria is the condition of environmental sanitation that still does not meet health requirements. This can be seen from the achievement of the percentage of healthy homes in 2016 of only 48.57%, and the percentage is categorized as the lowest percentage.[10] For this reason, an intervention is needed to overcome this problem in the form of health risk interventions. Health risk based interventions can be carried out through integration and synergy of activities across programs and across sectors. Cross-sectoral or other stakeholder cooperation is useful for overcoming the types of disease problems that involve complex interactions between humans, animals and the environment.[11] Cross-sectoral cooperation or other stakeholders are recommended to be useful for overcoming the types of disease problems that involve interactions complex between humans, animals and the environment.

Health risk-based interventions can be carried out through integration and synergy between cross-program and cross-sector activities. One health is a concept that involves three main elements, namely humans, animals and the environment. So that in the process of applying this concept, it needs to include multidisciplinary collaborations in science related to health, social, economics, human ecology, animal health and biology and environmental sciences.

The application of the concept of one health really requires a good communication, coordination and collaboration in controlling a disease. The importance of coordinated communication in the dissemination of information is the key to successful implementation of one health. In conveying information including standards and objectives of the policy requires the delivery of accurate information to the implementers and must be consistent from various sources of information. Communication within and between organizations is a complex and complicated process. [18]

Cross-sectoral cooperation in overcoming the problem of leptospirosis is very important to see the case of leptospirosis which is still a problem in Indonesia. That is because environmental sanitation that still does not meet health requirements is one of the risk factors for the presence of mice. The study objective of researchers is to find out how the implementation of cross-sectoral cooperation in the context of controlling leptospirosis in Jeneponto Regency. This study can also be used as a reference for stakeholders to collaborate more in controlling leptospirosis. For this reason, researchers are interested in studying the implementation of cross-sectoral cooperation in the context of controlling leptospirosis. The results of the study are expected

to provide useful information for cooperation in the prevention and control of leptospirosis, especially in Jeneponto Regency

Method

This study was conducted on January 23 - 31, 2020 at Buludoang Health Center, Tuju Village, West Bangkala District, Jeneponto Regency. This study is a qualitative study with a phenomenological design. The number of informants in this study were 14 people consisting of stakeholders from the health sector and other sectors who played an important role in controlling leptospirosis. Determination of the informants obtained using purposive sampling method, where the informants obtained by determining certain criteria in accordance with the objectives of the study.

Data were collected by extracting data from various techniques and sources to clarify information in the field. This primary data was obtained by observation and in-depth interviews (indepth interview) and Focus Group Discussion (FGD). Data obtained from in-depth interviews and Focus Group Discussions (FGD) were carried out manually in accordance with the instructions for qualitative data processing, as well as in accordance with the objectives of this study. Furthermore, the data were analyzed by the thematic analysis method, and interpreted and presented in narrative form.

Results

Based on information obtained from the results of in-depth interviews and Focus Group Discussion (FGD) on several informants regarding the implementation of cross-sectoral cooperation that has been carried out in Jeneponto District, it was found that the implementation of cross-sectoral cooperation by looking at coordination, communication, and collaboration in controlling infectious diseases (leptospirosis) is indispensable. Cross-sector implementation is needed when new events occur in the community. Based on study that has been done, the results obtained are that most informants said communication was important in cross-sectoral cooperation. This can be seen from the following in-depth interview from non-health sector informants:

"*Yes, important. Information is obtained from the bottom up or from the level of puskesmas to district. For example, the case of infectious disease that occurred yesterday we made communication so that cross-sector collaboration was effective like yesterday*" (Mr1, 49)

This answer was suupported by the answers of other informants from the following health worker:

"*Yes ... very important. Because we cannot work individually. In cross-sectoral cooperation, each has a role and they move to influence society because we cannot do it alone. We work together so that communication is very important to be carried out in order to be successful in controlling disease*" (HW1, 35)

Whereas study that has been carried out regarding information feedback submitted by health workers in controlling infectious diseases was obtained that cross-sectoral responds well when cases occur. This is evidenced by the following in-depth interview interview from informants:

"*When I got the information that a case like this had happened, we immediately went down to help. For example, yesterday we were directly contacted by health workers to provide security to the public against cases that were happening*" (Mr2, 44)

This answer was reinforced by one of the following in-depth interview information from the health officer:

"*Yes they immediately respond ji and they immediately go down. We go down the field and they help*" (HW3, 27)

Based on study that has been done regarding communication barriers in cross-sectoral collaboration in Jeneponto District, it was found that there were no barriers to each informant interviewed. This is evidenced from the following in-depth interview with the health worker informant:

"*There are no obstacles during cross-sector collaboration*" (HW5, 34)

"*Obstacle is almost said to be non-existent, because my superiors immediately carry out instructions to all relevant sectors for handling. So all communication depends on the highest leadership. The highest leadership determines what to do*" (HW4, 51)

This answer was strengthened by the answer of one of the cross-sectoral informants during an in-depth interview. The following excerpts are related to communication barriers in cross-sectoral cooperation in Jeneponto Regency:

"*there are no obstacles and it has been running from a few years ago*" (Mr5, 56)

Based on study that has been done related to the importance of cross-sector collaboration it was found that the majority of informants considered collaboration important in cross-sectoral collaboration in Jeneponto Regency. This can be seen from the following Focus Group Discussion (FGD) informants from health workers:

"*Yes, important. It was related to cross-sector anyway. That all must come along. For example, from health alone, it can't be. There must be cross-sectoral, such as from the sub-district office, the village head to move the community*" (HW5, 34)

This answer was supported by the answers of other health workers at the Focus Group Discussion (FGD) which said that cooperation could facilitate disease control. The following is an excerpt from the health worker informant's answer:

"*They all work together in accordance with their respective main tasks. Cross-sectoral collaboration starting from villages, sub-district heads, and districts continues to collaborate so that controlling an illness is easy to do*" (HW4, 51)

"*We work together to control a disease. Especially cadres must always be diligent in monitoring the conditions that are happening in the community. All are responsible both the village head and the village head towards the community environment*"(HW9, 38)

The findings were obtained that there were no obstacles in coordination in cross-sectoral cooperation in Jeneponto Regency. The results are proven from the following excerpts from the answers of the health workers during an in-depth interview:

"*There are no obstacles in coordinating across these sectors because our communication has also been smooth so far*" (W6, 40)

The informants' answers were strengthened by the answers from other sector's informants during the FGD. The following is an excerpt from the informant's answer:

"*No obstacle so far*" (Mr1, 49)

But rather than that, for this point one of the informants answered that there were obstacles in cross-sectoral coordination in Jeneponto Regency. This is evidenced from the excerpts from the informants' answers during FGD as follow:

"When there was a case yesterday, there was a problem in handling the community because of delays from the village security. We are also overwhelmed by social tasks" (Mr5, 56)

These answers were reinforced by the following misinformation answers during in-depth interviews:

"*One obstacle that sometimes occurs is when he (health worker) does not coordinate with us who should contribute to protecting the community. Sometimes if something has happened and I just found out, then I will still be there to help to give direction to the community*" (Mr4, 37)

But rather than that, for this point one of the informants provided input during an in-depth interview that could be used as advice in the future, the informant said that

"*if you want to coordinate the road, one of them is to improve communication between fellow health workers and other sectors involved in control*" (HW5, 34)

The findings of study related to the implementation of cross-sector collaboration in Jeneponto can be seen from the quotation of the answer from one of the following health informants during an in-depth interview:

"*Maintaining the existing ones and if there is anything that needs to be improved, improve it, because it is very important to do it*" (HW4, 51)

The informant's answer was strengthened by the answer of one of the informants during the FGD. The informant said that

"*Hopefully in the future every month cross-sector will be implemented. Because this cross-sector is only done every quarter. So hopefully it can be implemented every month*" (Mr1, 49)

Then for this point, the informant hopes to always confirm if a case occurs. This can be seen from the excerpts from the cross-sectoral informants' answers during in-depth interviews. The informant said that:

"*I hope that in the future if something happens like this, please confirm with us*" (Mr4, 37)

Discussion

Analysis of the data in this study can illustrate the implementation of cross-sectoral cooperation in

the context of controlling leptospirosis in Jeneponto Regency by observing communication, collaboration, and coordination between health workers and related sectors. Leptospirosis control in Jeneponto Regency does not have a special program in handling the disease, but it is associated with controlling infectious diseases. Leptospirosis control in Jeneponto Regency is only done when the results are found during an outbreak.

The direct effect between communication on the implementation of cross-sector collaboration was proven in the study of Hasibuan et al (2016) when analyzing the implementation of the Dengue Fever Disease Control (P2DBD) program in the Medan region. Even his study concluded that communication directly affected the implementation of the P2DBD program. So in line with that, several things make it clear that communication in cross-sectoral collaboration in Jeneponto Regency is the holding of a workshop every three months conducted by the puskesmas by inviting other sectors. With the frequent implementation of the community service program related to problems that are occurring in the community environment, all program implementers understand the purpose, instructions, and series of activities in controlling leptospirosis.Based on the results of in-depth interviews and FGDs from several informants it was found that collaboration in controlling infectious diseases has been established. This is indicated by the statements of several informants about the importance of cross-sector collaboration. The informant considers that when collaboration does not work well, problems that are happening in the community will be difficult to solve. This is in line with the main principles of collaboration, namely the transparency of the process and the involvement of all stakeholders in making a policy. The aspect of collaboration is dialogue, building commitment, goals, and mutual agreement.

Cross-sector involvement in controlling leptospirosis is one of the ways that must be properly maintained and improved. Sectors involved in controlling leptospirosis are the Ministry of Health who plays a role in interventions related to public health and the Ministry of Agriculture that is needed in efforts to control animals or reservoirs carrying disease. In this case, rats are the main reservoir for leptospirosis transmission. However, in this study the researchers did not include the Agriculture Service as an informant because it did not meet the criteria determined by the researcher, namely the presence in the FGD.

Early diagnosis of leptospirosis is needed to reduce the number of patients dying. Health workers in each region need to have a good ability to recognize the epidemiology of leptospirosis in order to be able to make early detection, management and appropriate prevention method to deal with the incidence of leptospirosis around them. Control of leptospirosis also cannot be completed by the health sector but collaboration and coordination between sectors is needed.[19]

Good coordination must be based on cooperation (between the central government, between the central and regional governments, and between regional governments) and mutual understanding by promoting the spirit of equality. So that in carrying out the tasks to deal with Extraordinary Events (EE) or zoonotic diseases are encouraged to optimize the utilization of resources in their respective institutions and encourage integration. Coordination will run continuously if there is mutual trust between institutions and always maintain the trust that has grown. Trust will grow if the commitment to the agreed duties and responsibilities. With the commitment, consistency, and professional in carrying out the tasks, the integrity of the 'group' coordination will go well.[12]Based on the results of study conducted at the Buludoang Health Center, Tuju Village, West Bangkala District, Jeneponto Regency, it was found that coordination of health informants and other sectors has been carried out. Cross-sectoral and cross-program coordination such as village heads and community leaders who play an active role in mobilizing the community and its members in controlling leptospirosis. For example, each puskesmas activity must have permission from the regional stakeholders, because the regional stakeholders act as the owner of the area for licensing in every activity that will be carried out by the Puskesmas or the Health Office. The puskesmas cooperates with cadres who function as a channel of information between the puskesmas and the general public.[13]

Based on the results of this study, the informant began to understand the importance of coordination in controlling infectious diseases in the community. Cross sector involvement in controlling leptospirosis is carried out through monitoring by the District Health Office as the highest holder in decision making related to efforts to implement leptospirosis control in the region. In this study, the informant also explained that coordination is indeed needed by humans or organizations to achieve the goals together.

The results of the study explained that in carrying out cross-sectoral collaboration, stakeholders have

been given their respective responsibilities to carry out their respective tasks and functions. Some informants explained that in coordinating with other sectors in handling a case a whatsapp group was made to facilitate communication so that coordination was carried out well. So that in controlling leptospirosis or other diseases that are endemic in the community environment can be resolved quickly and accurately.

Conclusions

Based on the results of study that has been carried out on the implementation of cross-sectoral cooperation in the context of controlling leptospirosis in Jeneponto Regency, the researcher draws the conclusion that cross-sectoral collaboration that has been carried out so far still needs to be improved. Considering the results of in-depth interviews that have been conducted, the informant said that coordination in cross-sectoral cooperation still needs to be well coordinated with the sectors that should be involved in disease control. However, this information is different from the answers of the informants in the FGD which said that the coordination that had been carried out so far needed to be maintained, bearing in mind that the handling of cases that had occurred in Jeneponto Regency had been well coordinated by the sectors involved in the control. It is suggested for stakeholders to improve coordination by always conducting cross-sector workshops every month to evaluate the results of work that has been carried out and the things that need to be improved through coordination.

Ethical Clearance: The study obtained ethics approval from the Health Research Ethics Committee of Public Health Faculty, Hasanuddin University.

Impact of Quality of Healthcare Services on Consumer's Satisfaction at Primary Healthcare Centers

Tariq Yassen Taha[1], Wissam Jabbar Qassim[2]

[1]PhD(c), Research Scholar, University of Baghdad, College of Nursing, [2]Assistant Professor (PhD), University of Baghdad,College of Nursing, Community Health Nursing Department

Abstract

Background: Current trend in quality healthcare services is to work toward providing 'people-centered', healthcare that puts the consumers at the center in the health delivery system. This study aims to determine the level of quality of healthcare services in primary healthcare centers.

Method: The study included a simple random sample of (180) health and medical care providers in primary healthcare centers in Baghdad City by (5-8) healthcare providers for each center.

The study results showed that the general evaluation of the quality of primary healthcare services is highly efficient and that the result has a significant impact on the beneficiaries' satisfaction.

Conclusion: The researchers concluded that the primary healthcare centers are not commensurate with the increasing population density, and the lack of an ambulance in most of the primary healthcare centers. Furthermore, the level of confidence in our health institutions regarding service efficiency indicates a high level.

Keywords: *Quality of Healthcare Services; Consumer's Satisfaction; Primary Healthcare Centers.*

Introduction

Current trend in quality healthcare services is to work toward providing 'people-centered', healthcare that puts the consumers at the center in the health delivery system. This means that consumers' views and evaluation of services provided are critical in providing feedback for improving the quality of care provided [(1)]. Quality is directly connected with meeting requirements, expectations, and needs of customers. Whether a service will be reused also depends on adequate quality, especially nowadays, when production processes are of approximate and high quality. In such conditions, proper and perfect execution of logistics services can have a crucial impact on its reuse. It is important to strive constantly for higher goals and their achievements. It requires also an adequate methodology that can help improve the quality measurement of logistics services[(2)].

Service quality is generally finding of services given to consumers. It depends on the customer judgment. The comparison of expectations next and previous used services is the result of service quality and identifies procedure of the service transfer is known service quality perception[(1)].

It is also service quality dimension until SERVQUAL (service quality) model;measures do not contemplate it as. Extensive perspective, human perspectives and its origination also service quality measures as these restrictions[(3)].

Method

A descriptive study was conducted at Primary Healthcare in Baghdad City from January 13th, to March

Corresponding Author:

5th, 2019. The study included a simple random sample of (180) healthcare providers in primary healthcare centers in Baghdad City (5-8) healthcare providers for each center using a questionnaire for the quality of services and using the method of distributing questionnaires to the various specialties working in the health center, these centers are distributed into (2) sides and divided into (8) health sectors according to ministry of health directorate of primary healthcare. A total of (28) primary healthcare centers are selected for the purpose of the study.

The data collection starts with providers primary healthcare services in primary healthcare centers in Baghdad City using a questionnaire and the interview technique as means of data collection.

The reliability of the questionnaire was determined through a pilot study and the validity are achieved through a panel of (17) experts. A pilot study included a convenient sample of (17) provider were selected among persons concerned with primary healthcare centers.

Results and Discussion

Table 1. Overallevaluation of healthcare system and structure (N=28)

Evaluation	f	%	M.S	SD
Inefficient	0	0	2.79	0.418
Efficient	6	21.4		
Highly efficient	22	78.6		
Total	**28**	**100**		

f: Frequency, %: Percentage, M.S: Mean of score, SD: Standard Deviation
Inefficient= 0-8, Efficient= 9-17, Highly efficient= 18-26

More of centers are highly efficient (78.6%) and (21.4%) are showing efficient system and structure.

More than a third of healthcaregivers age 50-59-years (35%), morethan a half are females (53.9%), less than a half hold a bachelor's degree (48.3%) and diploma (33.9%). It has known of specialty variable that (39.4%) were physicians, (22.9%) nurses, and the remaining percentage was distributed on other specialties such as: radial photographer, biologist, chemist, pharmacist, medical technician, and vital statistician. Those healthcaregivers are reported that they are working for more than 21-years at the primary healthcare (45.6%) as years of experience.

Table 3. Evaluation the tangibility of primary healthcare services at primary healthcare centers (N=180)

List	Tangibility items	M.S	Evaluation
1	The health center needs to appliances, medical equipment and supplies used currently occur.	2.53	High
2	You believe that the nature of galleries and places waiting of the consumers', the doctors' offices and the current employees fit with what you expect in your mind.	1.92	Moderate
3	There is interest by the health center management and employees in a manner and body work clothes commensurate with the level of service provided.	2.60	High
4	You believe that the management of the health center provided the material requirements within the available capabilities and commensurate with your mental expectations for it.	2.51	High
Total		**2.39**	**High**

M.S: Mean of score, Low= 1 -1.66, Moderate= 1.67-2.33, High= 2.34-3

Primary healthcare centers having high tangibility (M.S= 2.39) as seen in scores of mean that associated with all items except the item (2) that refer to moderate. That mean most of healthcare centers are having enough equipment and supplies in addition to the appropriate staff that fit to mission of these centers.

Table 4. Evaluation the reliability of primary healthcare services at primary healthcare centers (N=180)

List	Reliability items	M.S	Evaluation
1	The Health Center's management is 9 committed to ensuring that patients and consumers' provide health and therapeutic services and provide the appropriate environment as you would expect in your mind.	2.65	High
2	The health center management sympathizes with patients and consumers' when submitting complaints as you expect them	2.82	High
3	The health center management is seen to provide services on time, in a fast and accurate manner.	2.77	High
4	Patients and consumer's place their trust in the medical and health professional skills with confidence and safety.	2.66	High
5	The health center's management is seen to record information about patients and consumer's and their health status in records and computers.	2.76	High
Total		**2.73**	**High**

M.S: Mean of score, Low= 1 -1.66, Moderate= 1.67-2.33, High= 2.34-3

Primary healthcare centers are high reliable (M.S= 2.73), the mean of scores is showing high in all items that indicate a good quality of services related to reliability that represented by: primary healthcare centers are providing a therapeutic and appropriate environment for their consumers, responding to any complaints that committed to centers, providing a services in accurate time and manner, keep that trust between the consumers and staff, and working with documentation of information regarding the consumers.

Table 5. Evaluation the responsiveness of primary healthcare services at primary healthcare centers (N=180)

List	Responsiveness items	M.S	Evaluation
1	It is telling patients and consumer's for times the provision of health, medical and therapeutic service to them according to your perception.	2.74	High
2	It is not expected to get patient's and consumer's on the online service by the staff at the health center.	1.98	Moderate
3	The health center staff wants to help patients and visitors permanently.	2.82	High
4	Despite the busy staff to provide services, but they respond with patients and consumer's requests immediately.	2.82	High
Total		**2.59**	**High**

M.S: Mean of score, Low= 1 -1.66, Moderate= 1.67-2.33, High= 2.34-3

Primary healthcare centers are showing high responsiveness (M.S= 2.59) as seen in scores of mean that associated with all items except the item (2) that refer to moderate. That mean most of healthcare centers are working on telling the consumers the time of service availability, providing the expected services that meet for consumers' perception, and responding to consumers' requests immediately.

Table 6. Evaluation the assurance of primary healthcare services at primary healthcare centers (N=180)

List	Assurance items	M.S	Evaluation
1	In your opinion, patients and consumer's should have full confidence in the health center staff.	2.85	High
2	In your opinion, you should reassure the patient and the consumer's that he is in good hands with the staff at the health center when dealing.	2.94	High
3	Do you feel that the medical and health staff and staff interact with patients and consumer's and treat them gently and tactfully.	2.74	High
4	The staff of the health center have the competence, the Courteous and the credibility to perform their work, which necessitates the management of the health center to provide support to these workers.	2.74	High
Total		**2.82**	**High**

M.S: Mean of score, Low= 1 -1.66, Moderate= 1.67-2.33, High= 2.34-3

Primary healthcare centers are providing high assurance (M.S= 2.82), the mean of scores is showing high in all items that indicate a good quality of services related to assurance that represented by the opinion of healthcare providers about the mission and vision of the primary healthcare that working in, it has known of findings that high confidence and opinion are expressed about the work of primary healthcare services.

Discussion

The evaluation of the structure of elements and systems in primary healthcare centers, with an average of more than 75% of the total item as good average scores in more elements. It reflects the availability of standard criteria for the system and the structure represented and device availability, complaints boxes, and wheelchair availability.

These results are consistent with the findings of[4] who indicated that all of the above are available in 85% of primary Healthcare centers.

The Environmental Protection Agency(EPA) requirement for medical waste disposal are for waste to be segregated into categories of, sharps, toxic, hazardous, regulated or infectious fluids of greater than 20 ml. and other materials. Although incineration has long been recognized as an efficient method for disposing safely of sharps and other contaminated medical waste[5].

While, the coverage area of the population through the services of the healthcare center, two primary healthcare centers provide healthcare services to less than (20,000) consumers. While, 26 primary healthcare centers of these coverage are equal to or more than (20,000). These results show that all primary healthcare centers have violated international standards (2-3 per 10,000) (Ministry of Health) regarding their coverage. This may be due to the difference in population size between the health sectors in Baghdad. Community health can be affected by the size of the population, so knowing the size of the community provides community health workers with important planning information [5].

Concerning the presence of an ambulance in the primary healthcare centers, the results indicate that more than (89%) of the primary healthcare centers do not have an ambulance, and these results are consistent with thatof[6]who stated that the availability of an ambulance in primary healthcare centers at (17%), and these results do not comply with international standards in the quality of primary healthcare services.

Regarding the evaluation of tangibility in the field of quality of healthcare services, the results indicate that primary healthcare centers with high tangibility as seen in mean of scores that associated with all items except the item (2) that refer to moderate. That mean most of healthcare centers are having enough equipment and supplies in addition to the appropriate staff that fit to mission of these centers.

The results are consistent with a study conducted by (7) (2012) in Iran who concluded that the tangibility dimension in the quality of primary healthcare centers services was high, and that is consistent with the good reputation and excellence that the care system craves Primary health in Iran, where reached.

The tangibility dimension indicates the appearance of the facilities, physical and human equipment at the health service delivery site with respect to (22) regarding the tangibility of the services in terms of availability of

equipment and materials Means of education and the outward appearance of workers [8].

Regarding the reliability evaluation in the quality of healthcare services, the results revealed that primary healthcare centers are highly reliability, the average score appears in all elements indicating good quality of the services related to the reliability it represents: primary healthcare centers are providing a therapeutic and appropriate environment for their consumers, responding to any complaints that committed to centers, providing a services in accurate time and manner, keep that trust between the consumers and staff, and working with documentation of information regarding the consumers. This corresponds to the good reputation of our health institutions for their services to make the level of high trust and applies to international standards to service quality.

This result is consistent with that of [9]who indicated the positive effect of the application of reliability dimension in the evaluation of primary healthcare providers in healthcare centers.

Whereas, reliability means the ability to provide services on time and with the required accuracy, the extent of fulfillment of obligations, and the performance of health services promised by beneficiaries. It also includes adherence to the deadlines set for beneficiaries (patients) as well as seeking to preserve their files and documents from damage and loss [10].

For the responsiveness and the quality of healthcare services, the results indicate that the primary healthcare centers show a high response as they appear in the average scores associated with all elements except for item (2) that indicates moderate. This means that most healthcare centers inform consumers when the service is available, and provide expected services that meet consumers' perceptions, and respond to consumer demands immediately, and this is felt in the tangibility analysis table, With this result, can say that the primary healthcare centers implement international standards of quality of services at a high level with regard to the responsiveness dimension.These results are consistent with the study of [11] whostated that the response was high.

Concerning the responsiveness that is the ability and desire of the health center provider services to the beneficiaries at the time and meet [12] to provide them appropriate to the current, future and urgent needs of patients through flexibility in procedures and means of providing services [13]. and willingness and permanent desire to provide services to patients when they need them [14].

Regarding the assurance evaluation and the quality of healthcare services; the results showed that primary healthcare centers offer a high assurance, the average score appears in all elements indicating good quality of services related to assertion represented in the opinion of healthcare providers in Mission and vision for primary healthcare that you work in.

These results are consistent with a study conducted in United Kingdom by (20). The levels of awareness of both patients and staff on the levels of application of the dimensions of the quality of services provided in outpatient clinics and healthcare centers. The study concluded that the evaluation of workers and patients' quality dimension application levels were high for the assurance dimension.

Regarding the meaning of assurance, it means the quality of information and the policy of those responsible for providing services and their policy, and their ability to inspire confidence and respond to patient and customer inquiries. It also indicates the confidence of patients in the health center staff, and the ability of those responsible for managing the health center to provide safety and security at the place of service [15].

Primary healthcare centers showed a high degree of empathy and mean the average scores in all items that indicate a good quality of services related to empathy, which is: giving health services with appropriate attention to consumers, and providing health according to the needs of consumers, The evaluation of empathy to this high degree It does not come out of the void, but thanks to the concerted efforts of primary healthcare providers, it gave an important impression to auditors and reached international standards for quality of services.

The results of this dimension are consistent with thatof [16]in Sao Paulo, and the features that have reached the highest levels of satisfaction are compatible with the education and commitment of the medical and nursing staff, interpretations and instructions on the user's health problem, respect for privacy and guidance for continuing care after discharge from the hospital. Empathy were the dimension that affected satisfaction, as they demonstrated a high degree of empathy.

Referring to the sympathy dimension as it includes many variables that include the interest and care of workers who benefit from the services personally, and understanding and realizing their needs and the appropriateness of working hours and providing services in a way that suits the desires patients [17].

Conflict of Interest: The researchers confirm that there is no any conflict of interest.

Source of Funding: This study is self-funded.

Ethical Clearance: The researchers obtained the ethical approval from the University of Baghdad, College of Nursing.

Conclusion

1. Primary healthcare centers whose numbers are not commensurate with the increasing population density, as the number of people included in the geographical area exceeds 20,000 for the main health center, and this violates the international standards for the quality of services, which stipulates that no more than 10,000 people.
2. The level of confidence in our health institutions regarding service efficiency indicates a high level, and this is high consistent with international standards for service quality.
3. An indication the evaluation of the healthcare system and structure in the primary healthcare centers, that the Criteria of the existence of a lecture hall at the health center, the evaluation (fair).

Recommendations:

There is a need to:

1. Increase the number of primary healthcare centers to fit the increasing population so that it does not exceed 10,000 people until it conforms to international standards for the quality of services.
2. Provide all primary healthcare centers with an ambulance to transport patients and critical cases to the nearest hospital.
3. Maintain the high level of confidence in our health institutions by developing the health sector with all new scientific and material capabilities to enhance the level of workers in primary healthcare centers to ensure the continued quality of healthcare services.

Abstract

This review aimed to explore the relationship between risk behaviors and drug abuse in adolescents. This review was reported according to PRISMA guidelines (Selected Reporting Items for Systematic Review). A review protocol was developed to identify all articles published investigating the relationship between Adolescent Risk Behavior and Drug Abuse. Relationship between risk behavior and drug abuse among adolescents; some studies measured the risk behaviors of adolescent drug users. Other studies intervened to prevent risk behaviors in adolescents related to drug abuse. At the same time, some studies found no significant relationship between drug-related behavior and drug abuse. Limitations on methodology are significant in organizing the literature to see connections. This review concludes that all deviant behavior is highly risky for adolescent health. Attitudes toward risk behavior refer to adolescents' perception of vulnerability to the possible negative consequences of unsafe behavior.

Keywords: *Risk Behavior; Drug Abuse; systematic literature review; Adolescents.*

Introduction

Given the high prevalence of drug abuse among adolescents[1,2], many studies support to prevent risky behavior of adolescents in preventing risky behavior in drug abuse[3–7]. Depression and school environment factors most influence drug users among adolescents. In contrast, psychological and peer environment factors become pivotal domains to be targeted in programs to prevent drug use in adolescents.[8–12] Targeting adolescents is crucial because early on, they can build their intention not to behave riskily about drug abuse[13,14] The role of family, peers, school, and community is very supportive in preventing risky behavior in adolescents. Risk behavior prevention programs that target early teens in social contexts can also equip their knowledge and skills to avoid risky behavior. In this way, adolescents may need a more integrated approach to prevention that targets various adolescent life settings from multiple forms of risk behavior.[15]

Risk behavior is controlled intentionally or unintentionally to the perceived uncertainty about how the results will be in the future. Risk-taking behavior can be said to be voluntary behavior that is not socially acceptable with potentially harmful effects because precautions are not taken, such as drug abuse[16]. in Theory of Planned Behavior that a positive attitude

that needs to be fostered through the perspective of perception of behavioral control to produce intentions in positive behavior, in this case, prevents him from using drugs (Ajzen, 1991).

This study focuses on adolescents aged less than 20 years as subjects in this study. Various damage caused to adolescents who consume drugs, not only physical but mental, social, their future is at stake. For this reason, this review aimed to explore the relationship between risk behaviors towards drug abuse in adolescents.

Method

This review was reported according to PRISMA guidelines (http://www.prisma-statment.org) Selected Reporting Items for Systematic Review). A review protocol was developed to identify all articles published that investigate the relationship between Adolescent Risk Behavior and Drug Use. The following search terms were used: *((“adolescent”[MeSH Terms] OR “adolescent”[All Fields]) AND (“risk behaviour”[All Fields] OR “risk-taking”[MeSH Terms] OR “risk-taking”[All Fields] OR (“risk”[All Fields] AND “behavior”[All Fields]) OR “risk behavior”[All Fields]) AND (“substance-related disorders”[MeSH Terms] OR (“substance-related”[All Fields] AND “disorders”[All Fields]) OR “substance-related disorders”[All Fields] OR (“drug”[All Fields] AND “abuse”[All Fields]) OR “drug abuse”[All Fields])) AND (Journal Article[ptyp] AND “loattrfree full text”[sb] AND “2009/12/15”[PDat] : “2019/12/12”[PDat]) AND ((Journal Article[ptyp] OR Observational Study[ptyp]) AND “loattrfree full text”[sb] AND “2009/12/15”[PDat] : “2019/12/12”[PDat].*

Search strategy and data sources: There were three steps to find articles in this study. The first step was with the help of research librarians. A search was then done through the Web of Science, Pubmed, and the Scopus database to analyze text words in titles, abstracts, and keywords in the last ten years (2009-2019). After this analysis, the final keywords related to Adolescent Risk Behavior and Drug Abuse were chosen, and a search strategy was developed through the relevant database. The second step was an electronic search carried out with a search strategy through 8 electronic bibliographic databases, namely: PubMed, ScienceDirect, Scopus, ProQuest Central, SAGE journal, Emerald Fulltext, EBSCOhost, Web of Science. The search conducted for 1 Month (November 2019). And Third, all relevant references cited in the article were to look for additional related studies manually. All items that had been downloaded were stored in Mendeley’s Software. Duplicate reports were excluded, titles and abstracts of all reviews go through a peer-review process. The author checked whether the article included full text or not. After carrying out these steps, the authors examined using the inclusion criteria for the relevance of the item.

Inclusion Criteria: The article was chosen when analyzing the relationship between adolescent risk behavior and drug abuse; use quantitative methodology; adolescents less than 20 years old, available (full text) in English. The age category was chosen based on the adolescent’s definition of psychosocial development[18].

Data Extraction: First, a summary table was developed and tested by the author. Then, a summary table, as well as the full text of the selected article, and data extracted manually. Data obtained were article title, year, author, research arrangement, research design, research participant characteristics, measurement of risk behavior in drug abuse in adolescents.

Data Analysis: Data extracted and analyzed were performed narratively. Meta-analysis was not done in this study.

Results

Articles found in the initial search contained 109 items based on keywords that have been described in the method section. Thirty-three articles were excluded because of the duplication; 76 materials were included in the screening stage. Items that were complete and deemed worthy were 25. Then 12 articles were excluded, with the reason the results are not relevant. Then 13 reports that met the requirements for review.

Table 1. Summary of the included studies' findings and authors' conclusions.

No	Reference	Results	Authors' conclusions
1	(Heger et al., 2014)[19]	Most risk behaviors tend to be associated with increased depressive symptoms in adolescent-related drug abuse and found no significant impact on depressive symptoms of adolescents.	Future studies are recommended to explore the relationship between depression and risk behavior in adolescents.
2	(Wojtyla-Buciora et al., 2017) [20]	Increased drug use among adolescents in 2009-2011, more specifically those in secondary school.	Teenagers do not have enough knowledge about the dangers of drugs. In facing the growing threat of drug trafficking, prevention efforts in health education are needed.
3	(Ammerman, Steinberg and McCloskey, 2018)[21]	Risky behavior is significantly relevant to their suicide ideas.	This finding has implications for prevention and intervention programs for adolescents
4	(Browning, Soller and Jackson, 2015)[22]	Strengthening with the environment shows a strong negative relationship with drug use in adolescents	The importance of eliminating routines that are often done in adolescent health and behavior.
5	(Keyes et al., 2015)[23]	The results of this study found that the magnitude of the relationship between risk behavior and drug use.	The importance of putting risk behavior in a framework to prevent drug users.
6	(Kellam et al., 2014)[24]	Reduced high-risk behavior and drug abuse in men who are in first grade and junior high school are more influential.	Interventions through classroom-based prevention can reduce risky behavior in drug abuse.
7	(Dougherty et al., 2015)[25]	All adolescents have relatively stable delays over time in increased risk-taking.	Adolescents in risk-taking can contribute to increasing their motivation for drug prevention in adolescents.
8	(Zebrak and Green, 2017)[26]	Drug users among adolescents have increased risk behaviors.	For further research to explore more on the social aspects by linking drug use and risk behavior.
9	(Yu et al., 2017)[27]	Some adolescents retain their personalities from time to time, but they are more likely to change risky behaviors.	The need for prevention programs through interventions that are integrated and specifically designed to prevent risky behavior towards drug abuse in adolescents.
10	(Cordova et al., 2018)[28]	Teenagers mostly accept storytelling Empowerment interventions.	It is hoped that further research will be able to link interventions carried out with risk behaviors.
11	(Gart and Kelly, 2015)[29]	The results of this study show a statistically significant effect between adolescent risk factors for suicide resulting from drug use in adolescents.	Illegal drug use can lead to suicide.
12	(Thombs et al., 2009)[30]	Their intention (adolescents) when driving a vehicle with 60 minutes after leaving work, 70% of those who use drugs.	A large number of high-risk behaviors among adolescents must be a priority focus for prevention efforts.
13	(Hops et al., 2011a)[31]	Specific interventions can reduce risky behavior in drug abuse for 18 months of follow-up in high-risk teens.	Drug abuse prevention interventions can have preventive effects for teens who are at risk.

Discussion

The purpose of this review was to explore the relationship between risk behaviors towards drug abuse in adolescents. The 13 articles that have been identified in table 1 show that risk behaviors towards health are a variety of activities carried out by people with a frequency or intensity that increases the risk of disease or injury. The term health behavior must be distinguished from risk behavior, which means an action associated with increased susceptibility to certain diseases[32].

Health risk behaviors are various behavioral engagements carried out by people with an intensity that increases their susceptibility to the risk of disease or injury or may have dangerous consequences.[33]. Risk behavior arises from risk factors originating from within adolescents, from family and from outside the family. Factors originating from adolescents are low achievement motivation and low self-esteem. Elements from the family are rigorous parents and little support. From outside the family are relationships with deviant peers and orientation towards excessive peers.[31,34–37] no studies have examined the similarity in risk content (e.g., substance use, sexual behaviors.

All teenagers have the risk to abuse drugs. However, several risk factors of drug abuse among adolescents, such as genetic risk factors are supported by the results of research that adolescents from alcoholic biological parents have 3-4 times the risk of drinking alcohol compared to adolescents from alcoholic adoptive parents, parenting in a vast family its influence on drug abuse in adolescents. The power of close friends to abuse drugs is more significant than in strangers.[38].

In risky behavior, for example, teens feel that they will not be at risk if they do not follow traffic signs. Second, the perception of severity, namely the level of one's belief that the consequences of health problems will become increasingly severe, for example, in risky behavior, adolescents who experience overweight problems will not add to health problems. Protection is needed to protect adolescents from risky behavior and the impact of risk behavior on health. The forms of protection include coping, commitment to achievement, control, and fulfilling developmental tasks. One way of security is the presence of power. With this control, it will prevent students from conducting risky behaviors to health and protect adolescents from the adverse effects of risky behavior on health. A person who has weak self-control will have a higher risk behavior, and if he has high self-control, the lower the risk behavior.

Conclusion

This review concludes that all deviant behavior is hazardous for adolescent health. Attitudes toward risk behavior referred to as adolescent's perception of vulnerability to the possible negative consequences of risky behavior. Numerous studies show that prototype perceptions are connected with teenagers' decisions about whether they will engage in risky behavior or not. Attitudes towards health risk behaviors are associated with health risk behaviors, including drug abuse. Therefore, control of behavior is pivotal as individual beliefs in his ability to manage any impulse that arises to behave negatively from within the individual towards channeling a more healthy and positive inspiration.

The Effect of Environmental Factors on the Enzyme Production of *Aeromonas Hydrophila* Isolates

Hawraa Natiq Kabroot AL-Fatlawy

Ph.D. Dr. Academic (Molecular Genetics) in Dep. of Medical Laboratory Techniques, Al-Toosi University College, Najaf, IRAQ.

Abstract

The current study demonstrates that the effect of some the environmental factors on enzymes production that included (heamolysin, protease, lipase and phospholipase enzymes) of *A.hydrophila*. The present study included the detection of *A.hydrophila*in some clinical cases and environmental sources in the governorate of AL-Najaf, (159) Clinical samples were taken from patients suffering from various infection at Al-Sadder Medical City and Al-Zahraa Educational Hospital during the period from October 2011 to March 2012. Also, (92) Environmental samples were involve three different of environmental regions(Kufa river, Bahar Najaf and tap water) .*A.hydrophila* isolates which were diagnosed by four method as (Culture method, biochemical tests, Api20E system and Polymerase chain reaction (PCR)). The results show that the optimal production of enzymes at temperature (37ºC) and pH (7) for clinical. While (22 and 37ºC) and pH (7 and 9), for environmental isolates. Some clinical and environmental isolates containing heamolysingene were tested Ligated Ileal intestinal of rabbit. The results indicate that the gene(*hyl*) was responsible for the pathogenicity of *A.hydrophila*, whereas causes accumulation of fluids in comparison with control positive (*V.cholera*) which caused accumulation of fluids and control negative (Normal saline).

Keyword: *A. hydrophila, ph, Temperature, the Environmental factors, Enzymes production.*

Introduction

Aeromonas hydrophila bacteria is one species of the genus Aeromonas that received increasing attention as opportunistic pathogens because of its association with human diseases and aquatic and terrestrial animal's infections[1].*A.hydrophila*is associated with both diarrheal and extraintestinal infection in human disease especially dangerous for children and persons with impaired immune system. The symptoms of the pathological features associated with infection caused by *A.hydrophila*refer to local enema, tissue necrosis, sepsis and mortality. The pathogenicity of *A.hydrophila* infection is complex and multifactoral and it›s attributed to a multiple virulence factors,including cell structural : lipopolysacchariede (LPS), outer membrane proteins (OMPs), pili and flagella, type III secretion system(T3SS) acts as adhesion structures and extracellular factors such as ex otoxin,aerolysins,heamolysins,*β*-lactamase, enterotoxin and sidrophore that seem to play an important role in pathogenesis[2]. The present study is carried out to achieve the following objectives:1-**Isolation** of *A.hydrophila* among the clinical cases and environmental regions in Najaf and identification by API20E system and the PCR technique,with used specific primer (16S r RNA) diagnostic gene. 2- Detectionthe virulence factors of *A.hydrophila* such as heamolysin, lipase,protease, gelatinase hydrolyze, phospholipase, sidrophore, capsule formation and adherence to uroepithelial cells of human among clinical and environmental isolates. 3- Determining the effect of some the environmental factors on enzymes production including (heamolysin, lipase, protease and phospholipase) of *A.hydrophila*. 4-Determination the pathogenicity of *A.hydrophila* in Rabbits.

Materials and Method

1. Samples Collection:

A. Clinical Samples: A total of 159 samples were involved 110diarrhea,11 sputum, 6 cerebral spinal fluid (C.S.F), 7 wounds, 6 burns,9 Blood, and 10 Urine samples were obtained from patients who attended to AL-Sadder Medical City and AL-Zahraa Educational Hospital in Najaf governorate during the period from October 2011 to the March 2012.

B. Environmental Samples: A total of 92 water samples from surface water were collected from three different loci (Kufa river, Bahar Al-Najaf,Tap water) during the period from October 2011 to the March 2012. *A.hydrophila* isolated from water by :

Each water sample was mixed 1 ml water with 9 ml of alkaline peptone water (APW) pH 8.6 to have 10 ml for each tube. Then it is incubated at 37 C° for 24hr. Loopful of incubated samples is streaked at the surface of thiosulphate citrate bile salt sucrose agar medium (TCBS) followed by overnight incubation at 37C°. The yellow/green rounded 2-3 mm colonies were picked and streaked over blood agar,MacConkey agar for further testing[3].

2. Identification of A. hydrophila:

1. Microscopic Properties: Gram's stain was used to examine the isolated bacteria for studying the microscopic properties as initial identification of A.hydrophila[4]

2) Cultural Characteristics:

Morphological colonies characteristics were recorded on the specific media for primary identification of A. hydrophila

3) Biochemical Tests :

Biochemical tests of *A.hydrophila*1-2 colony were tested for oxidase, catalase, Simmone Citrate, Kligler Iron agar and Indole tests and these entire tests positive [5].

3- Effect of theTemperature and pH on Enzymes Production of *A.hydrophila* .

*A.hydrophila*isolates was selected with high production for heamolysin,lipase,Phospholipase,protease enzymes for the purpose of studying the effect of temperature and pH in production of enzymes .

A-Temperature

The effect of temperature on virulence enzymes was detected according to method of [6]as the following :-

1- Inculcate 10ml of nutrient broth with a single colonies of *A.hydrophila*which have high ability to produce enzymes.

2- Incubate the test tube of different temperature (4, 22, 28, 37, 41,50) for 24 hr to (heamolysin,protease) and for 48-72 hr for (Phospholipase and lipase) .

3- Centrifuge the growth culture at 6,000×*g* for 30 min.

4- Collects the supernatant containing the enzyme in sterilized test tubes.

5- Transfer 50µl of the supernatant containing enzyme to wells (6 mm diameter) in specific media plates to each enzyme .

6- Incubate the plates at temperature 37ºC for 24hr for (heamolysin,protease) and at 48-72 hr for(Phospholipase,lipase) .

7- Measure the decomposition diameters for each enzyme and compare it at different temperature .

B- pH :

The effect of pH on the activity of enzymes was carried out at the same method of temperature except the following modification :-

1- Inoculate 10ml of nutrient broth with high activity isolates to produce enzymes, each tube have different pH ranging (3,5,7,8,9,10). Incubate the tubes at 37ºC for 24hr for (heamolysin,protease) and at 48-72 hr for(Phospholipase,lipase) .

2- Measure the decomposition diameters for each enzyme and compare it at different temperature .

4-Pathogenicity of *A.hydrophila*

Pathogenicity of *A.hydrophila*was detected by accumulation of fluids test is used in Rabbit Ligated Ileal Loop Model [7]. The method involved rabbit anesthesia by using 0.2 ml of kitamen (drug) and 0.3 ml of xylazine, and four regions are selected of rabbit intestinal loops(10cm)of length to more than one loop by separation with sterilized sutures. The two loops are injected with (1)ml of the bacterial suspension

of *A.hydrophila*isolates that give a positive result to heamolysin (*hyl*)gene in molecular study(PCR assay)of *A.hydrophila*to both isolates(clinical,environmental) and two concentrations(10^4 and 10^6) cell/ml are used, also other two loop of intestinal are injected with suspension of *V.cholera*bacteria as positive control and normal saline that consider as negative control in this study. After that intestinal is returned to animal body,and disappearance for anesthesia effect of rabbit. After (18-24hr) they are take out of the intestinal to observe accumulation of fluids inside each loop of ligated loops. The isolate that have pathogen effect, which is observed is the cause of accumulation of fluids in the loops of intestinal[8].

Results and Discussion

A total 251 samples were collected from clinical (159 (63.34%)) sample from patients suffering from different cases and 92(36.66%) from water . The samples are activated in APW media at 37C for 18-24h, then, they incubated on selective media such as Blood agar, MacConkey agar and TCBS agar at 37C for 18-24h . Whereas various isolation method including positive isolates .

Our result theidentification of *A.hydrophila* is depended on the colonial morphology, microscopical and biochemical tests as initial identification. The colonies of *A.hydrophila* are grown on culture media once revealed the typical characteristics being described by referential studies, that the colonies are yellow shin color on TCBS agar, with diameter ranged from (2-3)mm. In addition to those colonies appeared as pale like shaped on the MacConkey agar indicated that *A.hydrophila*is unable to ferment lactose sugar. Microscopical examination has revealed that *A.hydrophila* a gram negative bacillus, straight shape, singly or pairs and rarely as short chains, and not spore forming**.** In general, the genus *Aeromonas* are facultative anaerobic, oxidase positive, Gram negative bacteria whose natural habitat is in the aquatic environment. Some species are pathogenic for animals and humans [9]. The taxonomy of the genus *Aeromonas* has been confusing because of lack of matching between phenotypic and genotypic characteristics of species and multiple method that are required for accurate classification[10].

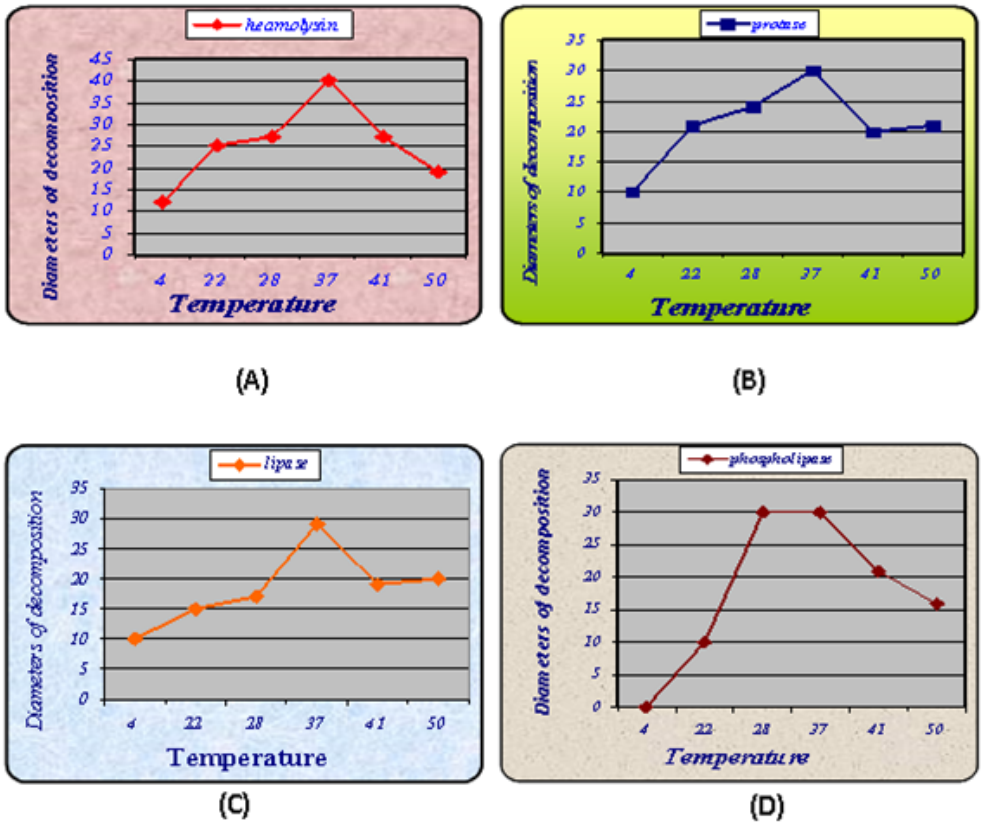
Identification of *A.hydrophila* depends on the colonial morphology, biochemical tests, Api20E system and molecular identification.These results are agree with[11,12]. The biochemical tests are accordance with the standard characteristics [4,5, 13,14]. API20E system is characterizes by fast detection of bacteria without the need for many of culture media as well as reduce cultural contamination, and it is used to confirm identification of *A.hydrophila,*[1].These results agree with [15,16,17].

- The Effect of Temperatureand pH on the Enzyme Production of *A.hydrophila*

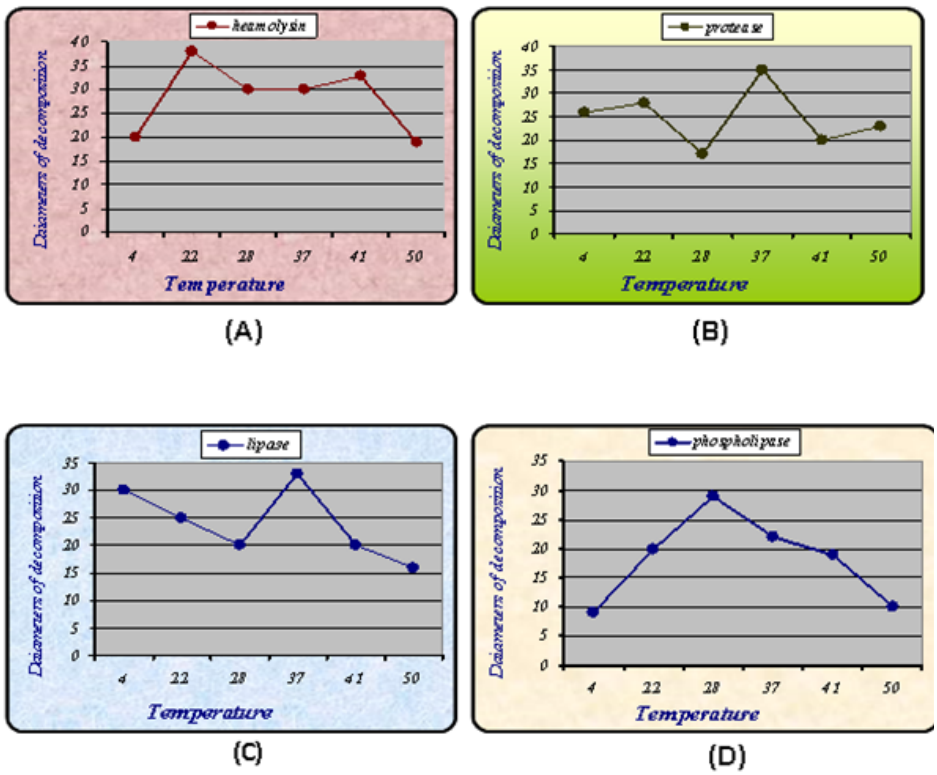
The presence study deals with the effect of the different incubation temperatures and pH values on the enzyme production such as, heamolysin, lipase, protease and Phospholipase of *A.hydrophila,*which are selected for the most efficient isolate of the other isolates was studies.

1 : Temperature

Our results demonstrates that *A.hydrophila*isolates growth at temperature range (4-50 ºC) and pH (3-10). The resulting in [fig,1] demonstrate the effect temperature effect on enzymes production for clinical *A.hydrophila* isolates was produces these enzymes at temperature range (4-50C°). The optimum production of heamolysin, protease and lipase was at 37ºC,while lower activity of enzymes production was at 4ºC. Either, Phospholipase enzyme was produced byclinical*A.hydrophila* isolates at temperatures 28 and 37ºC(optimum production),and the less productivity at temperature (22C°), while phospholipase does not produce at temperature (4C°). The study of influence of environmental factors helps to clarify the relationship between temperature, pH values on enzymes production of *A.hydrophila*isolates. *A.hydrophila* produces many extracellular factors such as enzymes and toxins [18]. [19] proposes a model for describing the effects of temperature,PH on the growth of *A.hydrophila*and shows that temperature and pH are the maine influence on the bacterium growth. In other hand, The effect of temperature on enzymes production among Environmental*A.hydrophila*isolates were shown in [fig, 2]. The optimum temperature for heamolysin production was at temperature 22ºC while it was 37ºC for protease and lipase enzymes. The lower production for heamolysin and lipase enzymes was at 50ºC, but it was 28ºC for protease enzyme. The optimum production for phospholipase enzyme was at 28ºC and lower activity was at 4ºC and 50ºC.



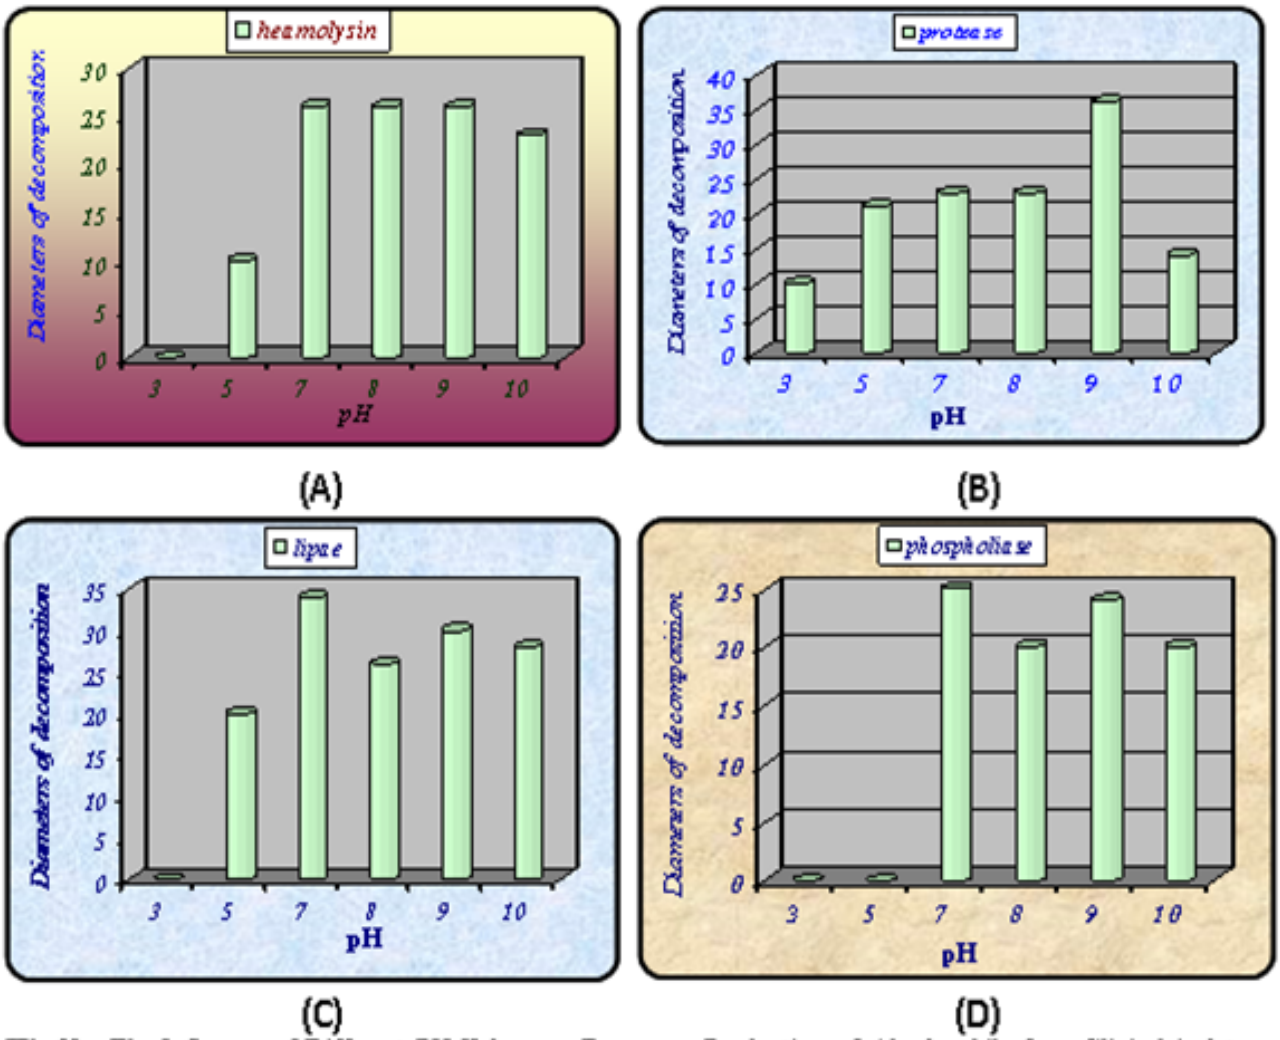
[Fig. 1]: The Effect of the different Temperature on Production of Enzymes of *A hydrophila* from Clinical Isolates: (A) - Heamolysin Production (B)- Protease Production (C)- Lipase Production (D) – Phospholipase Production.



[Fig. 2] : The Effect of The different Temperature on Enzymes Production of *A hydrophila* of Environmental Isolate:(A)Heamolysin Production (B)- Protease Production (C)- Lipase Production (D) – Phospholipase Production.

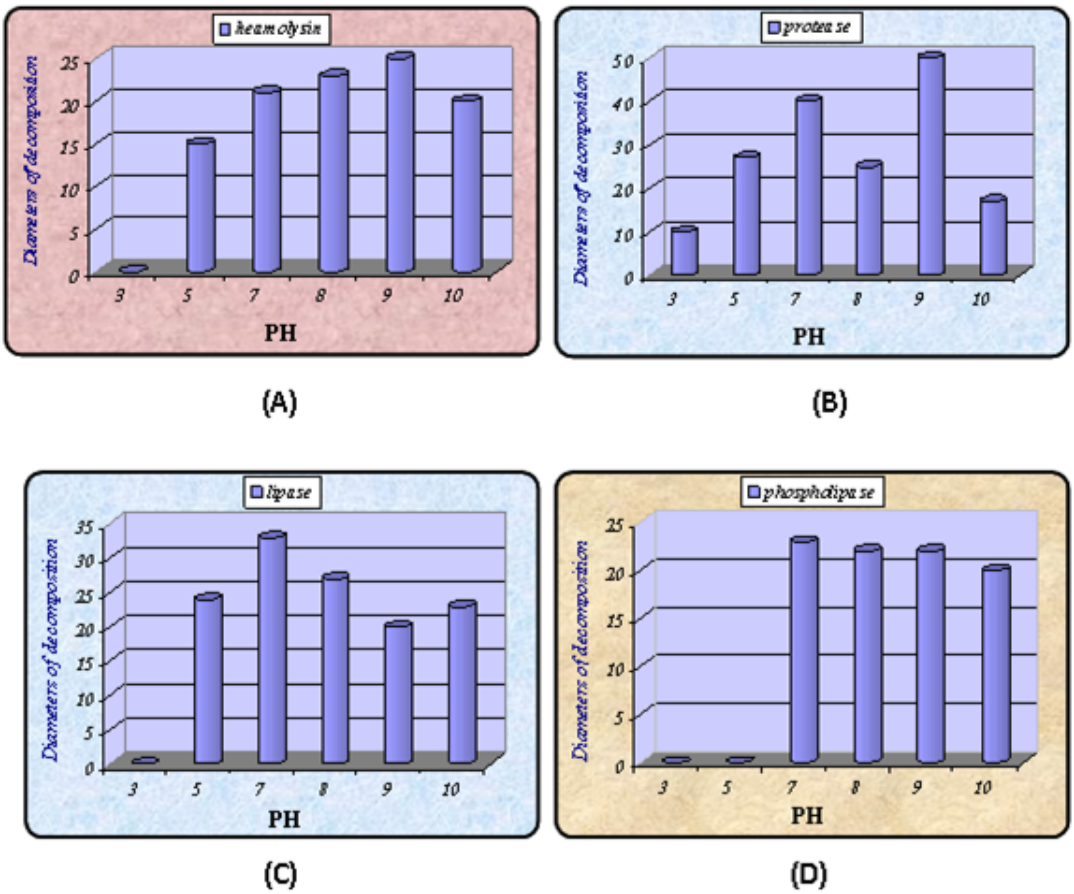
2 : pH

The results of pH in this study, the effect of different pH values on the production of heamolysin,lipase,protease and phospholipase enzymes among clinical *A.hydrophila* isolates as shows [Fig, 3]. The best production of heamolysin was showed at pH (7-9) and lower production at pH (5). The higher production of protease and lipase enzyme were at pH (7 and 9) and the lower production at pH (3 and 5) of both enzyme respectively. Lipase enzyme is not produced at pH(3). According to the results,*A.hydrophila*was high producer to Phospholipase enzyme at pH(7 and 9) whereas, no production was detected at pH(3 and 5). Whereas the influence of pH on enzymes production (environmental) high production rate is at pH(9), but lipase and phospholipase enzyme at pH(7) and the lower is at pH(5) but it does not produce at pH (3). These results were similar to[20]who demonstrated that heamolysin,lipase and elastase enzymes were effected with temperature and the optimum production for these enzymes was at(37ºC) and lipase was more effect in higher temperature dose not grow decomposition zone at 48ºC and 59ºC where the optimum pH for enzymes production was at (7) and *A.hydrophila*was not produced for these enzymes at pH (3, 4.5, 5).



[Fig,3] : The Influence of Different PH Values on Enzymes Production of *A.hydrophila* from Clinical isolates :(A)-Heamolysin production (B)-Protease production(C)-Lipase production (D)-Phospholipase production .

The influence of pH values on enzyme production among environmental isolates was shown in [fig, 4]. The heamolysin is highest production rate is at pH (9),and the lower production rate is at pH (5). Heamolysin does not produce at pH(3). Protease and lipase enzyme are best produced at pH (9,7),whereas the least production rate is at pH (3)for protease, and pH (9)for lipase,but does not produce at pH(3). Likewise, phospholipase enzyme production from *A.hydrophila* is higher productivity is at pH (7), lower productivity at pH (10) and do not produce at pH (3,5).However, they exhibit an acid stress response in that when they are acclimated at pH 5, the kill time at pH (3) is extended. Treatment with protein-inhibiting antibiotics prior to exposure to low pH eliminated the acid stress response, suggesting that protein synthesis is an important part of the acid stress response [19].



[Fig,4] : The Influence of Different pH Values on Enzymes Production of *A.hydrophila* from Environmental isolates:(A)-Heamolysin production (B)-Protease production(C)-Lipase production (D)-Phospholipase production .

Pathogenicity for *A.hydrophila*: The results of the presence study demonstrate the existence of the fluid accumulation in Rabbit Ligated Ileal intestinal loops injected with bacterial suspensions to *A.hydrophila*bacteria (isolated from clinical and environmental) which give a positive result to heamolysin gene in PCR technique .

The first loop that is injected with bacterial suspension with (10^4) cell/ml concentration of *A.hydrophila,* may have caused accumulation of fluids with clearly changes in this loop compared to the control loop. Likewise, the second loop which is injected a suspension of *A.hydrophila* from the same isolate but with (10^6 cell/ml) concentration, also causes accumulation of fluids with largest extend from other loops of the intestinal. The isolates of *A.hydrophila*that is isolated from Kufa river water also have caused accumulation of fluids but less than that of diarrhea isolates . The test is compared with loop for *V.cholera*bacteria that is considered as a positive control to these strain that has caused accumulation of fluid in constant loop to normal saline

and considered as negative control.[21]who indicates to the infection of suckling mice and the determination of fluid accumulation (FA) the gut is studied according to the method of[22,26]. The results agree with[8,23,24].[25] who found that experimental infected mice died between 18-24 hours with signs of septicemia, blindness and liver necrosis.

Conclusions

The followingconclusions are extracted from the present study: The frequency of *A.hydrophila*isolates in Najaf was higher among clinical and environmental isolates. Most clinical and environmental isolates produce many virulence factors involve heamolysin, lipase,protease, phospholipase. The best productivity of heamolysin,lipase,protease and phospholipase at temperature (37ºC), pH (7) in clinical isolates and (22 and 37ºC), pH (7-9) in environmental isolates. The bacteria *A.hydrophila*have exotoxin like heamolysin which is responsible for the pathogenesis of bacteria in lab animals (Rabbits).

Sleep Patterns in Overweight/Obese Adults in Baghdad City

Maha Sabah Ahmed Al-Jumaili

M.B.Ch.B., F.I.C.M.S (Family Medicine); Lecturer at College of Medicine-Baghdad University-Baghdad

Abstract

Background: Abnormal sleep patterns are health challenge facing the Iraqi community and related to modernized behavioral changes.

Aim of Study: To identify the prevalence of abnormal sleep patterns among overweight/obese adults in Baghdad city.

Patients and Method: A descriptive cross sectional survey carried out in two Nutrition Clinics in Baghdad. During six months including 250 overweight/obese adults. The short sleep duration was defined as <7 hours/ day and late sleep onset was defined as sleeping at 11 o'clock pm and later.

Results: Mean sleep duration was (7.23 hours). Sleep onset was in 66.8% of participants. Mean body mass index (BMI) was significantly higher in participants with short sleep duration ($p<0.001$). Short sleep duration was associated with younger age, male gender and negative medical history, while significant risk factors for late sleep onset are younger age, students and smoking.

Conclusions: The prevalence of abnormal sleep patterns among overweight/obese was high. There is a strong link between short sleep duration and higher BMI.

Keywords: *Overweight, Obesity, Sleep duration, Sleep onset.*

Introduction

Obesity is a global public health problem[1,2]. In Iraq, about one third of population are obese[3, 4]. Obesity in Iraq is commonly related to older age, female gender, illiteracy, unemployment and physical inactivity[5]. Sleep is main health need and required for many body functions. Many authors referred to adverse effects of sleep deprivation on health (physically and mentally) and affect the cognitive processes[6]. Lack of sleep exist when the human being biological need of sleep is not enough. Many definitions of sleep deprivation are found, but mainly the sleep deprivation is defined as sleep of less than 7 hours.[3] It was shown that short duration or poor quality of sleep lead toabnormal metabolism of glucose and abnormal secretion of anabolic hormones such as growth hormone[6], testosterone[7] and the prolactin[8], with changing of amount and time of secretion for other hormones such as glucocorticoids[9], catecholamines[10] with altering of diet balance[11,12].

Sleep deprivation and obesity are great health problems that are associated with many individual, social and health economic burden[13, 14,15]. Epidemiological studies held in USA revealed a direct linear association between duration of sleep and body mass index showing that abnormal sleep (long or short duration) was accompanied by adulthood obesity[16, 17]. Other literatures found abnormal sleep patterns significantly associated with increased BMI[18, 19,20]. Inversely, many authors documented no relationship observed between sleep duration and overweight or obesity[15, 21, 22].

Endogenous circadian system is regulating sleeping-awakening rhythms and other metabolism processes[23]. It was shown that timing of sleep early or late had

e-mail: maha4sj@gmail.com

a profound effect on cardiometabolic disorders[24-27]. Abnormal sleep patterns and inadequate sleep duration is commonly related to abnormal dietary habits and lifestyle changes like physical inactivity,heavy diet and sedentary lifestyle[28, 29].

In Iraq, the sleep problems are frequent among adults especially elderly age population[30-32].

Patients and Method

A cross sectional survey carried out in two Nutrition Clinics; Baghdad Teaching Hospital and Surgical Specialties Hospital in Baghdad. during six months; 1st of August, 2019 to 31st of January, 2020. Including 250 overweight or obese adults aged ≥18 years of both genders presented to Nutrition Clinics for management of overweight or obesity. Patients currently receiving sleep medications or sedatives, with mental health problems, depressive mood, pregnancy, lactation, night shifts occupation were excluded.

The data were collected by the researcher using a pre designed questionnaire prepared by the researcher depending on previous literatures. Data included general characteristics (age, gender, weight, height, occupation, marital status, smoking and medical history) and sleep patterns. Overweight or obesity defined according to World Health Organization standard values; obesity (BMI: 30 Kg/m^2 and more) and overweight (BMI: 25-29.9 Kg/m^2) [33].

The sleep patterns were assessed as the average for the last 7 days. Short sleep duration defined as sleep for<7 hours/day. Latesleep onset defined as sleeping at 11 o'clock pm or later[35].

The data were analyzed using the Statistical Package of Social Sciences software version 22. Appropriate statistical tests were applied accordingly at level of significance of 0.05 or less.

Results

This study included 250 overweight/obese adults with mean age of (40.8 years) .General characteristics of the study participants are shown in (Table 1).

Mean BMI of adults with short sleep duration was significantly higher than that of adults with normal sleep duration (P. value <0.001). No significant difference in mean BMI across sleep onset (P. value>0.05), (Table 2).

A significant association was found between short sleep duration and each of younger age, male gender, negative medical history and late sleep onset, in all comparison (P. value < 0.05). No significant association was found between sleep duration and other general characteristics variables, (P. value > 0.05), (Table 3).

Regarding the association between sleep onset and general characteristics variables of the study participants, a significant association was found between late sleep onset and each of younger age, being a student and smoking, in all comparison (P. value< 0.05). The association of sleep onset was neither significant with gender, marital status, nor medical history, (P. value > 0.05). (Table 4).

Discussion

Sleep is a vital process of our life [36]. Overweight and obesity steadily increased in Iraq during last year's[3, 37]. The present study found that 43.6% of overweight/ obese adults had short sleep duration. This findings close to results of Althakafi et al [38] in Saudi Arabia. Our study showed 66.8% had late sleep onset among which is higher than results of Baron et al [39] study in USA. Higher prevalence of late sleeping in current study might be attributed to advanced mobile phone technologies and publicity of social network programs in our society during last ten years. BMI of the study participants in our study was significantly higher with short sleep duration. This finding is consistent with results of previous literatures [40,41]. Our study found no significant relationship between sleep onset and BMI. This is might be due to that all included adults were overweight or obese and higher proportion of them had late sleep onset.

Current study showed a significant association between younger age overweight/obese adults and short sleep duration (p=0.008). Similarly, Grandner et al[42] study in USA revealed that relationship between sleep duration and body mass index is dependable on age and reported a significant relationship between short sleep duration and higher BMI among young adults, U- shaped relation between sleep duration and BMI among middle age adults and less relationship among elderly. These findings are due sociocultural changes in community and widespread technologies that affect young age population leading to shorter sleep duration. Our study found also a highly significant association between males overweight/obese adults and short sleep duration (p<0.001). This finding is consistent with results of Watanabe et al [43] study in Japan which stated that increased weight is associated with short sleep duration among men but not among women. In present study, there was a significant association between positive medical history of overweight/obese adults and normal sleep duration (p=0.04). This finding might be attributed to fact that elderly age adults accompanying with positive medical history in present study are associated with normal sleep duration than younger age.

In current study, there was a significant association between younger age overweight/obese adults and late sleep onset (p=0.004). This finding coincides with results of Ferranti et al [44] which reported a significantly increased body mass index of young age adults with late sleep onset. Our study found a highly significant association was observed between students overweight/ obese adults and late sleep onset (p<0.001). This finding is similar to results of Gradisar et al [45] study in Australia which reported higher prevalence of delayed sleep onset among younger age students that are related to

obesity and sedentary lifestyle. The habitual changes for young adults is related to advanced technology recently attributed to poor sleep quality[45]. In present study, there was a significant association between smoking of overweight/obese adults and late sleep onset (p=0.003). This finding is in agreement with results of Tan et al [46] study in Sweden.

Present study found a highly significant association between late sleep onset of overweight/obese adults and short sleep duration (p<0.001). Consistently, Cooper et al [47] study in USA found that sleep duration less than 7 hours is related to obesity of adults and this short sleep duration is strongly linked to late sleep onset. Poor outcomes of abnormal circadian rhythm are aggravated by short sleep duration leading to abnormal metabolic processes and reduction of insulin sensitivity causing overweight and obesity[35]. The main limitations in present study were the inability to assess the direction of relationship as the design is cross sectional, selection bias and absence of adults with normal BMI to compare the sleep patterns with them.

In conclusion, the prevalence of abnormal sleep patterns (short sleep duration or late sleep onset) among overweight/obese adults is high. There is a strong link between short sleep duration and increased body mass index of adults. The common risk factors for short sleep duration are younger age, male gender and negative medical history, while common risk factors for late sleep onset are younger age, students with smoking history. This study recommended more efforts from health authorities and community based institutes to encourage normal patterns and prevent the behaviors that are accompanied by shorter sleep duration or late sleep onset especially for young age population. Further multicenter national surveys on effect of abnormal sleep patterns on health of adults must be supported.

Ethical Clearance: Informed consent was obtained from all participants, Data were collected in accordance with declaration of Helsinki of the World Medical Association, 2013

Abstract

Background: Activated partial thromboplastin time and prothrombin time measures the action of the intrinsic and extrinsic pathways of coagulation needed to maintain homeostasis in the body. We studied aPTT and PT levels in acute myocardial infarction (AMI) patients on anticoagulation therapies and normal subjects. The aim of the study is to assess aPTT and PT in patients of acute MI on anticoagulation.

Materials And Method: This study was conducted on 42 patients with chest pain and 84 AMI patients, admitted to Dhiraj hospital, Vadodara. The AMI patients were classified into STEMI (n=28) and NSTEMI (n=56). PT and aPTT were assayed on a fully automatic Stago-coagulometer instrument (STA Compact Max).

Conclusion: Patients with STEMI had mean aPTT of 40.79 ± 1.83 s, NSTEMI had 41.33 ± 2.06 s, aPTT in control subjects was 31.35 ± 0.48 s. Patients with acute coronary syndrome had significantly higher levels of aPTT. Patients with STEMI has PT of 17.42 ± 5 s, NSTEMI had 18.56 ± 5 s. Patients on anticoagulation therapy had higher aPTT and PT values.Both PT and aPTT are high in acute MI patients on anticoagulants. The elevations in PT values were more than 3 fold greater than aPTT suggesting that PT has a higher sensitivity for predicting blood clotting capacity in patients already on anticoagulations.

Keywords: *AMI, STEMI, PT, aPTT, thromogenic potential.*

Introduction

For maintenance of hemostasis, there is a balanced equilibrium needed between thrombus destruction and thrombus formation. This fine balance is maintained by aninteractive foreplay between platelets, coagulation factors, the vascular endothelium and the fibrinolytic system. The coagulation cascade involves an interaction between the contact activation pathway or the intrinsic system and the tissue factor pathway or the extrinsic system. These two independent pathways lead to the conversion of factor X to Xa, which is the beginning of the common pathway. This common pathway converts prothrombin to thrombin, which subsequently catalyzes the formation of fibrin and ultimately leads to the stabilization of aggregated platelets to form a stable clot[1,2]

PT measures the number of seconds it takes to form a clot in our sample of blood after reagents are added. The PT is often performed along with a partial thromboplastin time (PTT) and together they assess

the amount and function of coagulation factors that are needed for blood clot formation.

- The PT test evaluates coagulation factors in the extrinsic and common pathways of the coagulation cascade work together: factors I (Fibrinogen), II (Prothrombin), V, VII and X.
- The aPTT, which evaluates the clotting factors that are part of the intrinsic and common pathways: XII, XI, IX, VIII, X, V, II (prothrombin) and I (fibrinogen) as well as prekallikrein (PK) and high molecular weight kininogen (HK)[3]

During a laboratory test, there are two "pathways" that can initiate clotting, the extrinsic and intrinsic pathways. Both of these then merge into a common pathway to complete the clotting process[4]. Increase fibrinopeptide A in MI predisposes patients to increased risk for sudden cardiac death[5]. Increase in fibrin turn over can be estimated by plasma concentrations of crosslinked FDP's (fibrin degradation products), proves to be a marker for risk of myocardial infarction[6]. Soluble fibrin was found significantly higher in acute coronary syndrome patients than in controls especially in young myocardial infarction[7]. The PT and PTT evaluate the overall ability to produce a clot in a reasonable amount of time and, if any of these factors are deficient in quantity or not functioning properly, the test results will be prolonged.

Materials and Method

This study was conducted on 84 AMI patients and 42 patients with chest pain, admitted to Dhiraj Hospital coronary care unit, Sumandeep Vidyapeeth deemed university, Vadodara, Gujarat for a period of 1 year from January 2019 to January 2020. The AMI patients were classified into STEMI (n=28) and NSTEMI (n=56). Mean age group of STEMI, NSTEMI patients were 60-70 years and 50-60 years respectively. All the AMI patients received standard IHD treatment according to recent ACC/AHA guidelines.

The diagnosis of myocardial infarction done by any two:

(i) Troponins levels above the 99th percentile of upper limit of normal

(ii) History of prolonged dull aching radiating chest pain or discomfort with perspiration

(iii) Presence of new bundle branch blocks, Q waves or new abnormal ST-T depressions or elevations[8].

Patients with STEMI were classified on the basis of:

(i) ST-segment elevation of ≥0.1-0.2mV in ≥2 contiguous precordial leads or ≥0.2mV in ≥2 contiguous limb leads or development of new left bundle branch block.

(ii) Presentation within the first 24 hours from first episode of chest pain.

(iii) Continuous chest pain not relieved by nitrates or rest and lasting ≥30 min[9].

Patients with NSTEMI were required to have:

(i) ST segment downloping sagging of ≥0.1-0.2 mV in ≥3 contiguous ECG leads.

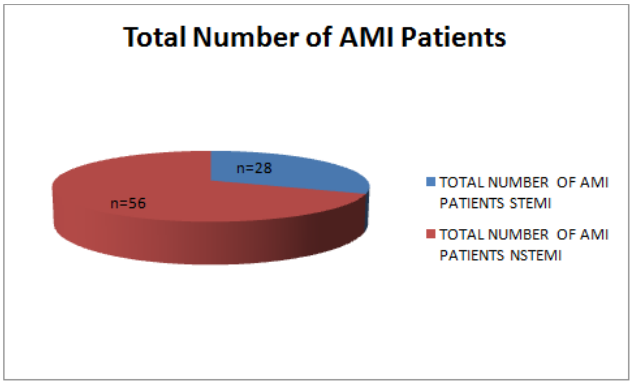
(ii) Typical radiating chest pain even at rest lasting ≥ 15 min[9].

The patient exclusion criteria included chronic inflammatory diseases, active infection, recent surgery, significant renal or hepatic dysfunction and malignancy.

Blood samples for aPTT and PT were collected in 3.2% trisodiumcitrate anticoagulant vaccutainers in the proportion of 1 volume of citrate to 9 volumes of blood is processed by centrifugation at room temperature for 15 minutes at 2000 rpm. Prothrombin time (PT), activated partial thromboplastin time (aPTT) assayed on a fully automatic Stago coagulometer instrument (STA Compact Max) which is based on clotting time or clot-based tests (i.e. chronometric) measurements and photometric assays (at specific wave lengths) on plasma samples.

Results and Discussion

This study was conducted on 84 acute MI patients and 42 patients with chest pain. The AMI patients were classified into STEMI (n=28) and NSTEMI (n=56) (Graph 1). Mean age group of STEMI, NSTEMI and chest pain patients were 65-75 years, 55-65 years and 45-55 years respectively (Table 1). Their were significant increase in PT level in NSTEMI from 13 s to 23 s as compared to control group which ranges from 11 s to 14 s. PT levels in patients with STEMI ranging from 12 s to 22 s. The level of aPTT in control subjects was 30 s to 40 s. Patients with NSTEMI shows 37 s to 47 s and STEMI shows 35 s to 45 s which has significantly higher levels of aPTT. (Table 2).



Graph 1: Total number of AMI patients.

2	Nstemi	13-23 sec	37-47 sec
3	Control	11-14 sec	30-40 sec

Patients of acute myocardial infarction are on dual antiplatelets and anticoagulants like unfractionated heparin, low-molecular weight heparin or warfarin, for which PT and aPTT are used.

PT/INR detects disorders of the extrinsic and common coagulation pathways. Abnormal result is usually seen when factor I, II, V, VII, X are deficient [10] while the aPTT looks for abnormalities of the intrinsic and common coagulation pathways. It monitors the activities of FI, II, V, VIII, IX, X, XI, XII[11]. Schwartz et al[12] studied 220 subjects with acute coronary syndrome and found out that 30 (13.6%) and 28 (12.7%) had INR and aPTT values not within the reference range. Salamonson studied that patients reaching the therapeutic aPTT threshold after heparin treatment within 1 day were less than those who did not reach threshold suggesting that a non-weight based heparin regimen is ineffective in the achievement of therapeutic aPTT[9]. Pearson showed positive correlations for myocardial infarction and death in ACS patients treated with unfractionated heparin but negative correlations between aPTT and the day of onset of recurrent angina. aPTT tended to be prolonged in the group with physical training, while it was shortened in the control group[13]. Granger et al[14] showed a positive correlation between the aPTT and the risk of subsequent reinfarction. PT and aPTT may also be used to monitor therapy in acute myocardial infarction with or without venous thromboembolism, atrial fibrillation or LV clot.

Conclusion

Both PT and aPTT are useful to measure the thinning potential of the blood and can be used to guide medical therapy and post PTCA patients also to prevent stentthrombosis. The values of aPTT are higher in acute coronary syndromes due to associated usage of anticoagulation to stop further thrombosis in coronaries. The elevations in PT values were more than 3 times higher than aPTT suggesting a greater responsive potential of PT for predicting blood clotting tendency in patients receiving anticoagulation therapy.

Abstract

Introduction: Forensic anthropometry dealing with the application of anthropometric measurements of human individual for the purposes of the identification of human remains. Inter and intra population variations can be observed in relation to anthropometric measurements due to factors such as genetic makeup, age, gender and ethnicity and help in the identification of individual in criminal investigations.

Method: This is cross sectional study using young adult students of age group 17 to 24 years. Participants enrolled after due consent and stature(S) and forearm length (FAL) were measured using standard anthropometric techniques. SPSS statistical package used to calculate Pearson's coefficients of correlation and regression equations between stature and the anthropometric variables.

Results: There were total 255 participants including 54 (21.18%) males and 201 (78.82%) females. Regression equation for estimation of stature from right forearm length is S = 1.4111 Rt FAL+ 126.72, and from left forearm length is S = 1.3774 Lt FAL+ 128.39. There were strong positive correlations between height and forearm lengths in all regressions ($r > 0.9$; $p < 0.0001$).

Conclusions: The proposed regression equations based on forearm length presented here will simplify the task of stature estimation for adults in clinical forensic medicine or as aids to the identification in criminal investigation in endogenous population. The left forearm length is more accurate in estimating the stature of young adults of western Indian population.

Introduction

Anthropometry refers to the systematic measurement of the physical properties of the human body, mainly dimensional descriptors of body size and shape. The science dealing with the study of systemic measurements of the human individual is called as Anthropometry.[1] Forensic anthropometry dealing with the application of anthropometric measurements of human individual for the purposes of the identification of human remains. Other medicolegal facts can be determined such as establishing the age at the time of death, sex, stature, body type (somatotype) and any other distinguishing characteristics based on physical and skeletal measurements helping in identification of the deceased individual.[2,3]

In the field of scientific research in Clinical Forensic Medicine, various anthropometric parameters likearm

span, biacromial shoulder width, hand length, forearm length, foot length and breadth, etc. may be used to predict the stature i.e. individual's height.[4,5] Various studies conducted to predict stature using various parts of human body and skeleton.[6] Forearm length can be helpful in predicting the individual's stature in mutilated bodies with remains involving upper limbs.[7] The stature can be predicted on the basis of forearm length and can be estimated using various regression equations.[8,9]

Several researchers studied relation between stature and upper limb segments measurements such as arm span, Biacromial width, arm length, forearm length, hand length in different populations.[5-15]Many authors had been demonstrated strong relationship between stature and forearm length.[8, 9, 14-16] Due to racial and ethnic variations in Indian population, the region-wise, population-based anthropometric studies are necessary in India. This study was undertaken to compare the stature (S) to forearm length (FAL) in western Indian population involving young adults to formulate a regression equation and to determine correlation between Stature and Forearm length.

Materials and Method

Study design and Procedure: This was a cross sectional study conducted in the Department of Agadtantra, APM's Ayurved Mavidyalaya, Sion, Mumbai, Maharashtra, India after institutional ethical committee approval. The study was conducted over a period of 2 years, from June 2015 to June 2017. Most of the students of this institution in this period, those fulfilling the inclusion criteria and giving voluntary consent to involve in the study were considered as the subjects for this study.

Study Participants: By simple random sampling, two hundred fifty-five students (54 males & 201 females) of this institution with ages between 17 to 24 years were included in this study. The written informed consent was taken from all subjects. The students of this specific region of ancestral origin were the target population. All subjects were measured approximately at the same time in the morning hours. Subjects with limb or vertebral column deformities, injury, fracture or those who underwent an operative procedure on spine/extremities, or abnormal gait were excluded from the study. All the measurements were tabulated and subjected to statistical analysis.

Measurements: Stature, forearm lengths of right (Rt) and left (Lt) forearms of the subjects were measured. The unit used throughout the study is centimeters. All observations were recorded in a predesigned proforma. Measurements were taken by the first author to avoid inter-observer bias

Stature (S): Stature (S) was measured with a stadiometer with movable headboard. It was taken from the vertex to the floor with the person standing barefoot in the anatomical position and with the head in Frankfurt horizontal plane (i.e. the line joining the inferior margin of the orbit and upper margin of external auditory meatus). The subjects were asked to stand on a horizontal even surface against a vertical plane in an erect posture, with feet in close approximation, hands by their side. The shoulders and buttocks were touching the vertical plane.

Forearm Length (FAL): The subject asked to stand erect with back to the wall, both arms abducted to 90°. For taking measurements, the forearm on each side is flexed at 90^0 at elbow joint with extended wrist and the palms facing upwards. The forearm & hand is supported on a flat adjustable top of a table for measurement purposes. Forearm length was measured with a flexible steel tape from the tip of the olecranon process to the point between radius & ulnar tuberosity. Readings were taken to the nearest 0.1 cm.

Statistical Analysis: The data obtained were analyzed statistically using SPSS (Statistical Package for Social Sciences) version 16.0 computer software (SPSS, Inc., Chicago, IL).

Results

There were total 255 participants including 54 (21.18%) males and 201 (78.82%) females. The descriptive statistics for stature and forearm length are shown in **Table 1**.

Table No. 1: Descriptive Statistics of stature (S) and Forearm length (FAL) of whole sample.

Parameter	Minimum	Maximum	Mean	Std. Deviation	N	SEM
Stature(S)	145.0	179.0	161.172	6.7755	255	0.4239
Right Forearm Length (Rt FAL)	12.5	35.7	24.4	4.704	255	0.29
Left Forearm Length (Lt FAL)	11.9	35.8	23.8	4.858	255	0.30
Average Forearm Length (Av FAL)	12.2	35.75	24.1	4.774	255	0.30

The differences between male and female group were compared using unpaired t-test (S, Rt FAL, Lt FAL, Av FAL). Stature (S) of the participants ranged from 152.0 to 179.0 cm in males and 145.0 to 175.0 cm in females. Mean stature in males (167.8 cm) was significantly larger ($p < 0.001$) than that in females (159.4 cm).Right Forearm (Rt FAL) of the participants ranged from 17.6 to 35.7 cm in males and 12.5 to 34.4 cm in females. Mean Right forearm in males (28.9cm) was significantly larger ($p < 0.001$) than that in females (23.2 cm). Left Forearm (Lt FAL) of the participants ranged from 16.9 to 35.8 cm in males and 11.9 to 34.2 cm in females. Mean left forearm in males (28.5 cm) was significantly larger ($p < 0.001$) than that in females (22.5 cm). Average Forearm (Lt FAL) of the participants ranged from 17.25 to 35.75 cm in males and 12.2 to 34.3 cm in females. Mean average forearm in males (28.7 cm) was significantly larger ($p < 0.001$) than that in females (22.9 cm).Sex-wise descriptive statistics for stature and forearms length are shown in **Table 2.**

Table 2: Sex-wise descriptive statistics for Stature (S), Right Forearm length (Rt FAL), Left Forearm length (Lt FAL), Average Forearm length (Av FAL).

Indicator	Stature (S).		Right Forearm Length (Rt FAL)		Left Forearm Length (Lt FAL)		Average Forearm Length (Av FAL)	
	Sex		Sex		Sex		Sex	
	F	M	F	M	F	M	F	M
Count	201	54	201	201	201	54	201	54
Minimum	145.0	152.0	12.5	17.6	11.9	16.9	12.2	17.25
Maximum	175.0	179.0	34.4	35.7	34.2	35.8	34.3	35.75

Scatter diagram and regression line plotted to show relationship for whole sample for estimation of stature from Right forearm, left forearm shown in **fig. 01 to 02.**

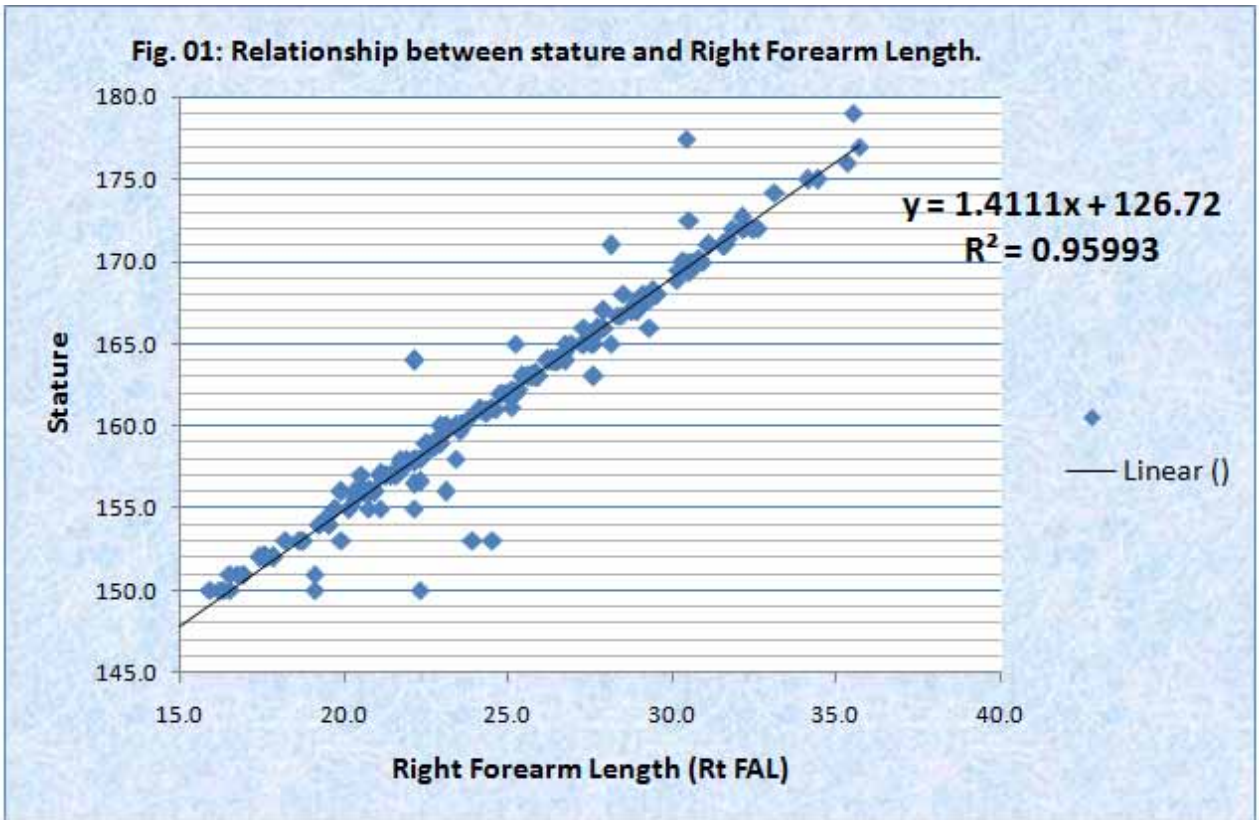

Figure 1: Scatter diagram and regression line showing relationship between stature and Right Forearm length. (All dimensions in Centimeters).

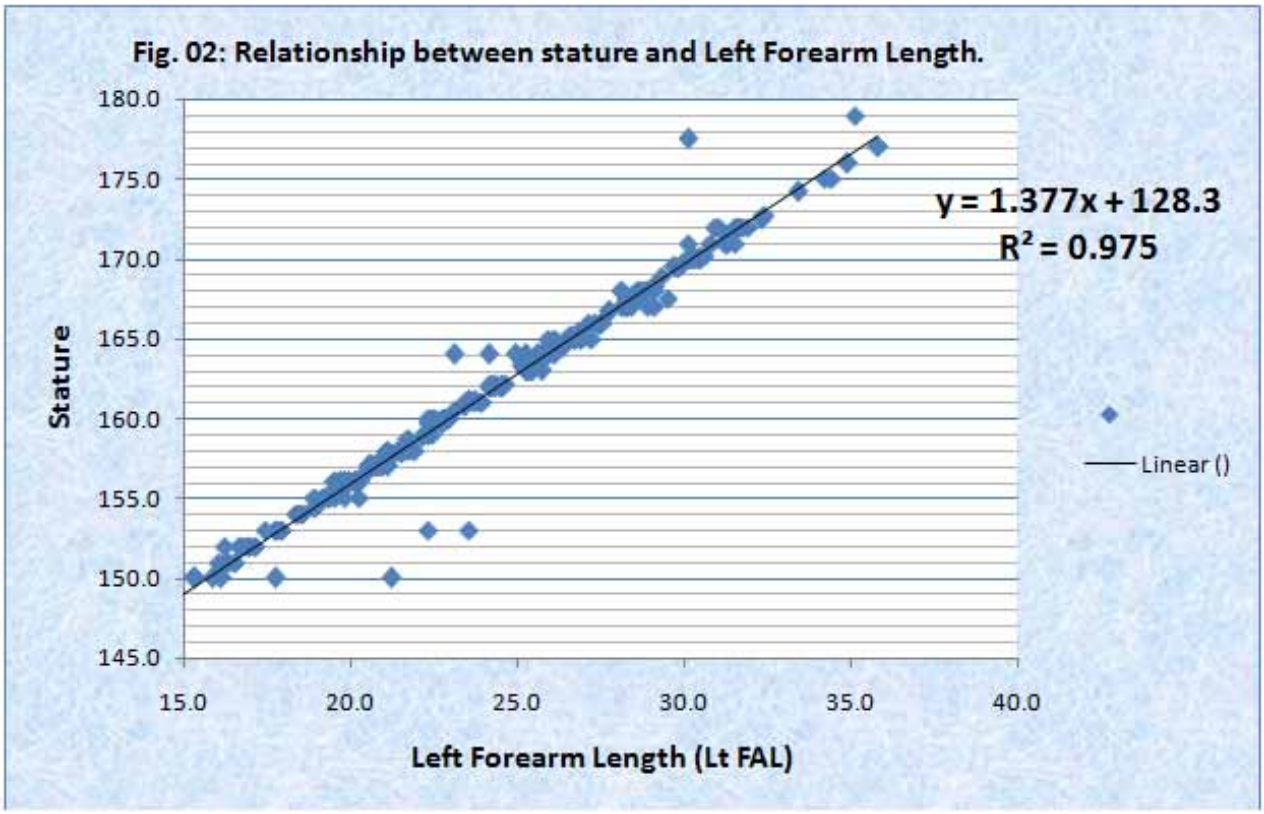

Figure 2: Scatter diagram and regression line showing relationship between stature and Left Forearm length. (All dimensions in Centimeters).

Linear regression equations were derived for whole sample, for total males & females separately for estimation of stature from right forearm length, left forearm length and average forearm length. The right arm length and left forearm length were used as the dependent variable to calculate the estimated stature. The resulting linear regression equation in the form of y = ax+ b (where, 'y' is stature in centimeters; 'x' is actual forearm length in centimeters; 'a' is the slope of regression line and 'b' is the intercept of the regression line) were tabulated in **table no. 03**.

Table No. 03: Various Linear regression equations for stature with forearm lengths (Right, Left average in whole sample, male & females.

Regression Group	Linear Regressions	Linear Regressions	R^2	R
Stature with Right Forearm length (whole Sample)	y = 1.4111x+126.72	S = 1.4111x+126.72	0.95993	0.979760
Stature with Left Forearm length (whole Sample)	y = 1.3774x+128.39	S = 1.3774x+128.39	0.97523	0.987537
Stature with Average Forearm length (whole Sample)	y = 1.3982x+127.46	S = 1.3982 AV FAL+127.46	0.97056	0.985170
Stature with Right Forearm length (Female)	y = 1.3852x+127.26	S (F) = 1.3852 RT FAL (F)+127.26	0.94867	0.973997
Stature with Left Forearm length (Female)	y = 1.3711x+128.52	S(F) = 1.3711 LT FAL (F)+128.52	0.96888	0.984317
Stature with Right Forearm length (Male)	y = 1.4296x+126.42	S (M) = 1.4296 RT FAL (M)+126.42	0.94067	0.969881
Stature with Left Forearm length (Male)	y = 1.3817x+128.32	S (M) = 1.3817 LT FAL (M)+128.32	0.95908	0.979326
Stature with Average Forearm length (Female)	y = 1.3828x+127.78	S (F) = 1.3828 AV FAL (F)+127.78	0.96207	0.980852
Stature with Average Forearm length (Male)	y = 1.4138x+127.14	S (M)= 1.4138 AV FAL (M)+127.14	0.95583	0.977666

Right Forearm length (Rt FAL) showed high positive value of correlation coefficient (>0.9) which suggest a strong positive correlation between stature and Rt FAL **[Figure 1].** Standard error for the total sample is ± 0.29. The equation derived for total sample can be used within the predictive range (R^2) of ± 0.9599 for right forearm length. Left forearm showed high positive value of correlation coefficient (>0.9) which suggest a strong positive correlation between stature and left forearm length **[Figure 2].** Standard error for the total sample is ± 0.30. The equation derived for total sample can be used within the predictive range (R^2) of ± 0.9752 for Left Forearm length. Regression equation for estimation of stature from right forearm length is **S = 1.4111 Rt FAL+ 126.72**, and from left forearm length is **S = 1.3774 Lt FAL+ 128.39**.

The observed linear correlation of the various parameters tabulated with Pearson's correlation coefficient value tabulated in **table no. 04**.

Table 04: Correlations for whole sample size (Whole sample)

		Stature	Right FAL	Left FAL	Average FAL
Stature (S)	Pearson Correlation	1	.980**	.988**	.985**
	Sig. (2-tailed)	-	.000	.000	.000
	N	255	255	255	255
Right FAL	Pearson Correlation	.980**	1	.994**	.998**
	Sig. (2-tailed)	.000	-	.000	.000
	N	255	255	255	255

		Stature	Right FAL	Left FAL	Average FAL
Left FAL	Pearson Correlation	.988**	.994**	1	.999**
	Sig. (2-tailed)	.000	.000	-	.000
	N	255	255	255	255
Average FAL	Pearson Correlation	.985**	.998**	.999**	1
	Sig. (2-tailed)	.000	.000	.000	-
	N	255	255	255	255

**Correlation is significant at the 0.01 level (2-tailed).

Regressions are given in Tables indicates highly significant results for all regressions ($r > 0.9$; $p < 0.0001$); t-statistics for intercepts and slopes likewise display high significance in all cases. Correlations between stature to Right forearm length/left forearm length are very high for all and highly predictive with the left forearm measurements.

Discussion

In absence of whole body of individual, where the accurate, direct measurement for stature is not possible, other parameters are used to predict individual's stature as it is the most important and useful anthropometric parameter to establish the physical identity of an individual.[2,4] Forearm length can be used to predict stature in mutilated remains involving part of upper limb of deceased person or in living subjects, if stature measurement not possible due to vertebral column deformity, bedridden, old or frail patients.[5-7]

In the present study, a total of 255 students between the age of 17 and 24 years were considered. As maximum height of an individual is attained between 17 and 24 years,these individuals were selected for the study. Many recent studies [8,9,11,14-16] also enrolled subjectsof same age group.

In present study, we observed that the males have higher anthropometric measurement than that of females.[8-11] These differences can be due to gender associated hormonal factors, genetic factors and lifestyle factors. Age of puberty being later in males and even the bony epiphyseal fusions are around two year later in males as compared to females leads to additional growth and increase in height. Inter and intra population variations were observed in relation to anthropometry due to factors such as genetic makeup, age, gender and ethnicity.[9-14]

In our study, mean right forearm length in male (28.9) was more than female (23.2), and mean left forearm length in male (28.5) was more than female (22.5). The differences were statistically significant ($P < 0.001$). So, the same regression equation can't be used in both sexes to estimate stature. We found strong correlation between stature and forearm length and it was similar to the previous studies.[9,15,16] Chikhalkar et al[9] showed that the highest degree of correlation ($r = 0.6558$) with forearm length followed by foot-length ($r = 0.6102$) of stature. Our study showed the comparable results with more strong correlation.

Ilayperumaet al[14] conducted a study on 258 medical students (140 males and 118 females) of faculty of medicine, university of Ruhana, Galle, Srilanka in age range of 20-23 years with a mean value of stature in males and females was 170.14± 5.22cm. The mean forearm length in Srilankan male and females was 27.56± 1.30 and 25.11± 1.24cm compared with Western Indian males and females was 28.5 ± 4.17 cm and 22.5± 4.2 cm respectively. The r vale values for Shrilankan males & females were 0.66 and 0.76 respectively and 0.9843 and 0.9793 for Western Indians, respectively.

Nath et al[15] conducted a research for reconstruction of stature using percutaneous length of forearm bones among the 199 Munda (110 males and 89 females) of Midnapur district, West Bengal in age group of 18-30 years. The mean value of stature in males was 156.19cm whereas in Western Indian males it was 167.8 cm. Similarly, the mean value of stature in Munda females was 148.64cm whereas in Western Indian females were 159.4 cm. The mean values offorearm length in Munda males and females was 24.60 cm and 22.85 cm respectively and in Western Indian males & females were 28.5 cm and 22.5 cm for left forearm and 28.9 cm and 23.2 cm for right forearm, respectively.

2.2cm and 26.56± 15.01cm respectively. The 'r' value was 0.66 and 0.76 in Srilankan and 0.601 and 0.53 respectively for North Indians

The stature found by different authors[5,8,9,14-16] in India in different region or state is different than the present study. Author from Chandigarh (North India)[16] found mean (SD) stature of male was 168.2 (6.5) and offemale was 155 (5.2). These variations could be due to different genetic constitution, environmental factorsand nutrition in different population groups.[15,16] In this study, students were enrolled which are from middleto higher socioeconomic class. So, the anthropometric measurements may be on higher side in comparison to the general population. A community based study to formulate regression equation for all population needed.

Conclusion:

Average Stature of male was 167.8 (± 5.9) cm, and it was more than female [159.4(± 5.9) cm] with statistical significance. Similarly, right and left forearm lengths of male was more than that of female. We found correlation coefficient (*R*) of 0.9699 in male and 0.9739 in female for stature using simple regression with right forearm and 0.9698 in male and 0.9843 in female for stature using simple regression with left forearm, which shows strong correlation between stature and forearm length. Stature can be accurately estimated from forearm length more precisely with left forearm length using simple regression equation.

We proposed that these regression equations presented by this study will help the task of stature estimation for adults in forensics to aids in identification in criminal investigation. Especially in endogamous populations, correlation coefficients for forearm lengths and stature are high, and thus applicable for identification in the forensic field. These population specific results may be applied in endogenous populations only.

Abstract

Background and Objectives: UTI is a common bacterial infection known to affect the different parts of the urinary tract and the occurrence is found in both males and females. It's the most common site of nosocomial infection, accounting for greater than (40%) of the total number reported by hospital and affecting about (600,000) patients each year. The objective of this study is to assess the knowledge of regarded preventive measures among nursing college students and to determine the association between their knowledge and selected demographical data.

Materials and Method: A cross-sectional study was conducted among (120) students enrolled in the nursing college at Mosul university during the period of 25st January, 2019 to 25th of May, 2019. A self-administered structured questionnaire which consists of (16) items was obtain to assess the knowledge regarding preventive measures of UTI and other demographic details. The SPSS (version 18) was used for the data analysis. The demographic characteristics of the study samples were reported by using descriptive statistics (frequencies, percentages, and mean). The mean of scores were compared by one-way ANOVA were done to find the association between variables.

Results: The results of the present study showed that (40.8%) of respondents were belonged tothe age group (20-22) years old, more than half of them (55%) were females, and the majority of them (86.7%) were single.

Conclusions: The study concluded that the general level of the knowledge among the participants was overall (52.5%) of the (120) participants had moderate level of knowledge, while (36.7%) of them had poor knowledge regarding preventive measures of urinary tract infection.

Recommendations: Based on the results of the study, the researchers recommended the necessary to preparation of educational programs for students of the university of Mosul to develop their knowledge and knowledge about the seriousness of UTI diseases, as well as the establishment of units for counseling and health guidance.

Introduction

Urinary tract infections (UTIs) are characterized by colonization, invasion and multiplication of microorganisms in the urinary system[(1)(2)]. UTI is an infection of the urinary system that may involve the lower urinary tract or both the lower and upper urinary tract[(3)]. UTIs are considered as the most frequent

bacterial infections worldwide[4][5]. UTI is a common bacterial infection known to affect the different parts of the urinary tract and the occurrence is found in both males and females. Urinary tract infections (UTIs) are caused by pathogenic microorganisms in urinary tract (the normal urinary tract is sterile above the urethra). UTIs are generally classified as infections involving the upper or lower urinary tract and further classified as uncomplicated or complicated depending on other patient related conditions[6-8]. The urinary tract is the most common site of nosocomial infection,accounting for greater than 40% of the total number reported by hospital and affecting about 600,000 patients each year[9-10].Manifestations of (UTI) account for more than 7 million heath care visits and 1 million hospital admission annually in United States and The incidence of UTI is second only that of upper respiratory infection in primary care[11-13]. In this study, we aimed to to assess the students' knowledge of regarded preventive measures of UTIs, and to determine the association between socio- demographical data and their knowledge regarding prevention of UTI.

Methodology

Quantitative research, a "cross- sectional" study was carried out to achieve the objectives of study among the nursing college students. The present study was conducted in Mosul University at the College of Nursing. Aaccedental sample of (120) students (males and females) from the nursing college students, were included in the study. To assess students' knowledge the researchers construct questionnaire format which consisted of (16) questions: The researchers interviewed all students, and each student was given a time period between (10- 15) minutes to answer the questions. In order to a chive the study aim and objectives, the structured knowledge questionnaire toward the preventive measures of UTIs were given and filled questionnaires were obtained from the subjects, which is composed of two parts:- Part One: Demographic Characteristics Sheet that include information related to the students' demographical characteristics sheet which include (age, gender, marital status). While Part Two is a questionnaire concerned with data to assess the their knowledge which was consists of list of (16) items. Each item has three option yes, no, and uncertain. The researchers were used three points to measure each items of the knowledge sheet. (3) for the right answer (yes), (2) for uncertain answer, and (1) for the wrong answer (no). The general level of students' knowledge were divided into three levels according to the mean of score; poor level of knowledge were (less than 2), moderate level of knowledge ranges from (2 - 2.5), and good level of knowledge ranges from (more than 2.5 - 3). The SPSS (version 18) was used for the data analysis. The demographic characteristics of the study samples were reported by using descriptive statistics (frequencies, percentages, and mean). The mean of scores were compared by one sample independent t-test, and one-way ANOVA. The content validity of the knowledge test tool was established in consultation with a panel of (10) experts in different specializations. All of them agreed that the questionnaires were clear, relevant, and adequate. Minor changes were employed based on their recommendations and suggestions. Data were collected through direct interviews of the samples, by using a constructed questionnaire to the period from 25st January, 2019 to 25th of May, 2019.

Results

According to table (1), out of (120) participants (40.8%) of respondents their age were range from (20-22) years old. In relation to gender, more than half of them (55%) were females. Regarding to the marital status that (86.7%) of the samples were single. Table (2) presented that the overall (52.5%) of the (120) participants had moderate knowledge, while (10.8%) of them had poor knowledge regarding preventive measures of UTIs. Table (4) indicated that there are no significant differences between students' knowledge in regard to their age and marital status respectively.

Table (1): Distribution of the studied students' level of Knowledge regarding preventive measures of UTIs.

Level of knowledge	Mean of score	Frequency	Percentage
Poor	>2	44	36.70%
Moderate	2 - 2.5	63	52.50%
Good	More than 2.5 – 3	13	10.80%

Table (2): Distribution of the samples according to their knowledge regarding preventive measures of UTIs.

No.	Preventive measures items	Mean of Score	(SD)
1	Bathing in the swimming pool increase UTI.	1.97	0.90249
2	Bathing by shower reduce the incidence of UTI.	1.98	0.90733
3	Cleaning the perineum from front to back after defecation reduce UTI.	2.58	0.78412
4	Use deodorant as a preventive measure to prevent UTI.	1.95	0.8638
5	Urination 4-5 times reduces UTI.	2.38	0.87143
6	Drinking liquids other than water decreases UTI.	1.9	0.83006
7	Use berry juice as a preventive measure to lessen the injury of UTI.	1.65	0.87591
8	Vitamin C reduce the risk of UTI.	1.98	0.90733
9	Avoid tight underwear lessens injury of UTI.	2.35	0.87731
10	Cotton underwear diminishes UTI.	2.36	0.85929
11	Emptying the bladder completely by repeating urination.	2.52	0.72137
12	Urinate immediately when felling bladder full.	2.45	0.75426
13	Pee before going to bed.	2.35	0.82656
14	Reduce the intake of hot, spicy foods.	1.88	0.63753
15	Emptying the bladder completely by repeating standing upright in the bathroom.	1.7	0.72876
16	Drinking enough water regularly daily reduce the incidence of infection.	2.51	0.67343

Table (3): Association between student' knowledge with selected demographic variable.

Variable	Sum of Square	DF	Mean Square	F cal.	F tab.	Sig.
Age						
Between Group	0.256	2	0.128			
Within Group	8.679	117	0.074	1.723	3.07	0.183
Total	**8.935**	**119**				
Marital Status						
Between Group	0.051	2	0.025			
Within Group	8.884	117	0.076	0.333	3.07	0.718
Total	**8.935**	**119**				

Table (4): Differences in students' Knowledge regarding gender.

Gender	No.	Mean	SD	T cal.	T tab.	Sig.
Male	54	2.1551	0.27891	-0.211	1.98	0.907
Female	66	2.1657	0.27199	-0.21

Discussion

There is no doubt the urinary tract infection it is consider the common problem which are affected in male and female[14,15]. We as a health care provider we must be educated the community to how deal with that disorder to preventing complication. In general, about 50% of clinical training should take place in the nursing school curriculum.[16] In recent study objectives the researchers assess the effectiveness of knowledge and examined it they focus on engagement and motivation as necessary factors for knowledge gain and learning transfer, relation

between learning outcomes and behavior.[17] According to study findings the participants distributed depending on demographic characteristics of respondents their age, In relation to samples gender and regarding to the marital status. All these variables putting to election to know what are the factors which are influencing into their knowledge. In table (1) we divided the level of knowledge in three categories good,moderate and poor, the,majority of participants had moderate knowledge toward preventive urinary tract infection because a good relationship for sample with their friends. Peer support and good relationships with peers are considered as factors contributing to a positive learning attitude [18,19].

The students in the present study were also willing to learn, which will support academic self-efficacy in their learning environment. Since healthcare professions are based on both theoretical knowledge and practice, candidates of healthcare professionals have to receive education in the clinical environment integrated with theoretical courses. It is important for students to actively participate in healthcare services.When we discuss the table (2) the analyses revile in details the method of preventive urinary infection, however the researcher show the variations between it, some of them was poor and another was moderate The studies demonstrated that time management training programs generally increased students time management skills and the copying time pressure [20]. The curriculum for the undergraduate nursing students education is appropriate to the age, social, culture and environment of students [21]. In table (3 and 4) the researchers thought the marital status and gender of sample play the important role to enhancing the background of the precaution and preventive of infection,There are several important areas of UTImanagement that are beyond the scope of our study . The management of UTI in pregnancy is not covered here in great detail, asthis is an area that is typically managed during prenatal care. Other areas beyond the scope of this document include long-term prophylaxisof UTI as well as acute or chronic prostatitis and UTI in pediatric patientsmany article demonstrate the a highly percentage of urinary infection was in female while there is no significant between male and female knowledge [22]. This study was concluded that (40.8%) of respondents their age was between (20 - 22) years old, most of them (66%) were females, and (86.7%) of the samples were single. More than half (52.5%) of the (120) participants had moderate knowledge, while (36.7%) of them had poor knowledge regarding preventive measures of UTI.There are no significant differences between students' knowledge regarding their age and marital statusrespectively. Thereis no significant differences in students' knowledge scores in regard to gender. Based on the results of the study, the researchers recommended the necessary to preparation of educational programs for students of the university of Mosul to develop their knowledge about the seriousness of UTI diseases, as well as the establishment of units for counseling and health guidance.

Impact of Educational Program on Nurses' Knowledge toward Coronary Artery Bypass Graft Surgery in Mosul Teaching Hospitals

Tahsein Muhsin Hussein[1], Myasar Mohsin Azeez[2], Radhwan Hussein Ibrahim[3]

[1]Lecturer, Adult Nursing, College of Nursing, University of Mosul, [2]Assistant Lecturer, Nursing Department, Technical Institute, Mosul, [3]Professor, Community Health Nursing, College of Nursing, University of Mosul

Abstract

Background: Coronary artery bypass grafting (CABG) is a common surgery to treat coronary artery disease which is the leading reason of death in advanced countries. It involves a section of a vein or an artery to produce a connection (or bypass) between the aorta and the coronary artery beyond the obstruction.

Objectives: The objectives of the study were to assess the nurses' knowledge toward CABG, to identify the impact of the educational program, and to determine the relation between nurses' knowledge and their demographical characteristic.

Method: A quasi-experimental study was conducted to assess the effectiveness of educational program on nurses' knowledge regarding to CABG. A non-probability purposive sample consisting of (40) nurses. The samples were divided into two equal groups (study and control). An educational program was focus to administer for the study group. All participants completed a self-administered instruments at pre and post-tests. The assessment was carried out during the period from 17th of January, 2018 to 4th of May, 2018. The Instrument validity was determined through content validity, by a panel of experts.Reliability of the instrument was determined through the use of test- retest approach.

Results: The results revealed that the mean post- test knowledge scores in the study group were significantly higher than mean pre- test knowledge score.

Conclusion: The study concluded that the educational program had great effective on emerging and enhancing nurses› knowledge regarding CABG.

Keywords: *Coronary artery bypass graft, educational program, nurses knowledge.*

Introduction

Cardiovascular disease is the prominent cause of death worldwide, accounting for 31% of all recorded deaths, and is expected to continue in this point until 2030[1,2]. The most common of these is the coronary artery disease which represents the leading cause of death in developed countries[3,4,5]. Today, coronary artery bypass surgery (CABG) remains one of the most generally done main surgical treatment worldwide and the most common procedure performed by cardiac surgeons[6,7,8]. This surgery has supported to be one of the most effective and lasting therapies for ischemic heart disease[9,10]. Coronary artery bypass surgery is a surgical method which may be uses arteries or veins as a graft to convey blood to an area of the coronary artery distal to the blockage[11,12]. A coronary artery bypass surgery (marked" cabbage")[13]. Coronary artery bypass graft surgery has a positive effect on mortality in several cases[14]. American Heart association position statement specified that CABG is indicated if medical

management does not satisfactorily control angina in patients with coronary artery disease or if the patient has >50% obstruction of the left maincoronary artery or three vessel disease with moderate or severe left ventricular dysfunction regardless of symptoms[15]. Extra of 400,000 American (greatest of them male) undergo CABG every year, making it one of the most common cardiac surgeries. Successful CABG can relieve angina chest pain, progress cardiac function, progress the patient's quality of life, also they experience more active, exercise performance increases and support them to return to the normal lives, but the early recovery period presents a numeral of challenges for patients care and nurses[16,17,18]. In the US and an average incidence rate of (62) per 100,000 inhabitants in western European countries[19,20].Early and adequate discharge planning based on in-depth knowledge of the post discharge experience will help to ensure optimal recovery [21].

Method and Subjects

Quantitative research, a quasi- experimental study was carried out to assess nurses' knowledge in Al-Jamhuree and al- Salam Teaching Hospitals in Mosul City from 17th of January, 2018 to 4th of April, 2018. It was carried throughout the application of pre and post–tests approach for the study group and control groups. A non – probability purposive sample of (40) nurses (male and female) who were working in cardiac care wards, who met the sample criteria were included in the study, which was divided into two groups; the first group consists of (20) nurses for study group were exposed to the health educational program, while the second group (20) nurses for control group. Each group had proximately the same demographic characteristics as possible. To fulfill the objectives of the study aclosed-ended questions structured knowledge questionnaire was preparedbased on a comprehensive review of relevant literatures to evaluate the nurses knowledge before and after the administration of educational program. It consists of two parts:-Part One: Related to the nurses demographical characteristics sheet which include (age, gender, level of education, years of experience in cardiac wards, and number of attending educational programs regarding CABG).Part Two: Questionnaire to Assess Nurses› Knowledge Regarding CABG,this part involves of (20) items. All items were measured by nominal scale of normal which was given a score of two for the correct answer and one for the wrong answer. The knowledge mean of scores was rated into (3)knowledge levels, according to the two-point likert scale = (Maximum – Minimum)/groups= (2-1)/3 = (0.33) this is the interval value which was the added value to the three levels as in the following:1– 1.339 (Poor), 1.34–1.669(Moderate), and 1.67 – 2 (High). The tools validity was done by a panel of experts in different specializations, Reliability was tested by test-retest the correlation coefficient was (r=0.88%) at the level ($p \leq 0.05$) for nurses' knowledge. This indicated that the instrument was adequately reliable.All the results were analyzed using the statistical package SPSS 18.0. A statistical and inferential analysis was applied for data analysisconcentration on the calculation of the frequency, percentage, paired t-test, Pearson coefficient correlation, mean of score (MS), and one- way analysis of variance.A p value ≤ 0.05 was regarded statistically significant.

Results

Table 1: Comparative differences between the study and control groups of the nurses' knowledge relative to pre and post- tests.

Discussion

Throughout of the data analysis, In relation to the age, the results of the present study showed; that more than half of the nurses in both study and control groups belonged to the same age group of (30-39) years old. This finding is in concordance with that of[22] who found that their age ranged between 20 and 40 years. The high percentage of male nurses in the present study. The researcher refer to this finding which is due to the dominance of male in the nursing profession in Iraq. On the other hand, this results may be imitate a social conditions keeping women away in this job and due to the fact that most of female nurses are selected to care for maternal and child health care. This finding is disagree with a study done by[23,24], who definite that the majority of nurses were female. Moreover, the current study revealed that the institute nursing graduate were the high proportion, more than half of them their years of experience in cardiac wards less than (5) years and more than three quarters of them have no attendance in any education programs related to coronary artery bypass grafting. The above findings were consistent with another study done by[25], shown that nursing school diploma was the high proportion. Also, more than half

of them their experiences less than (10) years and the majority of them have no in service training course related to coronary artery bypass graft surgery. As well, Supporting to this findings[26] stated that the majority of nurses in both units had secondary diploma degree and most of nurses in both units had not trained.

In order to assess the effect of educational program upon nurses' knowledge through scoring analysis for mean of score. The findings of the current study had presented that, the mean of the nurses' knowledge score was (1.32, 1.31) for both study and control groups respectively during pre-test,which was reflects the poor of their knowledge before the administration of the educational program. After program implementation for the study group subjects, the nurses' knowledge mean of score was (1.81) had shown highly significant improvement in post-test when they are compared with control group (1.30). The above results indicated that the educational program was very efficient in enhancing the knowledge level of the respondents. This finding goes in with the previous study done by[27,28] whomentioned that nurses must be able to expand their knowledge of this area through ongoing education, Journal, and seminars. Consequently, teaching programs for nursing staff constitute an important part. These programs are urgently designed to assess nursing staff in developing and enhancing the skills needed to provide high standards of care to their patients.In this respect,[29]reported that many continuing education program evaluations use a comparison of the participant's pretest and post test scores as an indicator of that program's effectiveness. The results of the recent study indicated that the selected demographic variable had shown no statistical significant association with the nurses knowledge scores. This findings agree with another study done by[30] who revealed that the all demographic variables i.e. age, sex, educational qualification, experience in post-operative management of CABG and availability of any additional information on post- operative management of patient with CABG are not significant association between the pre- test knowledge scores and these selected demographic variables.

Conflicts of Interest: None declared.

Funding: There is no funding relevant to this study.

Ethical Clearance: Taken from Review Board of Ethical Research Committee, Mosul City for granting us the ethical approval for the study.

Acknowledgment: The authors wish to thank and acknowledge the members of the Review Board of Ethical Research Committee, Mosul City for granting us the ethical approval for the study. Finally, the study participants are highly appreciated for their valuable time and support.

Quality of Health Care System and Structure at Primary Health Care in Baghdad City

Tariq Yassen Taha[1], Wissam Jabbar Qassim[2]

[1]Ph.D.(c), Research Scholar, Universityof Baghdad, College of Nursing,
[2]Assistant Professor (PhD), University of Baghdad, College of Nursing, Community Health Nursing Department

Abstract

Background: Consumers satisfaction is the level of satisfaction that clients experience having used a service. This study aims to determine the level of quality of healthcare services in primary healthcare centers.

Method: The study included a simple random sample of beneficiaries of healthcare services in primary healthcare centers in the city of Baghdad by (5-8) beneficiaries for each center using a questionnaire to measure the satisfaction of beneficiaries with the quality of services and the use of the direct interview method, which took from (6-10) minutes.

The study results showed that customer satisfaction scale is very important to assess the quality of health services and can predict compliance and use of international standards for quality of services. The study also found that most primary healthcare centers are located in densely populated areas. Therefore, primary health care services are adequately provided.

Conclusion: The researchers concluded that most primary health care centers are located in densely populated areas. Therefore, primary health care services are adequately provided.

Keywords: *Quality of Health Care System; Structure; Primary Health Care.*

Introduction

Consumers satisfaction is the level of satisfaction that clients experience having used a service. It reflects the gap between the expected service and the experience of the service, from the client's point of view. Measuring consumer's or patient satisfaction has become an integral part of hospital/clinic management strategies across the globe. Moreover, the quality assurance and accreditation process in most countries require that the satisfaction of clients be measured on a regular basis[(1)].

Consumer's satisfaction with health services, therefore, has become one of the important components of providing accepted quality of care. Satisfaction has been said to be a major predictor of use of services, as it is essential if consumers were to utilize services, comply with treatments and maintain a continuing relationship with practitioners[(2)].

Satisfaction is the awareness of each person separately. These feelings plagiaristic by comparing expected service with perceived service[(3)].

Customer satisfaction is individual person reaction toward particular product when compare the performance of the product with any person expectation[(4)].

Customer satisfaction considered psychosomatic state reaction of customer when its emotion about expectations not positive in near future[(5)].

Consumer's satisfaction is the level of satisfaction that consumers experience after using the service. Thus, it reflects the gap between the expected service and service experience, according to the consumer's

opinion. Measuring consumer's satisfaction has become an integral part of strategies management of primary health care centers all over the world. Moreover, quality assurance and accreditation process in most countries to be measured consumers satisfaction on a regular basis[1].

Following this thinking, there has been growing interest in measuring consumer's satisfaction, mostly through collecting the views of service users. These views have become important in the evaluation of healthcare delivery and have become a tool for health service performance evaluation. Client satisfaction is now viewed as an important measure of protection against potential problems in healthcare delivery and is linked to changes in service delivery policies [6].

Essential healthcare is based on practical, scientifically sound and socially acceptable method and technology, made universally accessible to individuals and families in the community. It is through their full participation and at a cost that the community and the country can afford to maintain at every stage of their development in the spirit of self-reliance and self-determination[7].

The Approach to providing health care resources focuses on provision of essential health care using socially acceptable and affordable method and technology, accessibility, public participation in policy development, and intersects oral collaboration. The declaration of Alma Alta proposes a set of core activity to be included in primary health care and tailors to the needs of a particular population. These activities include:

1. Education to prevent and control major health problem in the area
2. Promotion of nutrition and a safe and sufficient food supply
3. Provision of safe water and basic sanitation
4. Provision of maternal and child health care, including family planning services
5. Immunization
6. Prevention and control of endemic diseases
7. Adequate treatment of common illnesses and injuries
8. Provision of essential medication [8].

Method

A descriptive "Evaluation Correlation" study was conducted to determine the Impact of Quality of Health Care Services on consumer's satisfaction at Primary Health Care Centers in Baghdad City. From (13th January to 5th March 2019).

A simple random sample consisting of (176) beneficiaries of health care services in primary health care centers in the city of Baghdad by (5-8) consumer's for each center using a questionnaire to measure the satisfaction of consumers with the quality of services and the use of the direct interview method, which took from (6-10)) Accurate. These centers are distributed into (2) sides and divided into (8) health sectors according to ministry of health directorate of primary health care. A total of (28) primary health care centers are selected for the purpose of the study.

The data collection starts with providers primary health care services in primary health care centers in Baghdad City. Utilizing of the developing questionnaires and the interview technique as means of data collection and keeping records of all available contacts that facilitate the access to study sample.

The reliability of the questionnaire which is determined through a pilot study and the validity are achieved through a panel of (17) experts. A pilot study was conducted among a convenient sample of (17) providers who were selected among persons concerning with primary health care centers. This preliminary Study was conducted from 15th December to 28th December 2018.

Results

No: Number, f: Frequency, %: Percentage, Iq D: Iraqi Dinar, χ^2= Chi-square, df: degree of freedom, p-Value: probability value, Sig: Significance, N.S: Not significant

A high percentage among age groups was associated with (30-39) years which is (30.7%), more of consumers are females (59.7%). The analysis of educational level for those consumers indicates that high percentage refers to primary school education (22.7%). The socioeconomic variable indicates that those consumers are associated moderate socio-economic status of (301000-600000 ID) (48.3%). Regarding occupational status, more than half of consumers are unemployed (56.8%). The types of services that are utilized by consumers were immunization (31.3) that presents the highest percentage followed by the services of assessment and treatment (25%), dental care (17%), childcare (13.6%) and maternal and child health (10.2%).

Table 2. Evaluation the consumers' satisfaction for healthcare services (N=176)

Satisfaction items	M.S	Evaluation
In general, I am satisfied with the quality of service provided at the center	2.53	High
Feeling safer if treated at this center	2.61	High
Satisfied with the communication and coordination between medical and health staff at the center	2.64	High
Satisfied with the attention of the medical and health personnel and health to your problem	2.68	High
Satisfied with the relationship with the service provider (medical and health staff)	2.68	High
Generally satisfied the time you spent at the health center to receive services	2.44	High
Satisfied with the health center near the place you live	2.64	High
Feel good about diagnostics and treatment costs in the health center	2.67	High

Satisfaction items	M.S	Evaluation
Satisfied with the efficiency of the medical and health staff in the health center	2.59	High
Feel good about respecting medical and health staffs	2.70	High
Feel good about medical and health personnel to clarify the problem understandable manner	2.38	High

Mean of score, Low= 1 -1.66, Moderate= 1.67-2.33, High= 2.34-3

Consumers' are highly satisfied with the type and quality of services that are provided by primary health care centers evidenced by high mean of scores among all items of the scale.

Table 3. Overall evaluation consumers' satisfaction level for primary healthcare services (176)

Levels	f	%	M.S	SD
Low	4	2.3	2.69	0.510
Moderate	46	26.1		
High	126	71.6		
Total	176	100		

f: Frequency, %: Percentage, M.S: Mean of score, SD: Standard Deviation, Low= 11-18, Moderate= 19-26, High= 27-33

Consumers show a high level of satisfaction for the services provided at the primary health care centers (71.6%).

Discussion

Regard to discussing the Socio-demographic characteristics of consumers attending the primary health care centers as the number of consumers who have been taken into account in the quality of health services provided in primary health care centers in Baghdad City (176) table(4-6); the results showed that a high percentage of age groups was associated (30-39) years, average (30.7%), followed by the age group of (20-29) years, at a rate of (29.5%), and the lowest category (≤ 19) years, at a rate of (4%).

These results are consistent with a study conducted by [9]. The study included people from four groups in Baihsud District in Jalal Abad City, Afghanistan. The age was between (25-34) years at a rate of (33.4%).

Analysis of the educational level of these consumers indicates that a high percentage indicates education in primary schools (22.7%) Table (4-6). The reason high is because most of the views taken are women, and because most of the women are in the elementary or middle stage and leave the school, as the lower the educational level, the lower the health culture, and this will increase the health problems in the country, as well as increase the material and human burdens.

Whereas in Afghanistan there is a study similar to ours, but it was recorded that the educational level in which the highest level of illiteracy occurred, not read or write, was found that about two thirds of the participants were illiterate, at a rate of (61.6%). The overall literacy rate (38.5%) [10].

The socio-economic variable indicates that these consumers are linked to the moderate social and economic situation (301000-600000 Iraqi dinars) (48.3%) table (4-6). The Central organization for Statistics in the ministry of Iraqi planning, a whole survey the poverty level and the income rate for individual to the period of (2018-2020) showed the results of the poverty rate (10%), and the income rate less than (50%) is moderate in Baghdad City [11], these results give stability for study. we would like to point out that the level of individual income to helps in resolving many health problems and prevents the ignorance spread.

Regarding the occupational situation, more than half of the consumers are unemployed (56.8%) table (4-6), and these results are consistent with the evaluation of the Central organization for Statistics and the executive management of the poverty alleviation strategy in the Ministry of Planning [11].

The percentage of the unemployed reached (57.3%), For the whole society according to the above, the average economic activity of individuals aged 15-years and over (42.7%) with a difference in the ratio between men (29.7%) and women (13%). the unemployment rate for adults to the age group (15-24) years, when it reached (27.5%), and from 25 or more (29.8%).

The types of services that are utilized by consumers were immunization (31.3%) that presents the highest percentage followed by the services of assessment and

treatment (25%), dental care (17%), childcare (13.6%) and maternal and child health (10.2%).

All of the above explanation it is shown in table (4-6) has been the division of services based on a global scale in the quality of service provided to the consumer's in primary health care centers in the Baghdad City.

These results are consistent with thoughtful study by[12] in the Iraqi Institute for Economic Reform.

Providing services in the health care according to the felt needs of patients and clients is the most important to improving service provision to the primary health care system, there is no use to add values to the service so that it is not according to the requirements of the patient or the consumer.

This study was conducted in primary health care centers in Baghdad city, and the results showed that the degree of satisfaction of patients and consumer's about the services provided in primary health care centers that they are very satisfied with the type and quality of services provided by primary health care centers, which is evident from the high mean of scores among all (11) items of the scale, table (4-7-a).the highest item is number (4) (satisfied with the attention of the medical and health personnel and health to your problem) and number(5) (satisfied with the relationship with the service provider (medical and health staff) mean of score(2.68), and the lowest item of the high level is (11) (feel good about medical and health personnel to clarify the problem understandable manner), and total of mean of score.

The results of this study apply with a study conducted by (13) in India on the satisfaction of consumer's and patient's in primary health care centers and the results indicate (98%) are very satisfied. Also, a study in Thailand (77%) revealed a very satisfied [14].

According to the overall evaluation of consumer satisfaction with primary health care services, the results indicate that consumers are very satisfied with the services provided in primary health care centers (71.6%), and the results (26.1%) Moderate are satisfied.

Customer satisfaction has always been an important component when measuring health outcomes and quality of care in both developed and developing countries and is an important indicator of quality of health care. The literature has shown that satisfied customers are more likely to develop a good relationship with the health system, which leads to better compliance, continuity of care and ultimately better health outcomes. Identifying customer needs and assessing the health services provided is a starting point for a customer-focused approach to health care provision. Therefore, customer satisfaction is an important measure for assessing the quality of health services and can predict compliance and use. The function of health care services is to improve the health status of the population[15].

Conclusion

1. The Customer Satisfaction Scale is very important to assess the quality of health services and can predict compliance and use with international standards for quality of services.
2. The study found that most primary health care centers are located in densely populated areas. Therefore, primary health care services are adequately provided.

Recommendations: The researchers recommend (1) encouraging the continuous use of the customer satisfaction scale to maintain the achievements by assessing the quality of the primary health care services to reach the highest level of the international standards for the quality of services, (2) work to encourage the health care sectors to maintain plans to complete these projects in order to benefit from the largest possible number of the population from the services provided in the primary health care centers.

Conflict of Interest: The researchers confirm that there is no any conflict of interest.

Source of Funding: This study is self-funded.

Ethical Clearance: The researchers obtained the ethical approval from the University of Baghdad, College of Nursing.

Abstract

Background: Respiration support by mechanical ventilation is an important aspect in intensive care. However, it could induce complication as infection. Ventilator Associated Pneumonia (VAP) is the most common infection in patient with ventilator support. This infection have an impact to patient's length of stay and prognosis. VAP will be followed with inflamatory responses consist of elevation IL-6 level and lipid profile abnormality. Therefore objective evaluation for acute inflamation could be a tool to diagnose VAP early.

Method: This study is analitic observational with prospektif design, to know the relationship of IL-6 dan lipid profile (HDL and LDL) toward VAP incidence in 38 patient under Intensive Care treatment. Subject observed for 7 days and IL-6, HDL,LDL levels were examined in the day with ventilator and 48 hours after it.

Result: VAP occur in 23 subject (65,53%) from all population. IL-6 (1), IL-6(2) and Δ IL-6 levels have significant effect to VAP incidence. HDL (1), HDL (2), LDL (1), and LDL (2) levels have significant effect to VAP group. And Δ HDL and Δ LDL levels have significant effect to both group, VAP and non-VAP subjects.

Conclusion: IL-6, HDL and LDL level change have relation as predictor VAP incidence.

Keywords: *Ventilator, IL-6, HDL, LDL, VAP.*

Introduction

Ventilator Associated Pneumonia (VAP) is an infection that often occurs in patients using mechanical ventilators. VAP could lengthening of the patient's stay in the ICU as well as worsen the prognosis[1]. VAP is the second most common nosocomial infection and the first cause of death from nosocomial infections in critically ill patients. It incidence ranges from 5% to 67% of cases, and most of areimmuno compromised patients, postoperatively and geriatric patients. In USA, the incidence of VAP ranges from 2 to 16 episodes every 1000 days on the ventilator[2].

VAP is a lung infection, which will trigger inflammatory responses. Although VAP occurs without complications, smaller inflammatory reactions are triggered. Inflammatory responses due to infection are associated with increased levels of cytokines, including Interleukin-6 (IL-6) and Interleukin-8 (IL-8). IL-6 is a synthetic protein that induces acute phase hormones by the liver[3,4].

Changes in the lipid profile are influenced by changes in lipid metabolism in patients with acute inflammation that are related to the severity of the underlying disease in the patient[5]. In infections, lipopolysaccharides (LPS) and pathogenic fats are covered by HDL-C (High Density Lipoprotein), LDL (Low Density Lipoprotein) and Very Low Density Lipoprotein. And, HDL-C in particular has the highest affinity for LPS[6]. Interleukin 6, along with several other cytokines also influence HDL levels through modification of triglycerides lipase. It shows that pro-inflammatory cytokines play a role in inhibiting the activity of lipoprotein lipase (LPL) and increasing the activity of Endothelial Lipase (EL), both of which are associated with low HDL levels during acute or chronic inflammatory inflammation[7]. Endothelial lipase (EL) is known as a member of the lipoprotein lipase gene family which is hydrolyzes HDL phospholipids and reduce HDL cholesterol level. Therefore, inhibition of EL can increase HDL. And EL is one of the important enzymes in the regulation of HDL metabolic physiology[8].

This study is aimed to find an association between IL-6 and lipid profile as predictors of VAP events.

Material and Method

This study was an observational analytic with a prospective design, to determine the relationship of IL-6 levels and lipid profiles (HDL and LDL) as predictors of VAP incidence. It conducted at Regional Hospital in Indonesia from January to April 2020. All patient met inclusion criteria were observed daily for signs and symptoms of VAP according CDC diagnose criteria 2010. There are two point of profile lipid and IL-6 examination. The first is after intubation and ventilator support and the second is after 2 days of ventilator support. All patient observed for day-1 to day-8.

Results and Discussion

This study was approved by the Research Ethics Committee of the RSUD Dr. Soetomo Surabaya.There are 37 patients met the study inclusion and exclusion criteria. All subject charateristics and diagnose are decribed in table 1.

This study shows there are 23 patient diagnosed for VAP (60,53%) from study population. It consist of 18 male and 5 female. These VAP patient are treated in ICU (5 patients), Resucitation Room (RES) (3 patients) and Intermediet Observation Room (ROI) (15 patients).

Table 1. Subject Characteristics

	VAP		Total	P value	RR (CI95%)
	Yes (n=22)	No (n=15)			
Gender					
Male	18(69,2%)	8(30,8%)	26	0,157	1,66(0,81-3,4)
Female	5(41,7%)	7(58,3%)	12		
Unit					
ICU	5(71,4%)	2(28,6%)	7		
RES	3(33,3%)	6(66,7%)	9		
ROI	15(68,2%)	7(31,8%)	22		
Age					
Mean ± SD	49,8±11,2	43,5±11,9	47,3±11,76	0,114	1,05(0,49-1,12)
Diagnose					
Perforated Appendicitis			1		
Hematothorax			1		
Metabolic Acidosis+ CKD			3		
Pulmonary Edema+ CKD			4		
Severe Brain Injury			4		
Coronary Artery Disease			2		

	VAP		Total	P value	RR (CI95%)
	Yes (n=22)	No (n=15)			
Pulmonary edema+ Eclampsia			4		
Intra Cerebral Hematoma			7		
Severe Pre-eclampsia			3		
Myastenia Gravis			4		
Guillen-Barre Syndrome			2		
Phlegmon			2		
Peritonitis			2		

The difference value (Δ) of IL-6 obtained 18.9 ng/L (1.8 - 188.5 ng/L) in the VAP case and Δ IL-6 value was -1.6 ng/L (-22.9 - 1 ng/L) in non-VAP cases (p value <0,0001) with a correlation coefficient of 1,000. The Δ HDL values obtained -19 mg/dL (-32 - (-5) mg/dL) in VAP cases and Δ HDL values of -1 mg/dL (-2-2 mg/dL)(p values <0, 0001) with a correlation coefficient of 1,000. The Δ LDL value is -27 mg/dL (-61 - (-11) mg/dL) in the VAP case and the Δ LDL value is -1 mg/dL (-3-3 mg/dL) (p value <0,0001) with a correlation coefficient of 1,000. All of these value described in table 2.

Table 2. Relationship of different value (Δ) IL-6, HDL, LDL with VAP incidence

Nilai Δ	Kejadian VAP		Nilai p	Koefisien Korelasi	RR (CI 95%)
	Ya	Tidak			
IL-6	18,9(1,8–188,5)	-1,6(-22,9–1)	<0,0001	1,000	NA
HDL	-19(-32–(-5))	-1(-2–2)	<0,0001	1,000	NA
LDL	-27(-61–(-11))	-1(-3–3)	<0,0001	1,000	NA

As described earlier, in this study we examine two times, first we do ata the first time patient supported with ventilator(value 1) and the the second is when patients already supported by ventilaor for two days (value 2). The value of of these examination described in table 3.

Table 3. Relationship between IL-6, HDL, and LDL value with VAP incidence

	Nilai 1[a]	Nilai 2[b]	Nilai p
VAP (+)			
IL-6	14,25 (2,3 -35)	42,4 (6,1-202,7)	<0,0001*
HDL	35 (16-52)	12 (7-31)	<0,0001*
LDL	80 (43-98)	47 (14-79)	<0,0001*
VAP (-)			
IL-6	51,8 (11,1-92,30)	41,20 (10,7-92,0)	0,003*
HDL	51 (13-54)	52 (12-54)	0,08
LDL	93 (42-98)	93 (42-96)	0,273

[a]: examintaion at the first time supported by ventilator, [b]: examination after 2 days of ventilator support

VAP in patients, especially critically ill patients, is a disadvantage. This will worsen patient's prognosis and increase his morbidity and mortality. Early recognition and detection in critically ill patients can reduce the riskto VAP incidence. In Intensive Care Unit (ICU), The observations of VAP signs and symptoms are carried out routinely especially when the ventilator is used for more than 48 hours or 2 days. Therefore, VAP condition can be recognized early to prevent further complications which will worsen patient's critical condition. However, it implementations become difficult due to the severity of patient's condition in the ICU. Therefore, we need an objective sign that helps in establishing the diagnosis of VAP in patients at risk. In this research, HDL and LDL and IL-6 levels were used as markers for the VAP incidence.

In prospective study of 44 ventilated patient, it is concluded that IL-6 values are significantly different cytokines in patients with confirmed VAP compared to other types of cytokines. In addition IL-6 was found as a fairly high risk predictor of VAP with a high sensitivity and specificity value[4]. In a retrospective study, it was found that IL-6 values of more than 100 pg/mL on the first day of patients on ventilator were predictive for infectious complications in patients with ventilators, mainly lung infections and associated with increased mortality. This is related to the inflammatory response to the course of infection that begins to arise which in this case is a complication of infection due to ventilator or VAP[9].

Interleukin 6, along with several other cytokines also influence HDL levels through modification of triglycerides lipase. It shows that pro-inflammatory cytokines play a role in inhibiting the activity of lipoprotein lipase (LPL) and increasing the activity of endothelial lipase (EL), both of these are associated with low HDL levels during acute or chronic inflammation[7]. Endothelial lipase (EL) is known as a member of the lipoprotein lipase gene family which is hydrolyzes HDL phospholipids and lowers HDL cholesterol level. So that inhibition of EL could increase HDL and EL is one of the important enzymes in the regulation of HDL metabolic physiology[8]. In serum, LPS which is an endotoxin in gram-negative bacteria is predominantly bound to VLDL and LDL, via LDL receptors. This results in inactivation of LPS. Then LPS is quickly taken by hepatocytes to be delivered into peripheral cells[10].

Conclusion

This study found that the examination of IL-6, HDL and HDL have potential as predictor of VAP incidence, so serial examination of these biomarker could detect VAP earlier to minimize it's complication and improve patient prognosis.

Saliva of Tobacco Smokers a Profile of C3, IgA, Amylase and Total Protein

Zahraa Hussein M. Kadri[1], Hazima Mossa Alabassi[2], Ahlam Jassim Taher[2]

[1]Ass. Lecturer, [2]Ass. Prof., Department of Biology, College of Education for Pure Science (Ibn Al-Haitham), University of Baghdad, Iraq

Abstract

Objective: The present study aimed to shed light on the role of narghileh and cigarette smoking on immunity status of oral cavity by assess (C3 complement component, Immunoglobulin A, Total protein, α-Amylase and EBV IgG antibody).

Method: Saliva levels in two smokers groups the first include 28 narghileh smokers and the second include 32 narghileh and cigarette smokers as well as 30 non-smokers consider as control.

Results: As compared control, the levels of C3, IgA and total protein were significantly decreased, and the highest decreased was observed in saliva of narghileh and cigarette smokers, the result was (C3= 0.400 ± 0.194µg vs. 9.728 ± 3.561µg; IgA= 2.460 ± 0.492mg/dl vs. 5.048 ± 0.937mg/dl; Total protein= 170.20 ± 45.93mg% vs. 452.20 ± 136.57mg%, respectively) while the level of α-amylase was slightly dropped but with a non-significant, the result was (246.37 ± 122.47,243.56 ± 178.69 vs,213.51 ± 101.88) respectively.

Conclusion: The narghileh and cigarette can alter the microenvironment of oral cavity and influence the immunity of mucosa tissue, then increase the risky for many diseases such as blood hypertension, heart diseases, and lung diseases and may contribute to a variety of cancer.

Keywords: *Smoking, complement component, total protein, amylase, EBV.*

Introduction

Narghileh, argileh, hookah, shisha, hubble-bubble, water-pipe and goza all of these nomenclatures refer to the same way of smoking. Narghileh is an old habit that has been use for 400 years, created in Asia and India. Narghileh smokers are exposed to many carcinogenic compounds toxic materials like nicotine, carbon monoxide, heavy metals and many toxic materials depend on puffing time, number of puffs and smoke inhalation[(1)].

Smoke inhalation has also been associated with elevation in the total white blood cells count, platelet activation and increased expression of proinflammatory cytokines (IL-6 and TNF-alpha) in the bronchoalveolar lavage fluid. A study performed by researchers Al-sawalha and his coworkers in 2017 on a mouse model showed an association between narghile and airway inflammation and it raises blood pressure and heart rate so this may increase the risk of heart attack and stroke and may contribute to a variety of cancer, heart disease and lung diseases[(2)].

Saliva as obtained from the oral cavity is a mixture containing the contribution of the various salivary glands, the oral tissues microorganism, and ingested substance, optimum PH is 8.57. It has many important roles; the most important one is the protection of oral environment from the numerous microbes that constantly exposed to through our mouth. Plasma B cells reside in the salivary gland and produce IgA antibody which is the common saliva Immunoglobulin, proline-rich protein, cystatins lysozyme, salivary amylase, peroxidase, and cationic peptides (i.e defensine, lactoferrin, and cathelcidine). IgA is the major class of salivary antibodies which constitute about (80-90%) of the salivary antibodies[(3)].

Salivary lysozyme can influence human granulocyte and lymphocyte function it seem to be active against bacteria, fungi and exerts antiviral properties as well as may induce lysis of tumor cells[(4)], α-amylase is a

highly abundant protein in saliva that perform a direct inhibitory effect on the growth of certain bacteria [5], and may also exert virus inhibitory properties. α-amylase initiate the digestion process in oral cavity and modulate the bacterial growth and adhesion on intraoral surfaces and it is consider as a physiological marker [6]. As well as complement function can be enhanced when meet saliva at the gingival margin, the potential of the complement system by saliva may play a role in neutralizing certain viral infections on mucosal surface. In addition increase or decrease saliva biomarkers contribute directly to describing the oral health also for diagnosis and monitoring oral diseases or prognosis for many systemic diseases in the future [7].

EBV is an orally transmitted human herpesvirus that infect epithelial cells and establishes latency in memory B lymphocyte .EBV exhibit a biphasic life cycle it's dual tropism for B lymphocyte and epithelial cells, which allow the virus to be transmitted within oral lymphoid tissues. The ability of EBV to immortalize B cells and its prevalence in a subset of cancer has implicated EBV as a carcinogenic cofactor in cellular context where the viral life cycle is altered .Conferring malignant phenotype observed in EBV –positive cancer. Given that oral cavity serve as the main site of EBV residence and transmission [8].

The topic of this study is to evaluate the important saliva component that may contribute to maintain oral immunity in narghile smokers.

Materials and Method

Subjects and saliva samples: A total of 90 Iraqi (healthy males) aged (18-25) years. They were distributed in to two groups the first include 28 Narghileh smokers, the second include 32 Narghileh and cigarette smokers as well as 30 non-smokers (control). Individuals in the study were fasting and asked to drink water. After ten minutes saliva samples were collected by spitting into a sterile universal tube. The samples centrifuged for 10 minutes at 4000 RPM and collected saliva were frozen at -80°C until assessment[9].

C3, IgA and total protein were determined by means of Automated Biosystem A15 while α-amylase were determined in saliva using (Human α-amylase; K LAB) kit. EBV IgG antibody was determined by means of ELISA using commercially available kits (Human EBV VCA IgG; IMMUNOLAB GmbH).

Data Analysis: The statistical analysis was performed using SPSS version 13. Their data were given as mean ± standard deviation (SD.), and differences between means were assessed by ANOVA, and then followed by LSD or Duncan test A p-value of ≤0.05 was considered a significant.

Results and Discussion

Numerous studies related to oral health among narghile smokers have been done to evaluate the effect of cigarette and narghile smoking on oral health among the practice people particularly youth, our study is one of these studies which aimed to the same target.

In this study different salivary constituent were assessed in saliva of narghile and cigarette smokers these factor included (C3, IgA Ab, total protein, α-amylase and specific IgG EBV Ab). As shown in table 1, which reveal the saliva level of C3 complement component in the three understudying groups (Non-smokers; NS, Narghile smokers; NAS and Cigarette smokers; CS) respectively the result of mean ± SD. was (9.728 ± 3.561, 3.60 ± 3.082 and 0.400 ± 0.194μ/ml) respectively.

Table 1: C3 level in saliva of smokers and non-smoker

Groups	C3 (micrograms/ml)		
	Mean±SD	Minimum	Miximum
Non-smokers (No.= 30)	9.728 ± 3.561^{C}	4.80	15.00
Narghileh smokers (No.= 28)	3.608 ± 3.082^{B}	0.80	9.00
Narghileh and Cigarette smokers (Mo.=32)	0.400 ± 0.194^{A}	0.12	0.64

*Different letters represent significant difference between means in columns ($P \leq 0.05$).

The result revealed a highly significant decreasing among the three groups particularly between Non-smokers vs. (Narghileh smokers & Cigarette smokers) $p<0.05$. our finding is disagree with study performed by Frial G. at 2008 which recorded an increasing level for both (C3 & C4) complement component in smoker groups compared with control [10].

A study carried out by Kew (Kew et al. 1985) [11] which also recorded an increasing level for C3 complement component, this finding explained by Kew who said that the increasing of complement serum level may related to the incorporation between smoke and C3 so the thioester bond may be intact, then he suggested that aqueous whole cigarette smoke solution can modify C3 and activate the alternative pathway of complement system. Furthermore a study which performed by (Alabassi and Al Nadawi 2020) [12], revealed an elevation in complement component C9 serum level in asthmatic patients exposed to smoking the result was (118.08 ± 5.45 pg/ml) as compared to control (94.47 ± 6.29pg/ml) while patient not exposed to smoking recorded a significant ($p<0.05$) complement C9 serum level (104.61 ± 2.64pg/ml) as compared to smoke exposed control which recorded (80.07 ± 2.25pg/ml).

The conflict between the finding of the present study with previous studies may related to type of specimen used in our study, Frial [10], Kew [11] (carried out their study on serum sample while the present study was carried out by using saliva samples. And the explanation of decreasing C3 saliva level may contribute to the depletion of C3 in plasma and tissue as a consequence of the activation of alternative complement pathway of the narghile smokers. In regard to IgA saliva level, the present study recording a significant decreasing of IgA saliva level among the three understudying groups and the highest lowering in the third group (narghile and cigarette smokers). Table 2 -demonstrate the IgA saliva level in three groups (NS, NAS and CS). The mean ± SD. was (5.048 ± 0.937, 3.560 ± 0.038 & 2.460 ± 0.492 mg/dl) respectively. There was a significant decreasing among the three understudying groups $P\leq0.05$. This finding is agree with previous studies (Sahib and Radhi 2018) [13] which observed a decreasing IgA saliva level, this decreasing may related to the effect of tobacco that may lead to impairment of body immune function. In addition to the impairment of Ag mediating signaling of T cell leading to immunosuppression.

Table 2: IgA level in saliva of smokers and non-smoker

Groups	IgA (mg/dl)		
	Mean±SD.	Minimum	Miximum
Non-smokers (No.=30)	5.048 ± 0.937^{C}	4.00	6.11
Narghileh smokers (No.=28)	3.560 ± 0.0381^{B}	2.90	4.00
Narghileh and Cigarette smokers (Mo.=32)	2.460 ± 0.492^{A}	1.80	3.00

*Different letters represent significant difference between means in columns ($P \leq 0.05$).

Table 3: Total protein level in saliva of smokers and non-smoker

Groups	Total protein (mg%)		
	Mean±SD	Minimum	Miximum
Non-smokers (No.=30)	452.20 ± 136.57^{C}	212.00	600.00
Narghileh smokers (No.=28)	306.20 ± 70.872^{B}	194.00	411.00
Narghileh and Cigarette smokers (Mo.=32)	170.20 ± 45.93^{A}	117.00	221.00

*Different letters represent significant difference between means in columns ($P \leq 0.05$).

In respect to the total protein saliva level, and as shown in table 3, this research finding record a significant decreasing of saliva total protein among the three understudying groups the result was (306.20 ± 70.872 and 170.20 ± 45.93 mg%) respectively as compare to non-smokers (452.20 ± 136.57mg%). This finding was disagree with study carried out by (Zainulabdeen and Alak 2014) [14], which recorded a high elevating total

serum protein in smokers vs. non-smokers. The conflict between our results may relate to the type of specimen. Also the decreasing of saliva total protein is parallel to the decreasing of saliva constituent which recorded decreasing in this investigation.

As shown in Table 4 the saliva level of α-amylase enzyme recorded a non-significantly increasing among the three groups P≤0.05 and result was (213.51 ± 101.88, 246.73 ± 122.47 and 243.56 ± 178.69 U/L) respectively. This finding is agree with the previous research in which the reduction of amylase activity of serum narghileh smokers is most probably due to the interaction between smoke aldehyde and SH-groups of the amylase molecule (Singh et al. 2018) [(15)]. Another study recorded a non-statistically significant difference in salivary α-amylase level between smokers and non-smokers this study is agree with the present study. While Greabu and colleagues (Greabu et al. 2007) [(16)] indicated that exposure to cigarette smoke decreased salivary amylase activities.

Table 4: Alpha-amylase level in saliva of smokers and non-smoker

Groups	α-amylase (U/L)		
	Mean±SD	Minimum	Miximum
Non-smokers (No.=30)	213.51 ± 101.88[A]	67.22	343.99
Narghileh smokers (No.=28)	246.73 ± 122.47[A]	130.48	470.52
Narghileh and Cigarette smokers (Mo.=32)	243.56 ± 178.69[A]	126.52	581.23

* Similar letters represent no significant difference between these means (P > 0.05).

The last finding of our investigation is the level of saliva IgG EBV antibody in narghile smokers. Table-5-revealed the+ve and –ve IgG EBV antibody in just two groups which were (NS & NAS) the result was obtained by using ELISA technique which revealed a slight distribution percent among the NAS. The result was (3+ve out of 27 –ve with distribution percent 11.11% for NS and 5+ve out of 23 –ve with distribution percent 21.73% for NS. A study performed by Chen and his coworkers (Chen et al. 2018) [(17)] who investigate the association between cigarette smokers infect with EBV and has nasopharyngeal carcinoma such pointed that cigarette smoking appear to be as risk factor of nasopharyngeal carcinoma (NPC) in people with+ve EBV IgA antibody but the association remain unclear. Furthermore Hodstrom and his coworkers (Hodstrom et al. 2020)[(18)] reported that smoking increases EBNA-1 antibody levels and acts synergistically with EBV infection to increase Multiple sclerosis risk.

Table 5: Positive and negative for EBV IgG in narghile smokers and non-smokers

Groups	**EBV IgG**	
	Saliva	**Distribution of EBV(%)**
Non-smokers (No.=30)	(3)+ve, (27)-ve	11.11
Narghileh smokers (No.=28)	(5)+ve, (23)-ve	21.73

Conclusions

- Based on our finding the percentage of EBV IgG Ab (21.73%) and despite the slight elevation compared to the non-smokers but still consider a risk factor of initiation the nasopharyngeal carcinoma.
- The lowering of immune constituent of saliva in oral cavity may enhance the reactivation of EBV infection that may induce the abnormal growth in nasopharyngeal tissue.
- Narghile smoking affect oral health, narghile and cigarette smoking can changing the microenvironment of oral cavity which may influence the mucosa tissue of oral cavity also may become a risk factor for many type of diseases

Anti-Islet Cell Antibody and Anti-ovarian Antibody Levels in Iraqi Women with Polycystic Ovary Syndrome

Zainab Ali Hlail[1], Ahmed Sahib Abd-ulamir[2], Khalil Ismail Abd-Mohammed[3], Mohammed Odah Salman[3]

[1]Lecturer, College of Medicine/University of Baghdad, Baghdad, Iraq, [2]Prof., College of Medicine/Al-Nahrain University, Baghdad, Iraq, [3]Prof. High Institute of Infertility Diagnosis and Assisted Reproductive Technology (ART)/Al-Nahrain University, Baghdad, Iraq

Abstract

Objective: The objective of this analysis was to assess serum islet cell anti-bodies concentrations and anti-ovarian anti-bodies in the relationship between the PCOS patient and the stable control group.

Material and Method: In this study, 250 Iraqi women aged between 20-50 years were studied. The patients were divided into two groups: study group (n=125, PCOS women) and age-matched controls group (n=125 normal women). The blood sample was obtained on the 2nd day of menstruation cycle. Islet cells Ab and anti ovarian Ab concentrations were determined in both groups.

Results: Women with PCOS had higher serum islet cell concentrations higher than control levels ($p < 0.05$). The levels of islet cells Ab and Anti-ovarian Ab were substantially positively associated with BMI, high levels of anti-mullerian hormone (AMH) and insulin resistance.

Conclusion: The evidence from this study indicated that serum Islet cells Ab and anti-ovarian Ab levels in women with PCOS were observed to be higher compared with controls. Elevated serum Islet cells Ab and anti-ovarian Ab levels can be associated with high AMH and insulin resistance.

Introduction

Islet cell autoantibodies are produced when beta cells of pancreas are damaged and they can bind to glutamic acid decarboxylase (GAD), protein tyrosine phosphatase, islet antigen-2 (IA-2), insulin, and zinc transporter (ZNT8) and lead to further destruction of islet cells of pancreas. The destruction of beta cells of pancreas causes hyperglycemia, which can be treated by insulin therapy to control hyperglycemia, but it leads to increase in weight gain as well as ovarian hyperandrogenism[(1,2)].

Islet cell autoantibodies react with islet cell antigens in particular sequence reacting with insulin or GAD first, followed by IA-2 and ZNT8. The sequence of autoimmunity to different islet cell proteins indicates that destruction of insulin producing cells is progressing in a particular sequence. These autoantibodies can be used to estimate an individual's risk of developing type I diabetes. Anti-islet cell antibodies reported in 83% of PCOS patients[(1)]. The first sign of a possible autoimmune endocrine condition is typically the regulatory hormone or an androgen secretory product. A large proportion of prematurity is associated with ovarian autoimmunity. Like normal menopause, premature menopause is associated with elevated FSH and decreased estrogen and inhibin B development[3)].

The study aimed to study and evaluate the serum islet cell anti-bodies concentrations and anti-ovarian anti-bodies in the relationship between the PCOS patient and the stable control group

Materials and Method

The study was conducted from February 2019 to January 2020. A total of 250 women with and without polycystic ovarian syndrome (PCOS) who were collected from the high Institute of infertility diagnosis Assisted reproductive technology (ART)/Al-Nahrain University. The history and all data were taken for each PCOS patients. The study was approved by the Institutional Review Board (IRB) of Baghdad University. Control: The control group was collected from healthy normal women.

Samples Collection: The first step was the collection of information from the patients, and then the second step was blood samples collection. Blood samples were collected from all the patients and controls, two milliliters of venous blood were collected in sterile screw cap plastic gel tubes.

Serum Separation: Serum was obtained from the blood samples were left for 30 minutes at room temperature, then centrifuge at 3000 rpm. For ten minute, then serum for each sample was collected in appendrof tubes and stored in deep freeze at -20°C until the time for using in ELISA technique for detection of islet cells Ab level and anti-ovarian Ab. The ELISA were collected acording to DRG-United state of America manufacturing.

Results

The level of serum islet cell antibodies (ICA) showed significant differences in PCOS patients in comparison with healthy control. The level was 1.92E2± 147.96 (Pg/ml), 84.04± 99.63 (Pg/ml) in PCOS and healthy control respectively. The serum level was ranging between 0 and 520 Pg/ml, table 1.

Table 1: Islet cell antibodies (ICA) level in PCOS patients and healthy control groups.

Serum ICA (Pg/ml)	Number	Mean	Std. Deviation	P-value
Patients	125	1.92E2	147.96	<0.0001
Controls	125	84.04	99.63	

*E2: ×100

The level of serum anti-ovarian Ab (AOAB) showed significant differences in PCOS patients in comparison with healthy control. The level was 2.12E2± 130.44 (Pg/ml), 92.37± 112.81 (Pg/ml) in PCOS patients and healthy control group respectively. The serum level was ranging between 0 and 520 Pg/ml, table 2.

Table 2: Anti-ovarian Ab (AOAB) level in PCOS patients and healthy control groups

Serum AOAB (Pg/ml)	Number	Mean	Std. Deviation	P-value
Patients	125	2.12E2	130.44	<0.0001
Controls	125	92.37	112.81	

*E: ×100

Discussion

This study showed high level of serum ICA in PCOS patients when compared with healthy control group. Islet cell auto-antibodies are produced when beta cells of pancreas are damaged[4]. The destruction of beta cells of pancreas causes hyperglycemia, which can be treated by insulin therapy to control hyperglycemia, but it leads to increase in weight gain as well as ovarian hyperandrogenism[5].

Auto-antibodies of islet cells respond with islet cell antigens in a complex sequence that first interacts with insulin or GAD. This pattern of autoimmunity to various proteins of islet cells suggests that in a specific series, degradation of insulin-producing cells is progressing. These auto-antibodies can be used to estimate the risk of an person developing type I diabetes[6].

Anti-ovarian antibodies (AOAB) have been detected in highly level in serum samples of women

undergoing of PCOS than healthy control women. Many past studies have shown that the presence of serum AOAB does not correlate with the clinical manifestation of PCOS. Despite these antibodies being present, their pathogenic role is highly questionable[7, 8]. AOAB may occur several years before the occurrence of clinical symptoms, as detected in 33-61% of women with unexplained infertility; a situation that may indicate early stages of autoimmune ovarian insufficiency[9]. For most autoimmune diseases, screening for specific antibodies is probably the best way of evaluating immunological involvement[10]. According to results of current research the syndrome could be possibly associated with some autoimmune diseases.

Gonadotropins can stimulate IL-1β and then it inhibits both LH and Human chorionic gonadotropin (LH/hCG) and FSH-stimulated progesterone and estradiol secretion by the follicular theca and granulosa cells, affecting cAMP production that suggests a follicle-stage dependent regulatory role of IL-1 on ovarian follicles[11]. A previous study demonstrated that the human granulosa-luteal cells express IL-1β transcript, and LH can stimulate this transcription in a dose-dependent manner, on the contrary, IL-1β significantly decreased LH-dependent estradiol production in these cells. Previous past results suggest that LH may exert its action on the steroidogenesis of granulosa cell, at least in part, the activation of the IL-1β gene[12]. In the brain, interleukin-1β can reduce the release of monoamines: serotonin (5-HT), dopamine and noradrenaline. The role of IL-1β in the monoamine metabolism in the basal ganglia can help for plasticity of anxiety and depression in the brain[13].

The Effect of Serum Estradiol Level at the Time of HCG Injection on the ICSE Outcome

Zainab Abd Alkathem Fatnan[1], Zainab Alkhafajy[2], Aseel Abdulameer Mohammed[3]

1Specialist OBG at Al Zahraa Teaching Hospital, Teacher at Kufa, Medical School, [2]Consultant OBG at Al Zahraa Teaching Hospital, Assistant Professor at Kufa Medical School, [3]Specialist OBG at Al Zahraa Teaching Hospital, Teacher at Kufa Medical School

Abstract

Background: In addition to multi-follicular development, controlled stimulation of ovaries is associated with a high serum level of estradiol (E2). The increased serum E2 level during COS may therefore be associated either with an increased chance of pregnancy or an impaired reproductive outcome secondary to changed endometrial receptivity.

Objective: To assess the effect of serum estradiol level at the day of hCG administration on the success of intracytoplasmic sperm injection (ICSI) cycles

Patients and Method: A retrospective study, in which a total of 235 women who were undergo a single ICSI cycle were introduced in this retrospective study, All patients were received gonadotrophin agonist either short or long protocol. The patients were classified at the day of hCG administration into three groups according to serum E2 level group A <1000pg/ml, group B 1000-3000pg/ml and group C >3000pg/ml.

Results: The mean number of retrieved oocytes and embryos obtained in group C were more than in group A and B but clinical pregnancy rate was higher in group B than in group A and group C which is statistically significant.

Conclusion: Although there is no high quality evidence to support a positive correlation between serum E_2 levels and IVF-ICSI products, the E2 level in the serum may has a level –dependent effect on the success of pregnancy. The optimal range of serum E2 is 1000-3000pg/ml is associated with higher rate of clinical pregnancy.

Keyword: *IVF-ICSI, Ovarian hyperstimulation syndrome, E2.*

Introduction

In contemporary IVF procedure, there is a positive correlation between retrieved oocytes and rate of live birth. Therefore, the live birth rate which based on obtaining enough mature follicles which contains critically well oocytes, may reflect the success rate [1, 2].

There are many method can be used to obtain a large numbers of follicles. In the past decade, many centers use the ovulation induction regimens, mainly those using gonadotropins and GnRH analogues. COH lead to achieve multiple oocytes, that result in supraphysiologic E_2 levels and this has a direct effect on endometrial implantation. Increased E2 concentration on the day of hCG injection have a positive effects on IVF-ICSI results or a low outcome, caused by endometrial receptivity disruption [3-6].

Many studies have reported that supraphysiological E_2 concentrations may affect the chance of pregnancy. On the other hand, an other studies suggest that high serum E_2 level have no effect on endometrial receptivity[5,7,8]. In the bases of these results, the effectiveness of high

E_2 levels on the day of hCG administration have controversial association, which in turn affect IVF-ICSI outcome. So we need to assess the association between E_2 levels on the day of hCG administration and IVF-ICSI outcome, in which GnRH analogues were used for down regulation

The aim of the study: This retrospective study was performed to assess the effect of serum estradiol level at the day of hCG administration on ICSI patients who were undergone controlled ovarian stimulation (COS).

Patients and Method

This study was performed in the fertility center of Al-Sader teaching hospital in Al-Najaf city.

From February 2018 to February 2019, (235) couples underwent ICSI cycles because of tubal, ovarian, male and unexplained infertility. Exclusion criteria for the study included the presence of known intrauterine anomalies and ovarian stimulation other than GnRH agonist protocol (short & long).

In cycle day 2-3 hormonal assay in form of (FSH, LH, Prolactin,and E2) done along with vaginal ultrasound was carried to identify the antral follicle amount and to eliminate the existence of ovarian cysts or other pelvic pathology and seminal fluid analysis for the partner reviewed then according to above results, stimulation protocol was selected. Patients were screened and were negative for infection with HIV, hepatitis B and C.

Stimulation Protocol: Gonadotrpin releasing hormone (GnRH) agonist used for all women. In the current study we used two main protocols;

1. **Long Protocol:** GnRh agonist (3.7 mg) was administered to suppress the pituitary gland on day 21 of the menstrual cycle (middle luteal phase). Vaginal ultrasound performed on day 2 or 3 of the next menstrual cycle to confirm the absence of any functional ovarian cyst larger than 10 mm. Gonadotropin stimulation consisted of 1-2 ampoules per day of recombinant FSH (Gonal-F^R, 75 IU). The initial dose was individualized according to the patient›s age, the reserve ovarian test was adjusted according to its response after the first 4-5 days of stimulation.
2. **Short Protocol or Flare-up protocol:** Involves agonist treatment (decapeptyl 0.1mg S.C daily) for 10-14 days started one day before or concurrently with ovarian gonadotropines stimulation and the dose of gonadotropines adjusted as the long protocol(as described above).

For both protocols, follicular development was examined by vaginal ultrasonography and serum E2 level starting from cycle day 8 or 9 and then every other day. At the day of human chorionic gonadotrophine (hCG) administration, serum levels of E2 were measured.

Serum concentration of estradiol (E2) was measured by (VIDAS measurement – ELFA technique (Enzyme Linked Fluorescent Assay) bio Meriexu sa/France).

Serum E2 level at the day of hCG administration were classified into three groups:-

A. (<1000pg/ml),
B. (1000-3000pg/ml),
C. (>3000pg/ml).

thirty- four to 36 hours following 10,000 IU of hCG administration, oocyte retrieval was performed under general anesthesia and by guided of transvaginal ultrasound. After aspiration, oocytes were screened and injected (ICSI). The fertilization rate calculated as (number of embryos obtained per number of injected oocytes). After embryo transfer, all patients were given luteal phase support using progesterone vaginal pessaries 400mg twice a day(Cyclogest ^{R}) Started at day of ovum pick up for 16 days and was continued if pregnancy occurred up to 10-12 weeks. After 2 weeks the serum level of βhCG was checked after embryo transfer, and clinical pregnancy was confirmed two weeks later by sonographic

Detection of the gestational sac and positive heart beat. Clinical pregnancy rate calculated as the number of women with clinical pregnancy per number of women that did embryo transfer.

Embryos were classified according to the number of blastomeres, percentage of fragmentation & blastomere appearance as type 1, 2, 3 or 4.

Regarding the equality of embryos, good quality embryos are those of grade 1 and 2, while bad quality embryos are those of grade 3 and 4.

Statistical Analysis: This study was analyzed statistically by using SPSS (statistical package for social science) version 20. In which we use chi sequare (x^2)

For categorical data and independent sample T-test for measurement data. We set P value <0.005 as significant.

Results

Table (1) shows demographic characteristic of the women according to E2 level in three groups were no significant difference in their age, BMI, endometrial thickness and hormonal assay (FSH,LH, E2 and Prolactin) hormone.

Table(1): Demographic characteristics according to E2 at HCG level in the studied group.

Characteristic	E2 at HCG			P value
	<1000 Mean±SD	1000-3000 Mean±SD	>3000 Mean±SD	
Age/years	30.45±6.4	30.5±5.7	28.6±5.6	0.104
BMI(kg/m^2)	27.7±3.1	27.3±3	27.1±3.4	0.576
FSH(IU/L)	4.2±2.3	4.1±2.7	4.2±1.7	0.716
LH(IU/L)	2±1.4	2.7±1.8	2.3±4	0.319
E2(pg/ml)	27.8±14.3	35.6±16.4	45.6±22.5	<0.001
Prolactin(ng/ml)	23.5±8.6	26.7±23.7	24.3±8.2	0.514

Table (2) shows the mean number of retrieved oocytes (p=0.001), no. metephase II oocytes (p=0.001) and number of embryos obtained (p=0.001) were significantly higher in group C than in groups A & B.

Percentage of metaphase were not statistically different among three groups (p=0.284).

Fertilization rate (number of embryos obtained per number of injected oocytes) was higher in group A (0.6067± 0.2469) than in group B (0.5170±0.2615) and group C(0.4330±0.2865) but it was not statistically significant (p=0.088).

Table (2): Demonstrates the comparison of the outcome according to E2 at HCG level.

Characteristic	E2 at HCG			P value
	<1000 Mean±SD	1000-3000 Mean±SD	>3000 Mean±SD	
No. of oocyte	6.1±3.6	9.4±4.8	13.1±6.2	<0.001
No. of M2	2.9±2	4.4±2.1	5.8±2.6	<0.001
No. of embryo	2±0.9	2.5±0.7	2.7±0.5	<0.001
Percentage of M2	52.7±23.4	50.1±17	47.3±14.1	0.284
Fertilization rate	0.606±0.246	0.517±0.261	0.433±0.286	0.088

Table (3) shows the types of protocols and type of infertility were not significantly different among the studied group. There is significant difference between <1000 and 1000-3000 and <1000 and >3000 while there is no significant difference between 1000-3000 and >3000

Table (3) The type of protocol and indication of ICSI according to level of E2 at HCG

Variable		E2HCGG			P value
		<1000	**1000-3000**	**>3000**	
Protocol	Long	924.3%	2156.8%	718.9%	0.385
	Short	3517.7%	10653.5%	5728.8%	
Indication	Female	1719.3%	4955.7%	2225.0%	0.980
	Male	2418.3%	7053.4%	3728.2%	
	Unexplained	318.8%	850.0%	531.2%	

Table (4) shows clinical pregnancy rate (calculated per embryo transferred) was higher in group B 49/127(37.8%) than in groups A 5/44(9.1%) and C 20/64 (29.7%). It was statistically significant (p=0.002).

Table (4): Relation between E2 HCG level and clinical pregnancy rate.

		Fertilization		P value
		Negative	**Positive**	
E2HCGG	<1000	39	5	0.002
		90.9%	9.1%	
	1000-3000	78	49

Total		**161**	**74**	
		69.8%	**30.2%**	

Table (5) regarding the quality of embryos, good quality embryos were more frequent in group B (113) than group C (57) and group A (38) this difference was not statistically significant.

Table (5): shows the comparison of the quality of embryos among three groups.

		Grading		P value
		Good quality	**Bad quality**	
E2HCGG	<1000	38	6	0.833
		86.4%	13.6%	
	1000-3000	113	13	
		89.7%	10.3%	
	>3000	57	7	
		89.1%	10.9%	

Discussion

IVF-ICSI is tried in the world very widely and controlled stimulation of the ovaries is very beneficial to achieve these outcomes. COH may improve the success of fertilization and lead to large number of embryos that can be transferred to mother to be happy with a nice and acceptable success rates [9.10].

In the present study the number of retrieved oocytes and number of mature follicles (M II) is higher in group C (E2>3000pg/ml) than group A (E2<1000pg/ml) and B (E21000-3000pg/ml), this mainly depends on appropriate follicular development in patients with high E2 level. [11]

The embryos, number that obtained was higher in B and C than in group A which is statistically significant, this result agree with Jones et al.,1983; and Dor et al., 1986.[12, 13]

Regarding the rate of fertilization there is no statistical significant difference were found in between group A, B and C although it is decrease with higher peak E2 level this also shown by previous study [6,13]. This result disagree with Chenentte et al., study in 1990 who found that the fertilization rate to be unrelated to the serum E2 concentration or the number of oocytes retrieved. [14]

Regarding pregnancy rate this study demonstrate that the pregnancy rate increase as serum E2 level increase up to 3000pg/ml and start to decrease when concentration rise >3000pg/ml, this outcomes are also obtained by Blazar et al., 2004[15] who conducted that the rate of pregnancy is become higher with increment in the peak of serum E2 and continue until plateau level is reached at nearly 2500pg/ml. this also showed by Mitwally et al., 2006.[16]

The is a study performed by Simon et al., 1995 and is found that there is impairment of implantation occur with a high serum estradiol concentration in spite of the presence of large number of oocytes. [17] This may caused by direct negative effect of increased estradiol concentration on endometrial receptivity by tissue and cellular damage because of alteration in the ratio of estrogen to progesterone as shown in recent study were serum E2level significantly correlated with the number of oocytes obtained (p=0.001).

There is evidence that optimizing serum E2 level on hCG administration may improve the treatment outcome after ICSI but that low or high E2level have negative impact. So, a good estrogenization of the uterus is important for preparing the uterus to implant the emberyo.

It also caught our attention that, in case with decreased E2 level on the day of hCG administration (<1000pg/ml) had pregnancy rate significantly lower than in group B and C respectively, this agree with study made by Ng et al.[12], this attributed to lower number of retrieval oocytes, number of metaphase II and ultimately embryos transferred as shown in table (2) is a possible cause for lower pregnancy rate.

The effects of E2 level on endometrial receptivity should be further evaluated in future studies.

Conclusion

We can conclude that the success of ICSI cycle is affected by serum E2 level. However, the extreme of serum E2 level associated with poor ICSI outcome.

Recommendation: Since the concentration of estradiol are at the ends of extreme level can affect pregnancy outcome, so we advocate the possibility of canceling such cycle and frozen embryo for transfer in subsequent fresh cycle. Nevertheless, larger randomized studies were recommended with large sample size and for longer duration of follow up to define appropriate protocols in clinical practice of ICSI cycle.

The Satisfaction of Patient with Respect to the Aesthetic and Phonetic of Removable Partial Denture Therapy for Iraqi Patient

Zainab Mahmood Al-Jammali[1], Anas Al-Yasiry[2], Zahra S. Abed Karkosh[3], Azad Almuthaffer[1]

[1]MD Lecturer Prosthodontics/College of Dentistry, University of Babylon/Iraq, [2]MD Lecturer Department of Basic Science College of Dentistry, University of Babylon, Iraq, [3]MD Assistant Lecturer Prosthodontics/College of Dentistry, University of Babylon/Iraq.

Abstract

Background: The purpose of the dental treatment is getting the satisfaction of patient, in addition to reestablish and improve oral health and functions. Negative effect on aesthetic and speech can produced from losing of teeth, so; substituting of losing teeth with suitable prostheses was mandatory for maintenance of oral health.

Method: The patients participated in this study were (160) with aRPD, sixty males and one hundred females, age range (30-60) years. After construction of the prosthesis, then ask the patients questions about aesthetic and phonetic after placement of RPD, and the satisfaction of patient was evaluated.

Conclusion: From the point of phonetic and esthetic of the denture, largest percentage of the female were very satisfy compared with the male. Non-significant differences between the age groups in respect of esthetic, while about the phonetic, the largest percentage of the younger patient was very satisfy compared with the older patient. The employed patient have largest percentage of satisfaction to the esthetic of the denture, while the non-employed patient have largest percentage of satisfaction to the phonetic of the denture .

Keywords: *Satisfaction of patient,esthetic, phonetic,removable partial denture, therapy, employment.*

Introduction

What is the purpose from the dental treatment? The purpose of the dental treatmentis getting the satisfaction of patient, in addition to reestablish and improve oral health and functions.[1] Negative effect on aesthetic and speech can produced from losing of teeth, so; substituting of losing teeth with suitable prostheses was mandatory for maintenance of oral health.[2] Loss of teeth, which may be due to trauma, dental diseases, pathology, or otherwise not only alters the psychological thought of the patients but also disturbs the esthetics, phonetics, and functional occlusion[3], Knezović *et al* (2001,2003,2008) was found that the satisfaction of patient affected by various factors such as: losing teeth numbers, aesthetics, retention, phonetic and oral hygiene habits.[4-6] The satisfaction of patient was correlated to aesthetic and phonetic of denturesin some patient, while mastication is more important in the other patients.[7-10] Phonetic and aesthetics value are extremely important factors which affect the satisfaction of patient level with their RPD, in certain patients, comfort and the ability to masticate were primarily related to the satisfaction of patients, while in the other retention and aesthetics are more important.[11] Also the satisfaction of removable prosthesis can be effected by mental attitude, patients personality, pastpartial denture experience.[12-14] Whereas the dissatisfaction of removable prosthesis can be effected by deposit of plaque, teeth caries, denture stomatitis and periodontal infection of teeth.[15-18] Furthermore, facial

appearance and personal communication for many people with others can be affected by aesthetic problem of the RPD.[19,20] The RPD has many advantages such as it was reversible treatment, the oral hygiene can be maintained easily, inexpensive, and it is consider non-invasive treatment line, on the other hand; several speech and aesthetic issues problems was associated with it.[21,22] So, the aim of this paperis to examine the relation between the level of satisfaction of RPD associated to phonetic and aesthetic of patients who looking for treatment at the Prosthodontics Department in the Collage of Dentistry in University of Babylon in Iraq and attempt to find its correlations with employment and because there are no available studies (to our knowledge) that have investigated the satisfaction of patient among subjects in Babylon region, this would be of valuable information to oral health planners for proposing strategies helping in the development of dental health care management in Iraq, as well as with gender and age.

Materials and Method

Study Sample: The sample included the patients who seeking for construct a new definite RPD treatment at the Prosthodontics Department in the Collage of Dentistry in University of Babylon in Iraq. Inclusion criteria the patients who have good oral and general health, without temporomandibular dysfunction syndrome,and physically handicapped patients should excluded and those who were incapable to take their own decisions about asked question that is related to the denture. After explaining the procedure steps and the aim of the study to all participant patients and allowing them to make their decision about participation and answer all the questions, we obtain the written consent with signature from them,the general information were taken from patient about name, age and gender. After construction of the prosthesis, we ask the patients questions about aesthetic and phonetic, and the satisfaction of patient was evaluated by using scale range from 1 to 5, (scale 1mean unsatisfied, 2 satisfy, 3 good,4 very good, 5 excellent).

Sample Size: The sample size at about (160) patients with a RPD, sixty male and one hunderd female, age range (30-60) years. The study period (October 2017 to March 2018).Subjects who took part in this study were divided into two age groups. The first age group include the patients who younger than 40 years, the second age group include the patients who are aged from 41 to 60 years.

Statistical Analysis: The data of this study is collected and analyze by Statistical Package for Social Science: Software, v. 21.0 (IBM Corp., Armonk, USA) Analysis of Interval Pearson's R Ordinal by Ordinal Spearman Correlation N of valid Cases, esthetic and phonetic for both sex and compared between them with the criterion level for statistical significance was set at ($p<0.05$).

Result

About the esthetic, table (1) showsthe relation between gender and esthetic, the largest percentage of the female were very satisfy (55%) with the esthetic of her denture compared with the male patients who have (16.7%), and the differences between the gender was significant ($p<0.05$). Among age groups, the largest percentage was for the first group (younger than 40 years) about (54.5%) was very satisfy compared with the second group(older than 40 years) about (33.3%) and the least percentage was recorded3 for the second group about (4.8%) was unsatisfied (tab2), also the differences between the age groups was non-significant ($p>0.05$).

The correlation between employment and esthetic,in table (3) it obvious that the largest percentage recorded in the employed patient (52.6% and 47.4%) were satisfied and very satisfied respectively compared with the non-employed patient who have (15.4% and 30.8%) were satisfied and very satisfied respectively.

About the phonetic, table (4) shows the relation between gender and phonetic, we see that the largest percentage recorded for the female patient (75%) was very satisfied compared with the male patients who have (41.7%) were very satisfied, there is no unaccepted patient about phonetic, and the differences between the gender was significant ($p<0.05$). Among age groups, the largest percentage was for the first group (younger than 40 years) about (81.8%) was very satisfy compared with the second group(older than 40 years) about (52.4%) (tab5).

Table(6) shows the relation between employment and phonetic, it obvious that the largest percentage recorded in the non-employed patient (69.2%) were very satisfied compared with the employed patient who have (57.9%).

Table 1. The relation between gender and esthetic

Gender	Severely dissatisfied (%)	Dissatisfied (%)	Neutral (%)	Satisfied (%)	Severely satisfied (%)
Male(60)	0	8.3	25	50	16.7
Female(100)	0	5	10	30	55
Mean= 4.13, SE =0.97, P-Value Less than0.05					

Table 2. Relation between age and esthetic

Ages	Severely dissatisfied(%)	Dissatisfied (%)	Neutral (%)	Satisfied (%)	Severely satisfied (%)
Less than40(66)	0	9.1	18.2	18.2	54.5
More than40(94)	0	4.8	14.3	47.6	33.3
Note: Mean= 4.53, SE =0.671, P-Value more than0.05					

Table 3. Relation between employment and esthetic

Employment	Severely dissatisfied(%)	Dissatisfied (%)	Neutral (%)	Satisfied (%)	Severely satisfied (%)
Employee	0	0	0	52.6	47.4
Non-employee	0	15.4	38.5	15.4	30.8
Note: p-value Less than0.05					

Table 4. Relation between gender and phonetic:

Gender	Severely dissatisfied(%)	Dissatisfied (%)	Neutral (%)	Satisfied (%)	Severely satisfied (%)
Male(60)	0	0	25	33.3	41.7
Female(100)	0	0	0	25	75
Note: p-value less than0.05					

Table 5. Relation between age and phonetic

Ages	Severely dissatisfied(%)	Dissatisfied (%)	Neutral (%)	Satisfied (%)	Severely satisfied (%)
Less than 40(66)	0	0	0	18.2	81.8
More than 40(94)	0	0	14.3	33.3	52.4
Note: P-value more than 0.05					

Table 6. Relation between employment and phonetic

Employment	Severely dissatisfied(%)	Dissatisfied (%)	Neutral (%)	Satisfied(%)	Severely satisfied(%)
Employee (71)	0	0	5.3	36.8	57.9
Non-employee(89)	0	0	15.4	15.4	69.2
Note: p-value more than0.05					

Discussion

The patients should be mentally and physically get ready to accept a treatment with RPDs (RPD)because the rehabilitation of patients with denture was considered a continuous procedure and requires awareness to the specific requirements of the patients.[23,24]

In this study the largest percentage of the female in Iraq were very satisfy with the respect of phonetic and esthetic oftheir denture compared with the male patients and the differences between the gender was significant ($p<0.05$), and this may be due to the number of female in this study was larger than male, and this was agree with Baran *et al*.[25]and Zlatari*et al*[26] who reported that the satisfaction of patientwith RPDs among females was more than males.On the other hand, Singh *et al*.[27]evaluatedRPDs wearers in India and established that male were more satisfied than females with regard to chewing, esthetics, and phonetic, also Kruskal-Wallis test exposed that the difference between sex was not significant ($p>0.05$), also Zlatari*et al*.[28] established that generally, the difference between gender was not significant ($p>0.05$) with regard to the patient satisfaction level with their RPD, aesthetics, phonetic, etc.

Among age groups, the largest percentage was for the first group (younger than 40 years) was very satisfy, and the differences between the age groups was non-significant ($p>0.05$) and this may be due to a common supposition that old age patients need longer time to adapt to RPD and so the satisfaction of patient will be affected,and this was agree with de Siqueira *et al*[29]and Zlatari*et al*.[30]who established that the differences between the age groups was non-significant ($p>0.05$), while Frank *et al*. [12]established that young patients are less satisfied with their RPD, and Singh *et al*. establishedthat there was a positive relationship between the satisfaction of patient from their RPDs and theage [27], in addition, the study of Wakabayashi *et al*.[31]exposed that the satisfaction of patient with RPDs was influenced by the age, because younger patients were more dissatisfied with the denture aesthetics.

The relation between employment and esthetic,the largest percentage recorded in the employed patient were satisfied and very satisfied compared with the non-employed patients, the explanation may be due to the fact that most of employee patient was educated and so can judge and give their opinion about esthetic of the CD,and there is no study correlate the satisfaction rate with employment to compare with it.

The relation between the phonetic and age, the largest percentage of the younger patient was very satisfywith phonetic compared with the olderpatient and thismay be related to the fact that older patients need longer to adapt to dentures.This result was agree with Knezovic-Zlataric[32] whofound that the patients below 60 years are more satisfied with their RPDgenerally, and disagree with Akeel[33]who notedthat there was no significant relation between the satisfaction of patient with RPDs and age, Weinstei*et al*[34]who believe that the age was not a significant predictor of the RPD success, and also Al-Jammali ZM *et al*[35] who found that there was no significant relation of age with satisfaction of patient.

The relation between employment and phonetic, the largest percentage of non-employed patient were very satisfied compared with the employed patient, and the explanation to that was that most of employee patient was educatedas we say and the educated patient gave high grade to the phonetic specially people who work in the teaching profession, and this result was disagree with a Turkish study[36] and twoBrazilian study[37,38] studies which did not discover anydifferences between educational level groupsconcerningthe satisfaction of patient with RPDs .

Conclusion

In summary, this paper argued that from the point of phonetic and esthetic of the denture, largest percentage of the female were very satisfy compared with the male. About the age,non-significant differences between the age groups in respect of esthetic, while about the phonetic, the largest percentage of the younger patient was very satisfy compared with the older patient. The employed patient havelargest percentage of satisfactionto the esthetic of the denture, while the non-employed patient have largest percentage of satisfaction to the phonetic of the denture.

The Accumulative Effect of Heavy Metals on Liver and Kidney Functions

Zeyad Gattea Koshan Al-Rikabi[1], Montaha Abulkareem Al-Saffar[3], Adnan H. Abbas[3]

[1]Lecturer, [2]Prof., Ministry of Science and Technology/Environment and Water Directorate/Baghdad, Iraq, [3]Lecture, Department of community health,Medical technical Institute, Middle Technical University, Baghdad, Iraq

Abstract

Some of the heavy metals exist in the outer layer of the earth, which is utilized for different economic and manufacturing objectives. As some of these minerals impact humans in several ways, which are direct and indirect, others like Cadmium and Zinc are needed for several body activities, such as organ functions and biological chemical processes. Within these tests, we employed analysis of liver enzyme, urea, and creatinine, to discover the damaged tissue causing after exposure to heavy metals. Results of liver function enzymes, Aspartate aminotransferase (AST), Alanine transaminase (ALT), and Alkaline phosphatase (ALP), were registered a significantly increasing ($P \leq 0.05$) for control, Cadmium treatment and zinc treatment groups, with (32.1, 39.3, and 30.5) IU/ml, (9.6, 16.0, and 8.4) IU/ml, and (1.6, 2.5 and 2.12) IU/ml, respectively. Cadmium administration was significantly reduced ($P \leq 0.05$) in serum creatinine concentration (1.26) IU/ml, compared to the control group (2.02) IU/ml. While the average serum creatinine concentration increased to (4.99) IU/ml after giving rat group Zinc solution. Moreover, the urea concentration was significantly decreased to (18.85) IU/ml in the Cadmium treatment group than values of control and Zinc group (30.61, and 35.97) IU/ml, respectively.

Keywords: *Liver enzymes, creatinine, urea, heavy metals.*

Introduction

The effect of heavy metals on biochemical enzymes in living systems has been studied. The changes refer to the action of enzymes and/or embryonic tissues to determine the developmental processes, which are distinguished by the growth and formation of new tissues in viviparous animals, as embryonic nutrition.

Heavy metals stimulate enzyme activity via the transformation process of maternal or embryonic tissues and display in the form of natural growth variations. The metabolic levels of the embryo foreseeable to be various from the maternal, which is reflected in the enzymatic activity. Dosing of Cadmium chloride with concentration from (50 to 200) ppm to the male of Sprague Dawley rats increased aspartate aminotransferase (AST or AAT) and alanine aminotransferase (ALT or ALAT) enzymes in the kidney, liver, and brain tissues [26]. Exposure *katelysia opima* to the Mercuric chloride (0.07 and 0.14) mg/l has raised the activity of AST and reducing the activity of Na+-K+ ATPase[17].

Rainbow trout *Oncorhynchus mykiss* were significantly influenced by a sub-lethal concentration of Cadmium (Cd) and responses on growth and biochemical parameters, while chronic exposure was developing early elevation or depression, this pattern is showing adaptation to the toxicant over time. So, exposing of *Oreochromis mossambicus* to the concentration of Cadmium chloride, caused necrosis, rising the activity of AST and ALT in tissues, and increasing cell membrane permeability, resulting in damage of tissues after 1 and 2 weeks.

Heavy metals cause damage and malfunction in tissues of organisms [33]. Persistent exposure to Cd concentrations raised the enzyme›s activity of AST and ALT in *Oreochromis niloticus*, which are accomplish an important role in the metabolisms of amino acid and protein and maybe releasing into plasma, then destruction and dysfunction tissue. It has become clear that a decrease in the activity of ALP enzymes is an outcome of disruption in the membrane of the transport system, while the increase in the activity probably associated with damaged tissue, which is affected by various factors, such as water quality, lifetime history, Cd concentration and exposure period [10].

One of the major health in the recent world was prolonged exposure to environmental pollution with heavy metals, which diffusion by industrial operation, volcanic explosion, bacterial activity, spring waters, anthropogenic activities including fossil fuel combustion, erosion, agricultural activities like feeding, and bioaccumulation. Environmental health hazards of these metals are easily distinguishable from the top 10 in the list of Dangerous Materials of the Agency for Toxic Substances and Disease Registry [8] [2]. Heavy metals have a cumulative toxic affection causes chronic degradation, particularly in the neural system, renal, and liver, besides some cases affect teratogen and carcinogenic [12] [13].

The high toxicity of Cd is due to its long biological half-life (10-30) years in person tissues, which makes him attack numerous organs and systems, mainly the liver, kidney, and neural system, also. Acute and chronic Cd exposure causes hepatocyte swelling and massive necrosis as a result of elevation in enzymatic biomarkers [4] [23]. Human tissue is exposed to Cd by smoking cigarettes, agricultural uses, electroplating Cd-Nickel batteries as industrial sources, and paint pigment manufacturing units [39].

Although numerous researches on Cd toxicity performed, the molecular technique dependent on Cd toxicity has not been defining so far. The presence of Reactive Oxygen Species (ROS) resulting from the destruction of macromolecules indicates to pathogenicity caused by Cd-toxicity [22]. Anyway, it is not recognized if Cd was producing ROS directly by interacting with molecular oxygen or after represses the antioxidant protection system.

Cellular regulatory proteins are the target of free radicals generated from carcinogenic heavy metals, although they are involved in apoptosis, DNA repair, cell cycle regulation, cell growth, DNA methylation, and differentiation [15].

Cd was utilized in the production of paint, pigment alloys, coating, electrode components in producing alkaline batteries, and plastic. Cd is discharged from smelters and released into sewage sludge, fertilizers, and groundwater than is used up by plants, and reached to humans by ingestion contaminated food like cereals, vegetable, grains, and fruits [7] [34] [16].

This research aimed to study the influences of chronic oxidative tension in the liver, kidney, and liver function parameters in mice, as an outcome of exposure to environmental doses of heavy metals.

Materials and Method

This research was achieved at the Ministry of Science and Technology laboratories, three groups of mice (male and female), (C57BL), (50) mice for each group were subjected them to the same conditions of experience, such as accommodation, nutrition, and attention. The experiments were started at the beginning of April and ended after 90 days later. The first group of mice was given drinking water with a concentration of Cd salts (0.685) mg/l.

Whereas, the second group was given concentration of Zinc salts (0.572) mg/l with drinking water, while the third group was considered as a control group, which was given only distilled water throughout this period. Finally, blood was collected after drawn directly from the heart to obtain the blood serum, and then biochemical examinations of liver and kidney functions were performed. The diagnostic examination kit was of AFCO type.

Results

The difference in liver function enzyme concentrations is an indirect indication in diagnosing liver damage, as high concentrations of these enzymes in the blood cause an imbalance in liver cells. Table (1) shows that the level of AST in the Cd treatment group significantly increasing ($P \leq 0.05$) was (39.3) IU/ml compared to a control group (32.1) IU/ml. Whereas, the average significantly decreased to (30.5) IU/ml in the Zinc treatment group compared to a Cd treatment group and control group. While, ALT was significantly

increasing to (16) IU/ml in the Cd treatment group compared to the control group and Zinc treatment group with (9.6, and 8.4) IU/ml, respectively. At low concentrations of liver function enzymes, we note the presence of mathematical differences compared to the control group and significant differences when using the Cd treatment group. However, ALP concentration significantly increased (P≤0.05) in the Cd treatment group reaching to (2.57) IU/ml compared to the control, and Zinc treatment groups with (1.61, and 2.12) IU/ml, respectively.

Table (1): Effect of cadmium and zinc administration on liver enzymes

ALP	ALT	AST	Treatment
Control group	32.10±5.60^{b}	9.60±1.50^{b}	1.61±0.18^{b}
Cadmium group	39.30±9.26^{a}	16.00±3.65^{a}	2.57±0.29^{a}
Zinc group	30.50±5.64^{b}	8.40±2.31^{b}	2.12±0.29^{ab}
LSD	7.2	6.2	0.96

Besides, table (2) showed that the concentration of serum creatinine was significantly decreased (P≤0.05) in the Cd treatment group with (1.26) IU/ml compared to the control group (2.02) IU/ml. While the average serum creatinine concentration significantly increased to (4.99) IU/ml when gave Zinc treatment group. Moreover, the concentration of urea was significantly decreasing to (18.85) IU/ml in the Cd treatment group compared to control, and Zinc treatment groups with (30.61, and 35.97) IU/ml, respectively.

Table (2): Effect of cadmium and zinc administration on kidney functions

Urea	Creatinine	Treatment
Control group	2.02±0.41^{c}	30.61±9.40^{a}
Cadmium group	1.26±0.65^{b}	18.85±8.18^{b}
Zinc group	4.99±0.79^{a}	35.97±6.93^{a}
LSD	0.76	11.76

Statistical Analysis: Statistical analysis achieving by extracting the mean ± standard error and significant differences were tested between the mathematical rate using the Duncan test [6]. Analysis by using a T-test accomplish to study differences between rates of various samples [30].

Discussion

In this research, determined the toxic influences of Cd and Zinc on liver and kidney tissues. Oxidative stress was the harmful effect of heavy metals on human health. Cd metal can generate several ROS, increase lipid peroxidation, and decrease the antioxidant supply. Increasing oxidative stress markers may refer to elevate the generation of ROS, which causes damage to large molecules through an occurrence of diseases related to aging, like heart disease, Parkinson's disease, diabetes, and mitochondrial diseases[19] [4] [37].

Existence high concentration of heavy metals in the environment like Zinc and/or Cd causing food fracturing to molecules, and throw away free radicals which killing some friendly bacteria, as well as, damage to vitamins, enzymes, and yields chemicals like pesticides can form new chemicals called unique radiolysis products-URLs or toxins[5]. Some of these chemicals the long-term effect on our food was unknown, so we cannot be safe, while the immune system was affected and inhibited its functions by forming the oxidizers[38].

On the contrary, Zinc exhibit increases the efficacy of liver enzymes due to its antioxidant activity, which gives rise to a decrease in oxidative pressures, oxidation and damages the cell as a result of the interaction between hydroxyl root (unstable free root) and some life molecules. Researchers, Stohs and Bagchi [31] and Sies [28] indicated that hydroxyl produced from hydrogen peroxide by lipid peroxidation or oxidizing the DNA or protein gave an improvement to the texture of liver tissue.

DNA damage causes mutations and maybe cancer if the repair mechanisms for DNA do not work, whereas protein damage causes inhibition of enzymes and teratogen proteins [29] [35] [21]. A system of antioxidant

metabolites and enzymes prevents damage of nucleic acids, proteins, and lipids, from occurring or removed before they cause damage, and the amount of protection depends on the concentration of antioxidant and reaction conditions [28] [36].

Oxidative stress is an essential causative of several chronic diseases, such as cardiac disorders, immunologic disorder, cancer, atherosclerosis, and neurodegeneration[25]. In eukaryotic cells, the sources of ROS such as O_2, H_2O_2, and OH, were a mitochondrial respiratory chain, microsomal cytochrome P450 enzymes, flavoprotein oxidases, and peroxisomal fatty acid metabolism [3]. Zinc is an inhibitor of nicotinamide adenine dinucleotide phosphate (NADPH) oxidase, decreased production a cofactor of superoxide dismutase (SOD) (enzyme catalyzes the transfer of H_2O_2 to O_2), like ROS, and stimulate the generation of metallothionein, which is very rich in cysteine (an excellent scavenger of OH). Supplementation of Zinc to healthy human (20-50) years decreasing the concentration of malondialdehyde (MDA), 4hydroxy alkenes (HAE), and 8-hydroxy deoxyguanine in the plasma[24].

The period of exposure was the main cause of Cd accumulation in all tissues, for example, the concentration of Cd in mice was much higher in the blood, liver, and kidneys exposing for only one-day per/week for 5 weeks than exposed through 5 weeks [18]. Several tests in mice were done and discovered that the concentration of Cd in blood plasma was more than red cells after injection, and the first symptom of Cd toxicity remarked in the epithelium of blood vessels, and damage of hepatocytes due to oxygen deficiency [9] [11] [14].

The accumulation of Cd in kidneys has several reasons, transmitted from other tissues, and release from hemoglobin during hemolysis, or liberating metallothionein from red cells [9]. The molecular analysis of Cd toxicity in kidneys is still unknown, and propose that Cd encourage the lipid peroxidation and inhibits enzymes implicated in removing of activated oxygen species from various tissues [27].

Large numbers of macromolecules and more than 300 enzymatic reactions in which Zinc performs as a necessary element responsible for its structure and functions [32]. Whereas, Cd is a toxicity element causes structural distortions to proteins due to its association with sulfhydryl groups [35].

Liver destruction is determined by estimating the concentration of liver transaminase enzymes. After liver parenchymal cells damage or membrane permeability, enzymes like glutamate pyruvate transaminase (GPT), glutamate oxaloacetate transaminase (GOT), lactate dehydrogenase, arginase, and gamma-glutamyl transaminase, discharged out of the cell, and the result is an increase in the level of enzymes in the blood than normal [1] [20].

Conclusion

The research determined a new path to the study of biological impacts associated with environmental susceptibility to heavy metals. The aim is to distinguish antioxidant defense disorders and the oxidative processes in organs, like the kidney and liver, as a result of continuous exposure to lower doses of Cd and Zinc, and establish the effects of these metals on oxidation processes in the liver and kidney function indicator.

Abstract

Background: Population is not a static entity and tends to change over time. Worldwide population increases every year by more than 81 million people Such an explosion affects public health in every country but like India face higher detrimental effects on the health infrastructure thereby making it prone severe consequences. In Indian culture Women have the highest source pedestal of respect among all far more than a man that is why she is called the Goddess of Life. We conducted this study to assess knowledge of married women in reproductive age group regarding contraceptive method.

Material and Method: A quantitative Non experimental research design was adopted and the study was conducted at an apex level tertiary care maternity hospital using non probability convenient sampling technique was adopted and 100 married women were selected as sample for the study. A self-structured questionnaire was developed and data was collected to be analyzed.

Results: The results revealed that majority 56 (56%) of married women belong to age group 26- 35 years. Most 63 (63%) of the women had average knowledge scorerest all of them 37 (37 %) had poor knowledge. On application of chi square test to determine association with selected socio demographic variables, age of the women was found to be significantly associated with level of knowledge.

Keywords: *Knowledge, women, contraceptives, Contraceptive method.*

Introduction

India's population is only second to that of China. It has only 2.4% surface area of total world and yet has 17.5 % of the world's population (Lakshmi Manjeera & Neetha, 2013). One of the major factors which contributes to increase population size is the considerable decline in the death rates and incline in birth rate has due to advancement of health care system (Khan & Jerifa, 2014).Therefore, strategies related to family planning have immense importance. WHO defined the Family planning as "A way of thinking and living that is adopted voluntarily, upon the basis of knowledge, attitudes and responsible decisions by individuals and couples, in order to promote the health and welfare of the family group and thus contribute effectively to the social development of the country" (Balgir, Singh, Kaur, Verma, & Kaur, 2013). India was the first country in the world which in 1952, formulated the National Family Planning Program. The objectives of the plan was to reduce the birth rate up to the level necessary to stabilize the population at carrying capacity of nation economy (Nanda, Adak, & Bharati, 2011).Contraceptive method are effective, safe and low-cost strategies to avoid the undesired pregnancy. Contraceptive method are available for both males and females but most of them are female reproductive system oriented, therefore it is necessary for women to have proper knowledge started the various reproductive and child health program at local as well as national level (Girdhar, Chaudhary, Gill, Soni, & Sachar, 2010) but in spite of all efforts awareness and acceptance level of contraception is still low in many parts of the country. Purpose of the study was to

assess the knowledge of married women in reproductive age group regarding contraceptive method in selected hospital of district Patiala, Punjab and To determine the association between level of knowledge of married women and selected socio demographic variables with a view to develop pamphlet on information about

Literature Review: We searched for articles on contraceptive method and association of the knowledge of contraceptive method and demographic variables. A cross sectional study was conducted by Tejaswini et al in 2018 among married women about the knowledge, attitude and practices of contraception in Bowring and Lady Curzon Hospital, Bangalore. 72% of the participants had awareness of contraception. Most common method known is female sterilization followed by IUCD. Awareness of emergency contraception was found only in 5.33%. 48% of the participants did not follow any method of contraception (D, JC, & Bai,2018). Kruthika and Metgud 2017: Conducted a community based cross sectional study among married women about the prevalence of contraceptive use residing in the urban areas of Belagavi. Study revealed that prevalence of contraceptive use was 58.8%, among these 16.0% were condom user,18.9% were using IUCD, 4.3% using rhythm method, 3.3% using OCPs and 16.3% were practicing sterilization method (Kruthika & Metgud,2017). Benjamin et al 2017**:** Conducted a cross sectional study to assess the knowledge about the contraceptive measures among rural women of childbearing age in Rivers State, Nigeria. Almost all of the rural women had awareness of contraceptives but only 63% had good knowledge of it. The most commonly known method were the male condom and injectable(Osaro, Tobin-West, & Mezie-Okoye,2017). Sukla et al 2017: Conducted a cross sectional study on contraceptive knowledge, attitudes and practices among women in the reproductive age group attending a tertiary care hospital in Mumbai, the result revealed that 62.5% women were using contraception. Only 17% women used oral contraceptive pills as a contraceptive method though 66% women knew about them. Though 59.4% of the women knew about IUCDs only 3.5% were actually using IUCD(Shukla, Fonseca, & Deshmukh, 2017). Katama and Hibstu 2016:conducted a cross sectional study-about the knowledge, attitude, practice of contraceptive use among 288 female students in secondary and preparatory school, south Ethiopia. Result revealed that Total of 263 female students were involved in this study, of which 249(94.7%) had good knowledge about contraception. The three most frequently identified method were injectable form (83.9%), oral contraceptive pills (72.7%) and condom (48.6%). A total of 15.7% respondents ever used contraceptive. Among the users, 56.4% used oral contraceptive pills, and 23.1 and 10.2% used injectable form and condom, respectively (Katama & Hibstu, 2016).Alege et al. 2016:Conducted a secondary analysis of data from a larger cross- sectional study to measure changes in perceptions towards long-term and reversible contraceptive among 2,033 women of reproductive age (15-49years) resident in 34 districts of Uganda. Result. Revealed that sixtytwo per cent of women reported current use of any family planning method. Among non-users of family planning, injectables (50.4%), implants (22.8%) and pills (20.2%) were the most preferred family planning method (Alege, Matovu, Ssensalire, & Nabiwemba,2016).

Sample: A non-probability convenient sampling Technique was adopted and 100 married women were selected as sample for the study at an apex level tertiary care maternity hospital. Inclusion Criteria of the study was Married women between the age group of 15-49 years and who are willing to participate in the study and available at the time of data collection and exclusion Criteria was Women who had attained menopause was excluded. After getting the ethical approval, the final study was conducted in the selected hospital. 100 women were selected by convenient sampling technique and the data was collected by using structured knowledge questionnaire. Written informed consent was obtained before collecting data from the subjects.

Materials and Method

The study was adopted for the quantitative research approach and design was Non experimental research design. The study was conducted in selected hospital and 100 married women between the age group of 15-49 years were selected by using convenient sampling technique. The tool used for the data collection consisted of selected variables and structured knowledge questionnaire regarding knowledge on contraception. Ethical Consideration was taken by the approval of research and ethical committee was taken before starting the study. Anonymity of subject and confidentially of information was maintained. It was ensured that the study would not have any bad affect to the participant in any way and Selected variables consists of items regarding the selected variables which include, age, religion, educational status, occupation, monthly income, family

status, locality, age at marriage, duration of marriage in year, no of children, source of information and also a structured knowledge questionnaire was used to assess the knowledge regarding questionnaire. The collected data was analyzed in accordance with the objective of the study by using descriptive statistics mean, median, standard deviation, frequency, percentage and inferential statistic was used Chi square.

Results

The present study revealed that married women had average knowledge score which was 63 (63%) whereas 37(37%) had poor but none of them had good knowledge regarding contraceptive method among married women in reproductive age group in selected hospital. According to first section majority of the married women of reproductive age group 56 (56%) belong to Age group 26- 35 years, 48(48%) belong to Sikh religion, 31(31%) each were Educated up to Elementary & Secondary respectively, 73 (73%) were Housewife as per Occupation, 38 (38%)had Family income between 5,001-10,000, 47 (47%) belong to Nuclear family status, 68 (68%) were from Rural locality, 51 (51%) was 1-5 years as per duration of Married life, 32 (32%) each were one and two respectively as per number of Children and 32 (32%) used Health Personal as Source of Information. According to second section depicts that the knowledge of married women in reproductive age group regarding the contraceptive method, where majority of married women of reproductive age knowledge score 63 (63%) was average and 37 (37%) was poor but none of them had good knowledge score and according to the third section the study was association between knowledge of married women in reproductive age group regarding the contraceptive method and the selected socio demographic variable showed that in married women of reproductive age, Age of married women knowledge in reproductive age group regarding the contraceptive method in selected Hospital has association the calculated value of chi-square is (3.879) which is more than the tabled value (3.841) at 0.05% level of significance, with (1df). Hence, we can conclude that age of married women and knowledge of married women in reproductive age group regarding the contraceptive method in selected Hospital were significantly associated with eachother.

Table No. 1: Frequency and percentage of the knowledge of married women of reproductive age group regarding the contraceptive method in selected Hospital of District Patiala, Punjab. N=100

Criteria Measure of Knowledge Score		
Level of Scores	**Frequency**	**Percentage**
Good Knowledge (21-30)	0	0
Average Knowledge (11-20)	63	63
Poor Knowledge (0-10)	37	37

Maximum Score=30 Minimum Score=0

Table No. 2: Descriptive statistics of the knowledge of married women in reproductive age group regarding the contraceptive method in selected Hospital of District Patiala, Punjab. N=100

Descriptive Statistics	Mean	Median	SD	Maximum	Minimum	Range	Mean %
Knowledge Score	11.40	11	3.54	20	4	16	38

Maximum Score=30, Minimum Score=0

Discussion

According to the objectives of the study researchers presented their findings through analysis along with the comparison with other similar research findings. In the First Sectionthe analysis of socio demographic profile was calculated on the basis of percentage and frequency of married women in reproductive age group 15-49 years. In the second sectionanalysis of the knowledge of married women in reproductive age group regarding the contraceptive method in selected Hospital and in the third section to find out the association between

knowledge of married women in reproductive age group regarding the contraceptive method and the selected socio demographic variable showed that in married women of reproductive age, Age of married women knowledge in reproductive age group regarding the contraceptive method in selected Hospital.Clinical Implication of the study was to finding of the study has various implication which were discussed in areas on Nursing education,Nursing services, Nursing research and Nursing practice. In Nursing Education there is a lack of knowledge regarding temporary contraceptive measure among married women of reproductive age in India it is important that married women should increase their knowledge regarding temporary contraceptive measure so this topic should be included incurriculum. In the Nursing educator should strongly emphasize om this topic and create awareness among married women of reproductive age group who in turn can provide to other married women regarding the temporary contact measures. In the Nursing profession should render services according to the changing needs of the society. There is high need for health personnel to take part in providing health education to people regarding contraceptive measure. So There is need to prepare the community volunteers who will act as link between the community married women of reproductive age group and hospital and in the last In Nursing Research In our country lack of knowledge regarding contraceptive method is major problem so, it is essential to identify the present level of knowledge and practice of women regarding contraceptive method to know the extent of information necessary to taught and there is need for extended nursing research on contraceptive method since present study supported by many other studies reveal poor knowledge, practice and attitude of women toward contraceptive method, practices as well as attitude can be improved/enhanced . through many multiple researches are conducted by various nursing personnel at various level, yet there is serious lack in dissemination of the finding.

Ethical Approval: Approval of research and ethical committee of Department of Nursing, Chitkara School of Health Sciences was taken before starting the study. Permission was obtained from the Principal of the college and Senior Medical Officer of Hospital District Patiala, Punjab. Anonymity of subject and confidentially of information was maintained. It was ensured that the study would not have any bad affect to the participant in any way.

An Analytical Prospective Study of Plasma Pseudo–Cholinesterase Level & its Co-Relation to Mortality in Acute Organo Phosphate Poisoning

Tejas J.[1], Siva Kumar V.[1], Shruthi K.[2], Vishwanathan K.G.[3]

[1]Associate Professor, Dept. of Forensic Medicine & Toxicology, Kmchihsr, Coimbatore, Tn, [2]Assistant Professor, Dept. of Physiology, Rvsims, Chittoor, Ap, [3]Professor and Head, Dept. of Forensic Medicine, Basaveshwara Medical College & Hospital, Ka

Abstract

Background: The Incidence of Poisoning Is Constantly On The Rise In The Modern World With A Gradual Shift Towards The Use of Agricultural Poisons In Suicides With Majority of Cases Using Organophosphate Compounds And In India The Incidence of Ingested Suicidal Poisoning Is High Especially In The Southern States. This Study Is Undertaken With A View To Asses If There Is Any Correlation Between Plasma Levels of Pseudocholinesterase and mortality in cases of acute organophosphate poisoning. Method: The study was conducted on patients of organophosphate poisoning admitted to Bapuji Hospital (J.J.M. Medical College), Davangere during a period of October 2011 to March 2013. Total number of cases studied were 150. Detailed history was obtained regarding the amount of poison, type of poison, quantity of poison, etc from the patient and his/her relatives as well from the police.

Clinical examination of each patient was carried out and according to signs and symptoms, the patients were grouped into 3 grades, mild, moderate and severe according to Dreisbach's criteria. At the time of admission pseudocholinesterase was measured. All patients were followed-up for 3 days to know the outcome and results were compared and analysed.

Conclusion: Our study concludes that there is a very good correlation between the levels of plasma pseudocholinesterase and mortality as well as morbidity

Keywords: *Pseudocholinesterase, organo-phosphate, butyrylcholinesterase, agricultural poisons.*

Introduction

Paracelsus in 16th century expressed the classic toxicology maxim "All things are poison, and nothing is without poison; the dosage alone makes it so a thing is not a poison.". The world health organization defines poisoning as that which occurs when people drink, eat, breathe, inject, or touch enough of a hazardous substance (poison) to cause illness or death[1]. The incidence of poisoning is constantly on the rise in the modern world with a gradual shift towards the use of agricultural poisons in suicides with majority of cases using organophosphate compounds. In India the incidence of ingested suicidal poisoning is high especially in the southern states. This study is undertaken with a view to asses if there is any correlation between plasma levels of pseudocholinesterase and mortality in cases of acute organophosphate poisoning with an aim to develop good prognostic index and mortality predictor in such cases.

Methodology

Study Sample: The study was conducted on patients of organophosphate poisoning admitted to Bapuji Hospital (J. J. M. Medical College), Davangere

during a period of October 2011 to March 2013. Total number of cases studied were 150

Materials Used: 18-gauge needle, 10cc syringe, Colour coded vacutainer tubes, Cobas Integra 400 cholinesterase assay system.

Inclusion Criteria: All patients with Organophosphate poisoning with age more than 14 years belonging to either sex was included in the study.

Exclusion Criteria: All patients with age less than 14 years, poisoning other than organophosphate

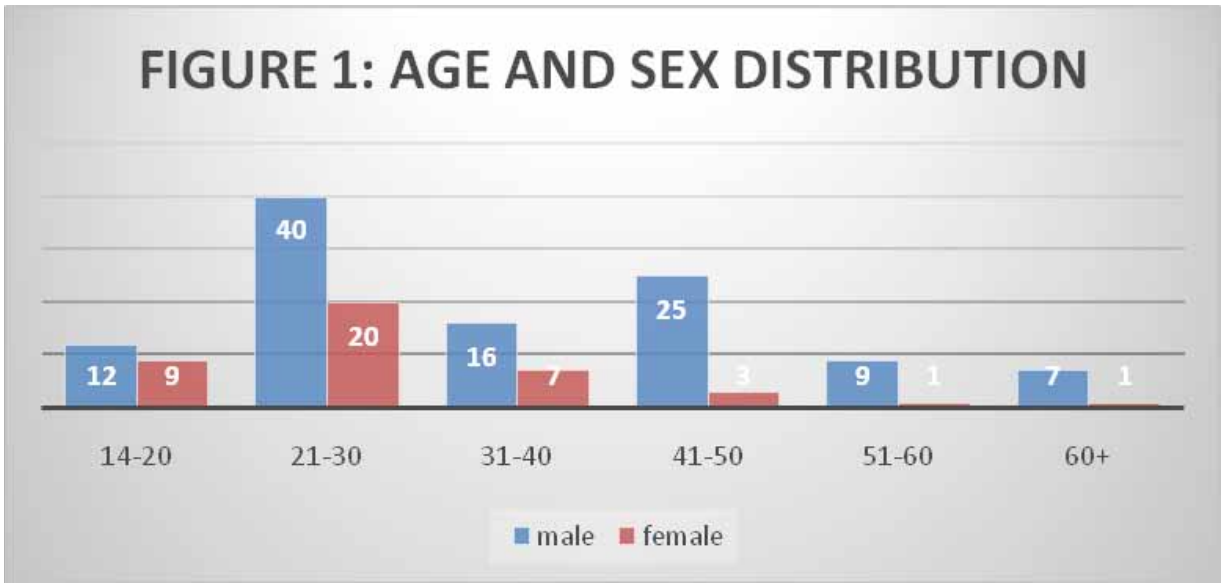
Data Collection: Data was collected from hospital admission records, hospital MLC registers, patient case history & examination and history from eye witness, relatives, friends of deceased & investigating officer. Detailed history was obtained regarding the amount of poison, type of poison, quantity of poison, etc from the patient and his/her relatives as well from the police. Examination of the poison container was also done whenever available. Clinical examination of each patient was carried out and according to signs and symptoms, the patients were grouped into 3 grades, mild, moderate and severe according to Dreisbach's criteria[2].

Grade (Dreisbachs)	Symptom
Mild	1. Nausea 2. Vomiting 3. Diarrhoea 4. Sweating
Moderate	1. Lacrimation 2. Salivation 3. Miosis 4. Fasciculation
Severe	1. Coma 2. Seizures 3. Incontinence 4. ARDS 5. Areflexia

At the time of admission pseudocholinesterase was measured by drawing blood from the patient, collected and forwarded in vacutainer tube with EDTA as preservative and subjected it to analysis by COBAS INTEGRA 400 CHOLINESTERASE ASSAY SYSTEM. The range of values in 3 control patients was found to be 13,400 U/L to 15,600 U/L at room temperature (37ºC). All patients were followed-up for 3 days to know the outcome. Also, in fatal cases the Forensic Science Laboratory was also used for conformation of organophosphorus poisoning. Results were analysed using Microsoft excel 2013 and IBM SPSS statistics 22 software.

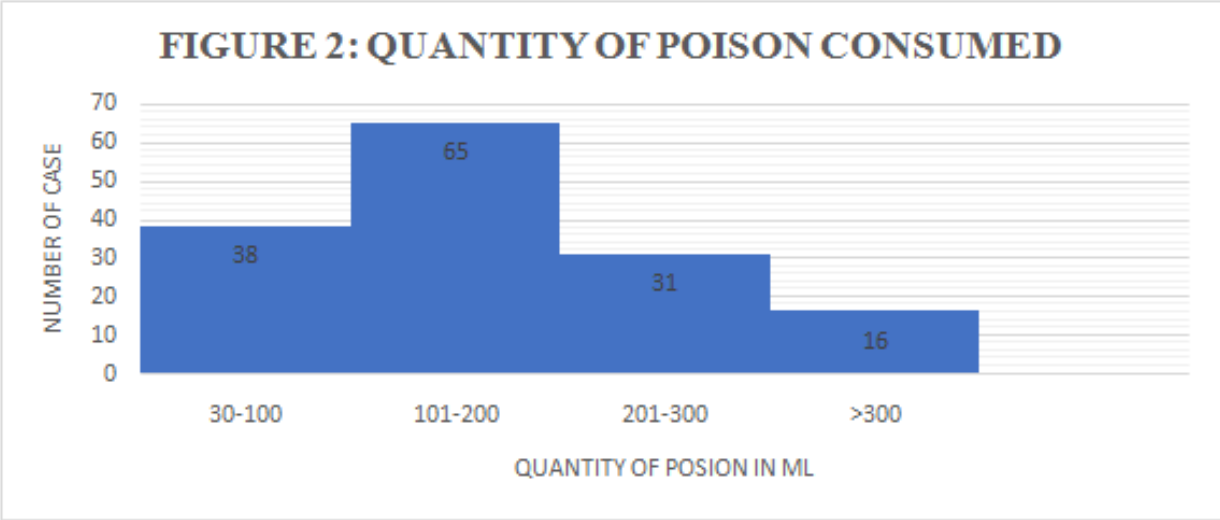
Results

Patient Characteristics: Age and Sex: The age and sex distribution of the study group is shown in figure 1. The maximum number of cases was seen in the 21 to 30 years age group. Youngest patients were 2 females of age 14 years each and oldest patient was a male of age 76 years. Sex distribution of the cases studied had a male predominance in each age group with 109 (73%) male patients to 41 (27%) female patients.

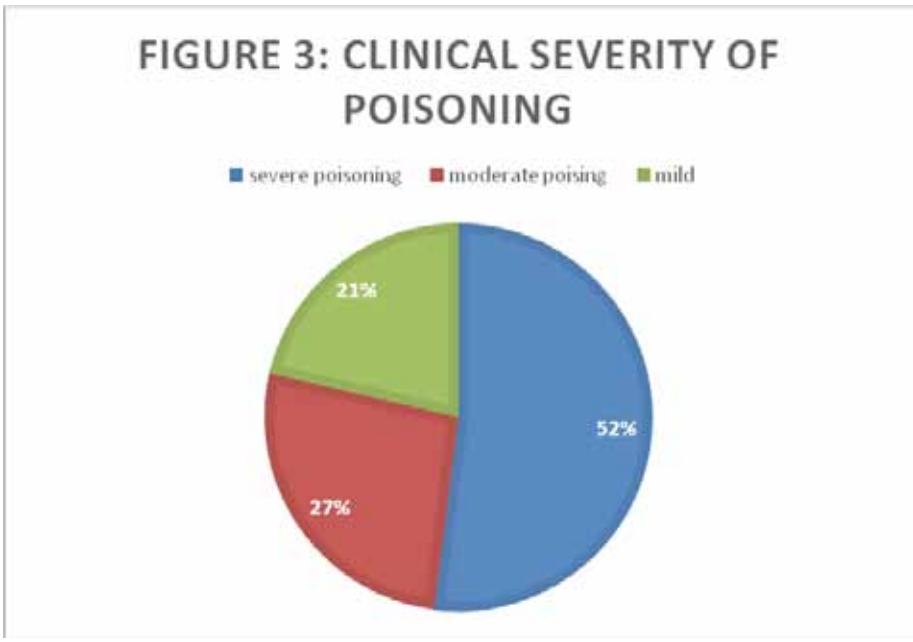


Type of Poison Consumed: The distribution of patients according to type of poison consumed is shown in figure. 2. The commonest poison consumed in the study was Malathion (28 patients, 18.67%). Second commonest was Dimethoate (26 patients, 17.33%), followed by dichlorvos and parathion. All poisons belonged to organophosphorus class.

Approximate Quantity of Insecticide Ingested: 65 patients (43.33%) had consumed 101ml to 200ml of organophosphorus compound. 38 patients (25.33%) had consumed 30ml to 100ml of organophosphorus compound. 31 patients (20.67%) had consumed 201ml to 300ml of organophosphorus compound. Very high doses of consumption i.e. > 300ml were seen in 16 patients (10.67%).



Clinical Severity of Poisoning Based on Clinical Features: The patients were clinically examined and divided into groups using the Dreisbach's criteria [2]. 78 patients (52%) had sever poisoning, 40 patients (26.67%) had moderate poisoning and 32 patients (21.33%) had mild poisoning. Emesis and gastric irritation were seen in >90% of cases followed by defecation, urination, lacrimation and salivation which were seen in >80% cases.



Final Outcome: In the 3-day follow-up 60 patients (40%) had fatal outcome (including coma) and 90 patients (60%) survived with treatment. Of the 60 fatalities, 26 cases (17.33%) died within 24 hours.

All the fatalities were associated with severe poisoning. Among those who survived 18 patients (12%) had severe poisoning.

Plasma Pseudo-Cholinesterase Levels: In the group with severe poisoning the plasma pseudo-cholinesterase levels were found to be range from 912 U/L to 2,490 U/L. (mean value = 1,696.62 U/L and S.D = +/- 438.99 U/L). This group contained all the 60 fatalities (40%) observed in this study. The Plasma Pseudocholinesterase levels of all the 60 fatal cases were compared and found to be statistically highly significant ($p < 0.001$). This amounts to suppression of plasma pseudo-cholinesterase by 84.04% to 93.19%. 18 patients (12%) survived with severe poisoning but no statistically significant difference was found between those who survived and fatalities ($p > 0.5$)

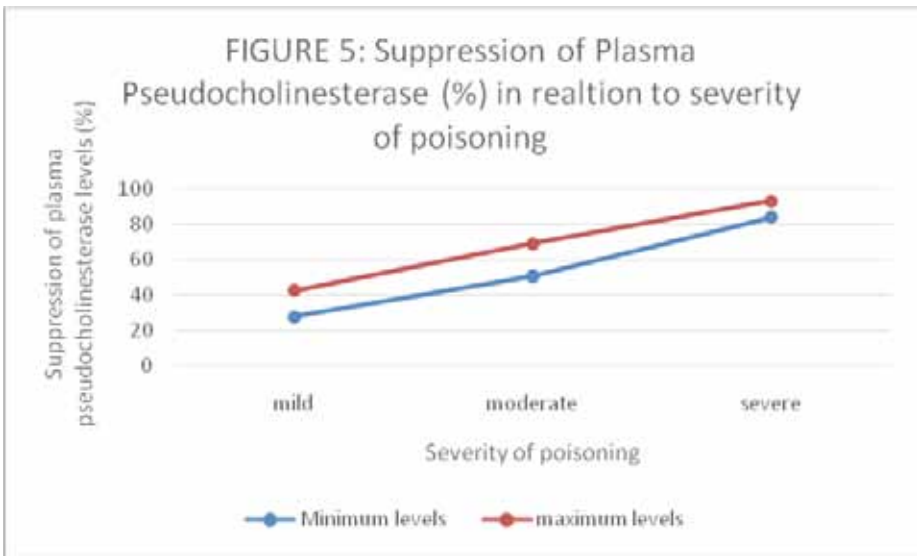
In the 26 patients (17.33%) who died within 24 hours of admission to hospital, the plasma-pseudocholinesterase levels were found to be statistically highly significant ($p < 0.001$) and ranged from 912 U/L to 1,678 U/L (mean value = 1,390.35 U/L and S.D = +/- 200.68 U/L) which amounts to suppression of plasma pseudo-cholinesterase by 89.24% to 93.19%

In the group with moderate poisoning the plasma pseudo-cholinesterase levels were compared and found to be statistically highly significant ($p < 0.001$) ranging from 4,128 U/L to 7,642 U/L (mean value = 5,339.40 U/L and S.D = +/- 1121.33 U/L). This amounts to suppression of plasma pseudo-cholinesterase by 51.01% to 69.19%

In the group with mild poisoning the plasma pseudo-cholinesterase levels were compared and found to be statistically highly significant ($p < 0.001$) ranging from 7,654 U/L to 11,230 U/L (mean value = 9,110.38 U/L and S.D = +/- 927.29). This amounts to suppression of plasma pseudo-cholinesterase by 28.01% to 42.88%

Table 1. Correlation between Severity of Posioning and Plasma Pseudocholinesterase Levels

Clinical grade of poisoning		Plasma Pseudo-Cholinesterase Levels			Percentage suppression of Plasma Pseudocholinesterase level
		Range (U/L)	Mean (U/L)	Standard deviation (U/L)	
Severe	Death within 24 hours (17.33% mortality rate)	912 to 1,678	1,380	200.68	89.24% to 93.19%
	Death over a period of 3 days following admission (40% mortality rate)	912 to 2,490	2,158.15	774.15	84.04% to 93.19%
Moderate		4,128 to 7,642	5,339.40	1121.33	51.01% to 69.19%
Mild		7,654 to 11,230	9,110.38	927.29	28.01% to 42.88%



Discussion

1. **Patient Characteristics: Age and Sex:** In the present study, the sex incidence shows males are more affected (73%) than the females (27%). Similar observations were made by Singh et al.30 [3], consisting of 67.95% males and majority of the cases were adults belonging to the age group of 21 to 30 years. Our study shows that all of the patients admitted were agricultural laborers. This could be due to easy availability and accessibility of poisons, particularly insecticides which are responsible for high incidence of poisoning among the agricultural workers. Similar incidence was reported by Sozmen et al.[4] and Naravaneni & Jamil [5] where in all the patients chosen for the study with exposure to organophosphate insecticide were farmers. In all cases the poisons were consumed via the oral route. Malathion is one of the most commonly used organophosphate insecticide and is commonly available for agricultural use. Even though it has a disagreeable taste, it is most often taken orally because of its easy availability to farmers and also lethality of its action. Other studies also reflect similar findings [3–6].

2. **Type of Poison Consumed:** The commonest poison consumed in the study was Malathion, 28 patients (18.67%). Second common was Dimethoate, 26 patients (17.33%). In all cases the poisons were consumed via the oral route. This finding is in agreement with other studies[6–9]

3. **Approximate Quantity Of Insecticide Ingested:** Majority of the patients in our study had consumed 101ml to 200ml of organophosphorus compound (43.33%). This dose is in excess of the lethal dose for the two most common poisons found to be used in our study i.e Malathion and Dimethoate.

4. **Clinical Severity of Poisoning Based on Clinical Features:** Patients with severe poisoning constituted the major group. This could be attributed partially to the manner of death as most of the cases in this study consumed poison with suicidal intent in which case the amount of poison consumed will be significantly more than accidental or very rarely homicidal consumption.

5. **Final Outcome:** The patients were followed up for 3 days during which 40% had fatal outcome (including coma) and 60% survived with treatment. of the total number of fatalities 17.33% died within 24 hours of admission to the hospital. All the fatalities were associated with sever poisoning and only 12% survived with severe poisoning. A study by Kar[10] found a mortality of 26% patients with suicidal organ phosphorus poisoning which is higher than that found in our study as our study also includes other manners of death. A study by Singh et al. [3] reports a mortality of 17.30% which is in agreement with our 24 hour mortality rate.

6. **Plasma Pseudo-Cholinesterase Levels:** In this study severe poisoning accounted for all the 60 fatalities (40%) observed and only 18 patients (12%) survived. The Plasma Pseudocholinesterase levels of all the 60 fatal cases were compared and found to be statistically highly significant ($p < 0.001$). No statistically significant difference was found between those who survived and those who died with severe poisoning ($p > 0.5$). Therefore, the pseudocholinesterase levels estimated at the time of admission to the hospital serves as a very good prognostic indictor and also helps in dose adjustment of various drugs for treatment. Severe poisoning was associated with suppression of plasma pseudocholinesterase by 84.04% to 93.19% where death occurred over a 3 day duration following admission to hospital. If plasma pseudocholinesterase was suppressed by 89.24% to 93.19% (as seen in those who died within 24 hours of admission) then it is associated with 100% mortality. This shows that there is a direct correlation between plasma pseudocholinesterase and severity of poisoning. And suppression of this enzyme by more than 89.24% (i.e. plasma pseudocholinesterase levels <1,678 U/L) is associated with fatal outcome. This is in agreement with a study by Xu, Zhang, yang and He [11] which states that when the plasma pseudocholinesterase levels reach 10% then severe acute organophosphorus poisoning occurs. A cohort study done by Eddleston and colleagues[12] found plasma pseudocholinesterase activity of <600 U/L on admission was highly sensitive in chlorpyrifos and specific for dimethoate poisoning which is also in agreement with this study. Sunder Ram et al.[13] also states that plasma pseudocholinesterase level below 10% of normal were associated with poor prognosis which is in agreement with this study. Studies reported in Reddy [14], Pillay [15] and by Sozmen and colleagues[16] are all in acceptance with this study. Kukde and colleagues[17] have found no significant difference of pseudocholinesterase levels

between post-mortem samples of brought dead cases and partially treated cases.

Limitations of the Study

1. Patients with age less than 14 years were not included in this study
2. Poisoning other than organophosphate whether taken independently or along with organophosphates (E.g. Alcohol) were not included in this study.
3. Serial monitoring of cases could not be done due to poor patient compliance and also due to economic limitations and only follow-up to know the outcome was performed.

Conclusion

Our study concludes that there is a very good correlation between the levels of plasma pseudocholinesterase and mortality as well as morbidity. This study helps not only in predicting the outcome of the patient with organophosphate poisoning based on plasma pseudocholinesterase levels but also can be retrospectively used to plan the treatment of such patients and dosage calibration of antidotes such as pralidoxime.

Perception of Nursing Care among Patients at SRM General Hospital, Kattankulathur, Kancheepuram District

Keerthana S.[1], Deepika M.[1], C. Kanniammal[2], Ushapriya Mathiazhakan[3]

[1]B.Sc. IV Year Student, SRM College of Nursing, SRMIST, [2]Dean, SRM College of Nursing, SRMIST, [3]Assistant professor, SRM College of Nursing, SRMIST

Abstract

Background: An significant point that reflects on the understanding of the standard of treatment rendered by the patient is healthcare service. Measuring the experience of nursing care patients can be helpful in improving the quality of nursing services by encouraging the setting of treatment standards and measuring both patient outcomes and quality perceptions.

Objectives: The primary aim of this study was to define the understanding of quality nursing care by the patient.

Method: To assess patients' understanding of the quality of nursing care in medical wards and surgical wards of a selected hospital, a cross-sectional descriptive research design was used. A total of 100 patients participated in the study using a purpose-based sampling methodology based on inclusion criteria, such as adult medical and surgical patients 18 years of age or older who spent at least 3 days or more in the hospital. The satisfaction of patients with the quality of nursing care (PSNCQQ) questionnaire, a standardised instrument, was used to assess the perception of the quality of nursing care by patients.

Result: The report showed 89 percent of high-quality care, 11 percent of decent quality nursing care and 0 percent of low-quality nursing care. The great benefit for members of the health care team is enhancing the standard of nursing care according to the understanding of the patient. The primary source of the health care scheme is providing high quality nursing care.

Conclusion: The results showed that nurses should inform patients about the application and protocol and provide sufficient condition, diagnosis and treatment descriptions to ensure patient satisfaction and high-quality nursing care.

Keywords: *Assess, patients, perception, and nursing care.*

Introduction

A growing trial in any sector would impact the healthcare industry today as well[1]. Healthcare delivery is a central factor that reflects on the patient's understanding of the quality of the care they receive[2]. Assessing the quality of nurses' services is vital and so nurses are forced to sustain and enhance the standard of their nursing care[3] Patients' perception of nursing has been known as the most important indicator of overall patient satisfaction and an essential target of any healthcare organization[4]. Measuring the perception of patients about nursing care may be successful in improving the quality of nursing services by promoting the development of standards for treatment by tracking both outcomes and patients' perceptions of quality[5].

Patients communicate their needs with respect to what they need, like, want, expect and demand about the nursing care they receive. The understanding of patients

Corresponding Author:
Ms. Ushapriya Mathiazhakan
Assistant Professor, SRM College of Nursing, SRM Institute of Science and Technology, SRM Nagar, Kattankulathur, Chennai, 603203, Tamil Nadu, India
e-mail: ushapriyansg@gmail.com

with the quality of nursing aid is that the required component within the hospital and it is helpful to improve the regular patient-supported reading[6]. Patients may expect more detail on their condition, choices for treatment, procedure, and nursing care. The key objective of health care providers is to achieve excellence in nursing care through the desires and perceptions of the quality of nursing care patients[7]. Hence the purpose of this study was to establish the understanding of quality nursing care by the patient.

Method and Materials

A descriptive cross-sectional research design was used to test the impression of patients about the quality of nursing care in a selected hospital's medical wards and surgical wards. Complete 100 patients recruited for the study based on inclusion criteria such as adult medical patients aged 18 years or older, who have spent at least 3 days or more in the ward, able to understand Tamil or English and agreed to participate in this study and signed informed consent, and selected patients were interviewed.Before starting the study, the SRMIST had obtained ethical approval. The researcher met each participant and explained the study intent and the instrument. -- participant who decided to complete the instrument was also given written and orally informed consent to take part in the research. Those who were unable to read nor write were aided in completing the questionnaire.

The PSNCQQ was designed to quantify the degree of anticipated need, evaluate patient satisfaction following short-stay hospitalisation, and determine at a minimum level the impact of socio-demographic, personal and other factors[8] The scale was developed using the Hospital Quality Questionnaire Patient Judgements, developed by a multidisciplinary research team at the Hospital Corporation.of America. The scale was developed for managers to apply in areas needing change, to provide patient-oriented outcomes, and to recognise positive and poor aspects of the nursing care process. Things were focused on variables that were established as essential elements of nursing patient satisfaction. The PSNCQQ can be integrated into current quality control systems in hospitals. Besides, given its relevance to the patient care process as a consequence measure, the PSNCQQ can be used as an evidence-based predictor to detect improvements in departmental and institutional processes. This input gives the nursing administrators valuable knowledge. Replies to the participants are given using a Likert-type 5-point scale. The scoring level was defined as low-quality nursing care (< 50%), acceptable or good-quality nursing care (50-75%), and high-quality nursing care (> 75%). The original English instrument was translated into Tamil and the reliability was obtained using 0.92-value Spearman-Brown formula. The data were analysed using statistics of descriptive and inferential type.

Results and Discussion

Result indicates that 24% belong to 21-30 years of age, 17% belong to 31-40 years of age, 13% belong to 41-50 years of age, 34% belong to 51-60 years of age, 12% belong to > 60 years of age. As far as sex is concerned, 40% belong to males and 60% belong to females. 78% belong to the Hindu faith, 9% belong to the Muslims, 13% belong to the Christians. 75% of monthly income belongs to 12000-17000, 11% belongs to 17000-22000, 13% belongs to 22000-37000, 1% belongs to 37000-50000000, 1% belongs to 37000-5000000. As for marital status, 70% belong to married people, 18% belong to unmarried people, 2% belong to divorced people. 58 percent of schooling belongs to primary education, 14 percent to secondary education, 5 percent to diplomas, 17 percent to undergraduates, 6 percent to postgraduates. In terms of occupation, 20 percent belong to specialists, 11 percent belong to technicians, 25 percent belong to skilled employees and business sales workers, 21 percent belong to skilled agricultural and fishery workers, 17 percent belong to elementary workers, 6 percent belong to unemployed workers.As for the area of living, 50% belongs to urban areas, 50% to rural areas. 58 percent belongs to only once, 22 percent belongs to twice, 11 percent belongs to three times, 9 percent belongs to > 3 times, with respect to the number of times hospitalised. 69 percent belong to one week with regard to none of the days hospitalised, 20 percent belong to two weeks, 7 percent belong to 3 weeks, 4 percent belong to > 3 weeks.

Table 1 : Level of Quality Nursing Care N=100

S.No.	Quality of Nursing	No. of Respondents	Percentage
1	Low	0	0%
2	Good	11	11%
3	High	89	89%

Table 1 reveals that 89% of patients receive high-quality nursing care, 11% receive good-quality nursing care, and 0% receive low-quality nursing care.

Table 2: Association between the knowledge level on Nursing Quality and demographic variable N=100

S.No.	Demographic Variable	Class	Quality of Nursing		Chi-Square value	DF	P-value
			Good	High			
1	Ages in years	21-30 Years	3	21	1.069	4	0.899

*Significant at 5% level **-Significant at 1% level

Communication skills of health professionals play a pivotal role in ensuring patients feel valued and taken care of. Allocating sufficient time to speak and listen to patients and providing information is a prerequisite for patient satisfaction, as it ensures patients are less stressed and more engaged and well-adjusted. The study's first aim of evaluating the perception of nursing care among patients at SRM General Hospital. The result revealed that 89 percent of patients receive high-quality nursing care, 11 percent of patients receive good quality nursing care and 0 percent receive low-quality care. Khan et al., 2007 conducted a study on patient satisfaction with Henderson's basic model of nursing aid regarding medical aid. The study did not hide the fact that forty-fifth patients were happy about the quality of nursing aid and fifty-five were partially unhappy about the quality of medical aid and nineth patients didn't feel like talking to a worker nurse[9].

The study's second aim to link the perception of nursing care among patients with their selected demographic variables. No significant association exists between the opinion regarding nursing quality and patient demographic variables ($p<0.055$). Lumby (2005) conducted a study with a valid form, four hundredth of the population, on patient satisfaction with medical aid. According to the current study, eighty-four patients were happy with nursing aid and fifty-four patients did not feel comfortable talking to nurses. Patients' full age, sex, and educational levels had no significant influence on patient satisfaction in this study. Lots of sample size required to validate [10].

Conclusion

The results showed that 89% of high-quality care, 11% good quality nursing care and 0% low-quality nursing care. Nurses should inform patients about each application and procedure, and provide the necessary explanations about disease, diagnosis, and treatment to ensure patient satisfaction and quality nursing care.

Acknowledgements: We would like to thank the management, principal, superintendent of nursing and staff at the hospital concerned for their cooperation and support.

Authors' Contributions: I wish to express my heartfelt gratitude to the participants who have given willingness to take part in the study.

Conflicts of Interest: No conflicts of interest exist.

Authors' Funding: Self.

Abstract

Background: One of the most common infections caused by protozoa in India is malaria. Malaria cases have different geographic distribution in different areas. So it is important that hospitals in different areas draw their own set of data regarding clinical and hematological characteristics of malaria. The present study was conducted to evaluate the spectrum of clinical and hematological changes in patients of malaria.

Material and method: We conducted retrospective study at Pathology department, Sumandeepvidyapeeth, with 55 patients aged between 5 to 75 years.

Results: Out of 55, 40 were males and 15 were females. PV constituted majority of the cases, followed by PF. We reported anemia in 34 of malaria cases. Maximum cases of anemia was seen in PF. Thrombocytopenia was seen in 42 of malaria cases. Maximum cases was seen in PV. Leucocyte count was within reference range in majority of our cases 42.

Conclusion: Fever with rigors and chills, headache and splenomegaly are the most common clinical alteration and anemia and thrombocytopenia are most common hematological alteration in cases of malaria. Presence of these classic picture in a patient ever, helps diagnosing malaria at the earlier stages. In that way, early treatment can be introduced.

Keywords: *Anemia, Fever, Malaria,Plasmodium falciparum, Thrombocytopenia.*

Introduction

One of the most common infections caused by protozoa in India is malaria. There are five different species of plasmodium (P.) that are responsible for malaria infection in humans. These are Plasmodiumfalciparum (PF), Plasmodium vivax (PV), Plasmodiumovale, Plasmodiummalariae and Plasmodiumknowlesi. A bitefron infected female Anopheles type of mosquito is the main route of transmission. Other routes are via blood transfusion, marrow transplants and across the placenta. Causative agent of severe and complicated malaria is usually PF. Other species causes usually mild disease. [1] Although there is continuous ongoing work to decrease the number of case by various means, malaria still remains the most common protozoan infection in developing countries. [2] World health organization report states that 6% of the cases all over the world are detected in India. [3]

Most common clinical features of malaria are fever which is intermittent and high grade in nature, rigors and chills, headache, nausea and vomiting.[4] There are certain characteristic hematological changes that are attributed to malaria and commonly seen among malaria patients. Some of the common findings are anemia, thrombocytopenia, leucopenia and splenomegaly. [5-7] The present study was carried out to have insight into the clinical and hematological spectrum of changes in patients of malaria in Gujarat.

Material and Method

We conducted this retrospective study at Hematologylaboratory, Pathology department, Sumandeepvidyapeeth, Vadodara. We included total 55 patients aged between 5 to 75 years with either gender. Details regarding demographic, clinical and laboratory investigations of each patients were noted. Patients below 5 years and more than 75 years were excluded from the study. Two mililitres blood was collected in EDTA vaccuttee and processed oncell counter SYSMEX KX-21. All hematological report details were noted. We prepared blood films for both thick and thin smears as per the standard protocols and were processed further with giemsa stain and leishman cytochrome stain. A positive diagnosis of malaria was confirmed by pathologist after examination of thick and thin smear. Malaria species identification was done for different species. We called the patient has an anemia when the hemoglobin (Hb) was less than 13g/dl in a male patient and less than 12 g/dl in a female patient. Thrombocytopenia was diagnosed when the platelet count was less than 1.5 lacs/cumm. Leucopenia and leucocytosis when total leucocyte count(TLC) was less than 4000 cells/cumm and more than 11000 cells/cumm respectively. We used Epi info software for calculating various statistics.

Results

We conducted this retrospective study at Hematologylaboratory, Pathology department, Sumandeepvidyapeeth, Vadodara. We included total 55 patients aged between 5 to 75 years with either gender. Details regarding demographic, clinical and laboratory investigations of each patients were noted.

There were total 55 cases of malaria, 40(72.7%) were males and 15(27.3%) were females. We found male preponderance of the disease. (Table – 1) Male to female ratio in our study was found to be 2.6:1.

Table 1. Gender wise distribution of the cases

Gender	Cases	Percentage (%)
Male	40	72.7
Female	15	27.3
Total	**55**	**100**

We divided the cases into 3 groups as per species identification. (Table – 2) Highest numbers were of PV 41(74.5%), followed by PF 12(21.8%) and mixed infection 2 (3.6%) type.

Table 2. Distribution of cases as per the malaria species identification

Malaria Species	No of Cases	Percentage
P. Falciparum	12	21.8%
P. Vivax	41	74.5%
Mixed Infection	02	3.6%
Total	**55**	**100%**

We evaluated clinical data of all the cases of malaria. Fever was seen in all the cases 55(100%). Apart from fever, the most common clinical features were rigors and chills 34(61.8%) followed by headache 26(47.2%), nausea and vomiting 20(36.3%) and splenomegaly 28(50.9%) (Figure 1).

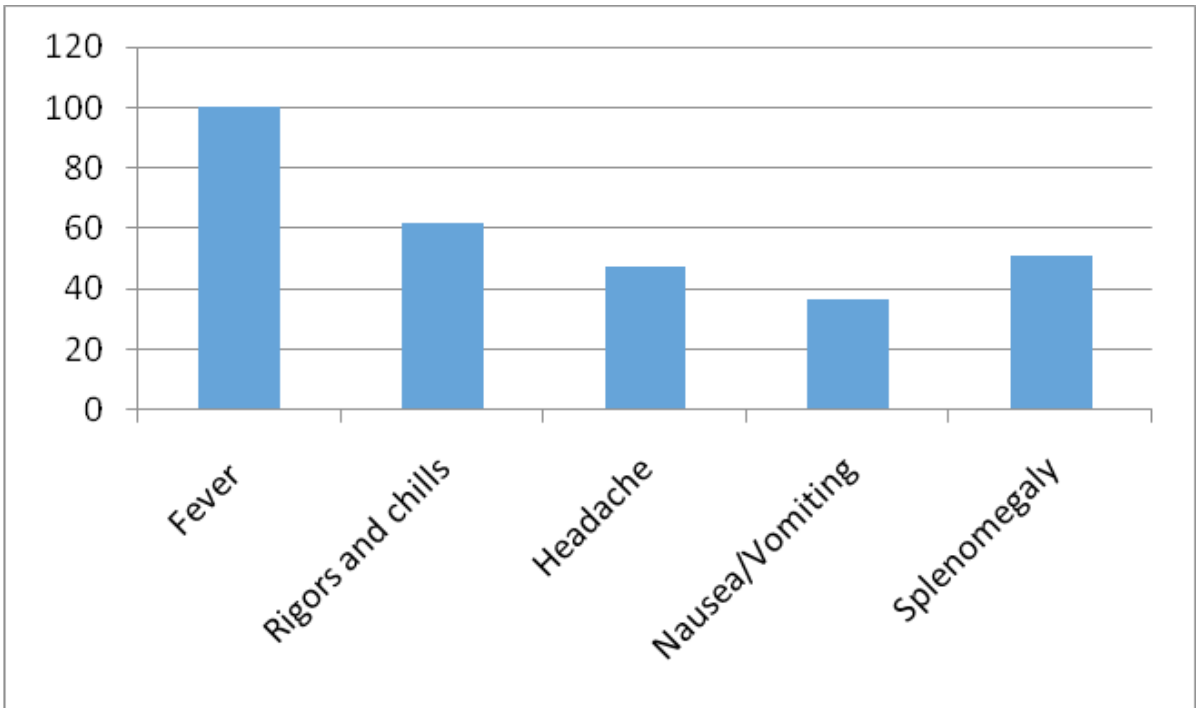

Figure 1. Distribution of cases as per the clinical features

We found anemia in 34(61.8%) of malaria cases. Other 21(38.2%) cases had normal hemoglobin levels. Out of these 34 cases maximum cases of anemia was seen in PF 11(91.6%), followed by PV 22(53.6%) and mixed infection 01(50%). (Table 3).

Table 3. Distribution of anemia cases in different types of malaria

Type of Malaria	Cases with Anemia	Cases With Normal Hemoglobin	Total
P. Falciparum	11(91.6%)	01(8.3%)	12(21.8%)
P. Vivax	22(53.6%)	19(46.3%)	41(74.5%)
Mixed Infction	01(50%)	01(50%)	2 (3.6%)
Total	**34(61.8%)**	**21(38.2%)**	**55(100%)**

We found thrombocytopenia in 42(76.4%) of malaria cases. Other 13(23.6%) cases had normal platelet counts. Out of these 42 cases maximum cases of thrombocytopenia was seen in PV 31(75.6%), followed by PF 9(75%) and mixed infection 0(0%). (Table 4).

Table 4. Distribution of thrombocytopenia cases in different types of malaria

Type of Malaria	Cases with Thrombocytopenia	Cases With Normal Platelet Count	Total
P. Falciparum	9(75%)	03(25%)	12(21.8%)
P. Vivax	31(75.6%)	10(24.3%)	41(74.5%)
Mixed Infction	0(0%)	02(100%)	2 (3.6%)
Total	**42(76.4%)**	**13(23.6%)**	**55(100%)**

In our study, maximum cases had leucocyte count within normal reference range e.g 42(76.4%). Leucocytosis was present in 8(14.5%) and leucopenia in 5(9.1%) cases. Out of these, PF showed higher number of leucocytosi (8.3%), while PV showed higher cases of leucopenia, while both the cases of mixed infection showed normal TLC. (Table 5).

Table 5. Distribution of leucocytosis and leucopenia cases in different types of malaria

Type of Malaria	Cases with Leucocytosis	Cases With Leucopenia	Cases With Normal Tlc	Total
P. Falciparum	1(8.3%)	1(8.3%)	10(83.3%)	12(21.8%)
P. Vivax	1(2.4%)	4(9.8%)	36(87.8%)	41(74.5%)
Mixed Infction	0(0%)	0(0%)	02(100%)	2 (3.6%)
Total	8(14.5%)	5(9.1%)	42(76.4%).	55(100%)

Discussion

The present retrospective study included total 55 patients with age ranging from 5 years to 75 years. There was male preponderance in our study with male to female ratio of 2.6:1. This finding was comparable with many other studies carried out previously [4, 8-9] This can be due to increased exposure to males attributed to their more outdoor work as compared to females in some areas. In this study, there was maximum number of cases of PV type of malaria. Many other studies also showed the similar findings. [8-10]

In our study, fever was seen in all cases 55(100%). Apart from fever, the most common clinical features were rigors and chills 34(61.8%) followed by headache 26(47.2%), nausea and vomiting 20(36.3%) and splenomegaly 28(50.9%). These findings were comparable to the study done by Chaudry et el. [8]

The most frequent finding in malaria is anemia. It can result from combination of many etiological factors. Eg. Lysis of infected red blood cells, bone marrow inefficiency, splenomegaly etc. Total 34(61.8%) patients out of 55(100%) patients presented with anemia in our study. Whis is comparable to the previous literatures. [4] Study done by Chaudry et el., Awoke N et al. and Abro AH et al. showed maximum cases of anemia in PF cases as compared to other types of malaria. We found the similar results in our study. [8, 11-12]

Thrombocytopenia is very common hematological change that is seen in malaria. These can be due to various reasons. Eg. immunological mechanism, splenomegaly, or bone marrow inefficiency. We found thrombocytopenia in 42(76.4%) of total malaria cases. These results are comparable to that of the studies done by Abro AH et al., Jojera et al and Haroon et al. [12-14] Our study showed maximum cases of thrombocytopenia in PV 31(75.6%) as compared to PF 9(75%) and mixed infection 0(0%). These findings were comparable to that of the study done by Chaudry et el. [8]

Majority of the cases in our study showed leucocyte count within normal reference range e.g 42(76.4%). Leucocytosis was present in 8(14.5%) and leucopenia in 5(9.1%) cases. These findings are similar to previous published literature. [4, 8-9] Leucopenia in malaria can be attributed to various theories e.g. immune mediated, low cell life, cell migration, increased inflammation, sequestration, bone marrow inefficiency etc. Study done by Abro AH et al. showed leucopenia to be more associated with PV than PF cases. We found the similar results in our study. [12]

Conclusion

High prevalence of malaria indicates importance of its timely diagnosis and treatment. Presence of classic clinical and hematological picture in a patient with fever, helps diagnosing malaria at the earlier stages. In that way, early treatment can be introduced and mortality occurring as a consequence of complicated cases on long run can be prevented.

Relationship of Knowledge and Attitudes with Male Participation in Vasectomy in Indonesia

Tjahja Bintoro[1], Bhisma Murti[2], Endang Sutisna[2], Suwarto[3]

[1]Doctoral Student, Universitas Sebelas Maret, Solo, Indonesia, [2]Professor Public Health Department, Universitas Sebelas Maret, Solo, Indonesia, [3]Professor Agriculture Department, Universitas Sebeleas Maret, Solo, Indonesia

Abstract

Family planning is an effort to control the birth of children, the ideal space and age for childbirth, pregnancy control, through promotion, protection, and assistance in accordance with reproductive rights to form a quality family. Vasectomy, or vas occlusion, is considered to be the most effective and very popular form of contraception. This study aims to analyze the relationship between knowledge and attitudes with vasectomy participation in men. This study used a cross-sectional approach. The research location is in Madiun City, East Java, Indonesia. The total sample in this study was 323 respondents. The variables in the study were knowledge, attitudes, and participation in vasectomy family planning. There is a relationship between knowledge and attitudes about vasectomy with male participation in vasectomy.

Keywords: *Attitude, family planning, knowledge, vasectomy.*

Introduction

In 2020-2030 Indonesia has the opportunity to experience a demographic bonus. The country of Indonesia will have around 180 million people of productive age, while those who are not productive will reduce to 60 million people. This means that 10 people of productive age will bear 3-4 people of non-productive age[(1)]. One of the efforts to control the population growth rate is by using a family planning program. Family planning is a government program to improve the quality of life in Indonesia. KB is an effort to control the birth of a child, the ideal space and age for childbirth, control of pregnancy, through promotion, protection, and assistance in accordance with reproductive rights to form a quality family [(2)].

The male participation rate in using contraceptives in Indonesia is still very low, namely, only 2.1% of male family planning participants, and they generally use condoms. This percentage is lower when compared to other countries, such as Iran (12%), Tunisia (16%), Malaysia (9-11%), even in the United States it reached 32%. Very few men want to use contraceptives, either condoms or vasectomy. Of the total number of family planning acceptors in Indonesia, around 97% are women. Therefore, the socialization of family planning programs among men must be increased[(3)].

Vasectomy, or vas occlusion, is considered to be the most effective form of contraception and is very popular in many developed and developing countries. For men who don't want more children, a vasectomy offers several benefits: effectiveness, quick and simple procedure, permanent protection, convenience, low risk of complications, no long-term effects on his health or sexual performance, and no health risks to his wife[(4)]. One of the important evaluations in the application of the family planning method is the knowledge, attitudes, motivation, and behavior of the community. This study aims to analyze the relationship between knowledge and attitudes with vasectomy participation in men.

Method

This study used a cross-sectional approach. The research location is in Madiun City, East Java, Indonesia. The sampling method used for the case group and the control group was fixed disease sampling, which is a sampling scheme based on the subject's disease status, that is, diseased or not having the disease under study, while the subject's exposure status varies according to the subject's disease status. The number of estimates for the case group and the control group used a ratio of 1: 3 in each case. The case group in this study were husbands who were willing to accept vasectomy as many as 85 respondents, while for the control group were taken from husbands who did not use vasectomy as many as 238 respondents. The total sample in this study was 323 respondents. The variables in the study were knowledge, attitudes, and participation in vasectomy family planning. The data was tabulated in terms of the frequency distribution of different variables. A Chi-square test of significance was employed for testing associations. P <0.005 was considered for statistical significance. The study was approved by the Institutional Ethics Committee.

Results

Table 1: Respondent characteristics

Respondent characteristics	Vasectomy (n=85)	Non-Vasectomy (n=238)
Religion		
Islam	83 (98%)	229 (96%)
Christian	2 (2%)	9 (4%)
Age (mean)	49 Tahun	42 Tahun
Age of married husband (mean)	26 Tahun	27 Tahun
Wife's age (mean)	42 Tahun	39 Tahun
Education Level		
No school	0 (0%)	2 (1%)
Primary school	7 (8%)	12 (5%)
Junior high school	25 (29%)	32 (13%)
High school	46 (55%)	166 (70%)
Higher education	7 (8%)	26 (11%)
Employment		
Civil servants	5 (6%)	16 (7%)
Private employees	32(38%)	64 (27%)
Labor	27 (32%)	50 (21%)
Farmer	3 (4%)	5 (2%)
Driver	2 (2%)	11 (5%)
Etc	16 (19%)	92 (39%)
Source of information related to family planning		
Family planning volunteer	49 (58%)	105 (44%)
Health workers	35 (41%)	126 (53%)
Family member	1 (1%)	5 (2%)
Print media	0 (0%)	2 (1%)

Table 1 describes the characteristics of the research respondents divided into 2 (two) groups, namely respondents who used vasectomy and did not use vasectomy. The mean age of vasectomy respondents was 49 years and 42 years of non-vasectomy. The mean age of the respondents at marriage was 26 years (vasectomy) and 27 years (non-vasectomy). The mean age of the respondents' wives was 42 years (vasectomy) and 39 years (non-vasectomy). Half of the vasectomy (55%) and non-vasectomy (70%) respondents had a high school education level. Nearly half of vasectomy (38%) and non-vasectomy (39%) respondents have jobs as private employees and others such as: having their own business. Most of the vasectomy (58%) and non-vasectomy (53%) respondents received information related to family planning from family planning cadres and health workers.

Table 2 Relationship of knowledge and attitude with vasectomy participation

Variable Characteristics	Vasectomy (n=85)	Non- Vasectomy (n=238)	P
Knowledge about vasectomy			
Less	53 (62%)	127 (53%)	0.01
Enough	26 (31%)	58 (24%)	
Well	6 (7%)	53 (22%)	
Attitudes towards vasectomy family planning			
Positive	0 (0%)	5 (2%)	0.00
Negative	85 (100%)	233 (98%)	

Table 2 shows 62% of men with vasectomy have insufficient knowledge of vasectomy, only 7% of men with vasectomy have good knowledge. The same thing was also found in non-vasectomy men, 53% had less knowledge about vasectomy and 22% had good knowledge. 100% of men with vasectomy and 98% of men without vasectomy have a negative attitude towards vasectomy. Knowledge about vasectomy and attitudes towards vasectomy have a relationship with male participation in vasectomy.

Discussion

The study found that respondents' level of knowledge about vasectomy is at a low level. This may be due to a large number of respondents with junior and senior high school education. The vasectomy method is usually used by men who have a good level of education [(5)]. The results of a study in Taiwan showed that men who chose vasectomy had higher education (68.5% had a bachelor's degree)[(6)].

A person with higher education means that information is easier to transfer and receive, and ultimately more knowledge is acquired. Conversely, if the level of education is low, it will hinder the development of one's attitude in receiving information and the newly introduced values. However, the number of non-vasectomy respondents was more than the respondents who actively participated using vasectomy and there were still some respondents who had good knowledge but did not participate in vasectomy. This means that the level of knowledge does not guarantee that someone will take an action or show any kind of healthy behavior.

A person with higher education means that information is easier to transfer and receive, and ultimately more knowledge is acquired. Conversely, if the level of education is low, it will hinder the development of one's attitude in receiving information and the newly introduced values. However, the number of non-vasectomy respondents was more than the respondents who actively participated using vasectomy and there were still some respondents who had good knowledge but did not participate in vasectomy. This means that the level of knowledge does not guarantee that someone will take an action or show any kind of healthy behavior[(7)].

The results of the research on the frequency distribution of attitudes towards the choice of vasectomy

show that more respondents are negative than positive. Attitude towards vasectomy is determined by the respondent's voice for the vasectomy itself. Negative attitudes arise from negative beliefs. Respondents who have negative attitudes use non-vasectomy more than a vasectomy. Attitude is a reaction or response that is still closed from a stimulus or object. The components that are built into attitudes are 1) beliefs (beliefs), ideas and concepts, towards an object; 2) emotional life or evaluation of an object; 3) propensity to act. Thus, a person's belief or belief about an object affects the action to be performed[7].

The attitude analysis related to the choice of vasectomy shows that there are respondents who have a positive attitude but do not use vasectomy, and there are respondents who have a negative attitude but participate actively in vasectomy. There are two kinds of community participation method, namely participation in a coercive way to force the community to contribute to the program (through laws and regulations, regulations, or oral orders), then second, participation through persuasion and education. Positive beliefs will form a positive attitude. Furthermore, a positive attitude develops a person's tendency to act positively as well. If someone has negative beliefs or negative concepts, it will form a negative attitude which then makes it difficult to act positively[7].

Conclusion

There is a relationship between knowledge and attitudes about vasectomy with male participation in vasectomy.

Acknowledgment: I would like to thank the respondents who participated.

Premarital Sex Behaviour of Adolescents in Makassar, Indonesia

Theresia Limbong[1], Made Sukarta[2]

[1]Associate Professor, [2]Assisstant Professor, Department of Midwifery, Health Polytechnic of Ministry of Health in Makassar, Indonesia

Abstract

Based on projections of the National Development Planning Agency (Bappenas) the number of population Indonesia in 2018 reached 265 million people. The number consists of 133,17 million men and 131,88 million women and 44,10 million are teenagers. The population data in South Sulawesi in 2018 was 8,771,970 people and in 2015 the population of South Sulawesi was 8,520 million people and 1,56 million people were teenagers. Adolescent sexual behavior, especially premarital sexual behavior, still dominates the debate in terms of moral, psychological, and physical. Premarital sex in adolescents is a serious problem because it relates to the low use of contraception and adolescents tend to have more sexual partners if they start having premarital sex at an earlier age. This article aims to find out knowledge, attitudes, actions of premarital sexual behavior and its relationship with the environment promiscuity in adolescents in Makassar, Indonesia. This research is an observational analytic study with cross-sectional study design. The time used in this study is 8 months. The location of the study will be conducted in high school students 17 & 19 in Makassar, one of the Metropolitan cities in Indonesia. The population in this study is high school students 17 & 19 in Makassar City as many as 200 students. In this study, researchers used the proportionate random sampling method, a sample consists of 134 students. The analysis used in the study was the Chi-Square test. This study results that there was a significant relationship between premarital sex knowledge with a social circle of friends with p-value = 0.029 and also a significant relationship between knowledge with a place to hang out with p-value = 0.009. There was a significant relationship between premarital sex attitudes with the social environment of friends with p-value = 0.034 and there was also a significant relationship between attitudes with the place to hang out with p-value = 0.020. There is a significant relationship between premarital sex behavior with the community's social environment with p-value = 0.003.

Keywords: *Premarital sex, Social environment, Adolescents.*

Introduction

The population number of Indonesia in 2018 reached 265 million people. The number consists of 133,17 million men and 131,88 million women and 44,10 million are teenagers. The population data in South Sulawesi in 2018 was 8,771,970 people and in 2015 the population of South Sulawesi was 8,520 million people and 1,56 million people were teenagers.[1]

Adolescence is a rapid period of growth and development both physically, psychologically, and intellectually. This is influenced by the maturation of the hormonal system in adolescents, changes in height, weight, and body development of adolescents who show signs of puberty developing rapidly. The age limit for unmarried adolescent boys or girls aged 15 to 24 years. The need for improved health and social services for adolescents is increasingly becoming a worldwide concern since the International Conference on Population and Development (ICPD) in Cairo Egypt

in 1994. The conference agreed on a paradigm shift in the management of population and development issues from an approach to population control and fertility reduction to an approach focused on reproductive health and efforts to fulfill reproductive rights.[2]

Adolescent sexual behavior, especially premarital sexual behavior, still dominates the debate in terms of moral, psychological, and physical. Premarital sex in adolescents is a serious problem because it relates to the low use of contraception and adolescents tend to have more sexual partners if they start having premarital sex at an earlier age.[3] Unsafe sex is the second most important risk factor for the emergence of disability and death in poor countries, as well as the 9th most important risk factor in developed countries.[4] Premarital sex in adolescents experienced an increase during the 20th century. The age of adolescents starting to have premarital sex varies from country to country, ranging from 12-17.5 years and on average starting at the age of 15 years.[5]

Previous studies in Indonesia on adolescent premarital sexual behavior obtained results about 25-51% of adolescents had premarital sex.[6] The results of the Indonesian Adolescent Reproductive Health Survey (SKRRI) in 2007 showed 6.4% of adolescent boys and 1.3% of adolescent girls have had premarital sex. Studies in Bali obtained the results of adolescent boys in high school and in junior high school more who had premarital sex (40.3% and 29.4%) compared to adolescent girls (3.6% and 12.5%). Male adolescents in Bali are more permissive towards premarital sexual behavior compared to adolescent girls and about 5% of adolescents have had premarital sex.[7]

Issues that are still being debated to date include the primary motivation of adolescents to initiate premarital sex at an earlier age in addition to the link between limited sources of sexual information and adolescent sexual behavior.[8] The previous research showed premarital sex behavior caused by continuous stimulation through sexual material in print media, the internet, and through peers.[6] Based on the Theory of Planned Behavior, Social Learning Theory, Diffusion of Innovation Theory, and Ideation Model, peers play an important role as the main determinant of behavior.

Adolescents who communicate with friends about sex tend to increase the incidence of premarital sex initiation among adolescents aged 14-16 years in Philadelphia.[9] Therefore it is essential to understand the influence of knowledge, attitude, and premarital sexual behavior and their relationship with social associating of adolescents in Makassar, Indonesia.

Materials and Method

This study was an observational analytic study with a cross-sectional study design to develop a model for controlling psychosocial development problems in adolescents in Makassar City. The time used in this study was 8 months. The location of the study conducted in high school students 17 & 19 in Makassar City. The population in this study was high school students 17 & 19 in Makassar City as many as 200 students. In this study, researchers used the proportionate random sampling method, with the Slovin sampling formula, which was sampling in the population by taking into account the strata or levels that exist and the number of samples as many as 134 people. The instrument used was a questionnaire to measure students' knowledge, attitudes, and actions toward premarital sexual behavior. Univariate analysis was conducted to get a general description of the research problem by describing each variable used in this study, namely by looking at the frequency distribution and percentage of each independent variable (Knowledge, Attitudes and Actions of premarital sex behavior) and the dependent variable (social environment) desired from the distribution table. Bivariate analysis was performed to see the relationship or correlation between the independent variable and the dependent variable. Data analysis was performed to determine the relationship of knowledge, attitudes, and actions towards the social environment by performing the Chi-Square test.

Results

Table 1: Results of Univariate Analysis for each Variable

Variables	Respondents	
	Frequency	Percent (%)
Knowledge		
Good	85	63.4
Poor	49	36.6
Attitude		
Positive	73	54.5
Negative	61	45.5
Action		
Risky	87	64.9
No risk	47	35.1

The results of the study in Table 1 showed that the knowledge group of premarital sex behavior found in the good knowledge group of 85 people or 63.4%, while the group with the poor knowledge is was 49 people or 36.6%. Most attitudes toward premarital sex behavior were in the positive attitude group with 73 people or 54.5%, while the negative attitude group was the smallest in the amount of 61 people or 45.5%. the Action toward premarital sex behavior in the risky category as many as 87 people or 64.9%, while the group action with no risk was 47 people or 35.1%.

Table 2: Results of Bivariate Analysis of Variables with Adolescents Association Environment in Makassar, Indonesia

Variables	Social environment	p-value
Knowledge	Towards friends	0.029*
	Towards family	0.210
	On personality	0720
	Towards sociable places	0.009*
	Against Social Media	0723
	Against hobbies	0723
	Towards the community	0.113
Attitude	Towards friends	0.034*
	Towards family	0864
	On personality	0.092
	Towards sociable places	0.020*
	Against Social Media	0.605
	Against hobbies	0.603
	Towards the community	0.241
Action	Towards friends	0.203
	Towards family	0.206
	On personality	0.559
	Towards sociable places	0.197
	Against Social Media	0.473
	Against hobbies	0.468
	Towards the community	0.003*

*Significantly at $\alpha = 0.05$

Table 2 shows that the results of the analysis of knowledge of premarital sexual behavior with the social environment of friends using Chi-square obtained p-value= 0.029 (p <0.05), this means that Ho was rejected and Ha was accepted. Then it could be interpreted that there was a relationship between knowledge of premarital sex behavior with the social environment of friends in High School students Makassar in 2019. The results of the analysis of knowledge of premarital sex behavior with the social environment of the place of association using Chi-square obtained p = 0.009 (p <0, 05), this means that Ho was rejected and Ha was accepted. Then it could be interpreted that there was a relationship between knowledge of premarital sexual behavior with the social environment of the place to hang out in High School students Makassar in 2019. While the results of the analysis of knowledge of premarital sexual behavior with the social environment of the family, personality, social media, hobbies, and communities have p-value> 0.005. this means that Ho was accepted and Ha was rejected. So it could be interpreted that there was no relationship between knowledge of premarital sex behavior with the social environment of family, personality, social media, hobbies, and communities in High School students Makassar in 2019.

The results of the analysis of premarital sex attitudes with the social environment towards friends using Chi-square obtained p = 0.034 (p<0.05), this means that H0 was rejected and Ha was accepted. Then it could be interpreted that there was a relationship between premarital sexual behavior attitudes with the social environment of friends in High School students Makassar in 2019. The results of the analysis of premarital sexual behavior attitudes with the social environment towards the place of association using Chi-square obtained p= 0.020 (p<0.05), this means that H0 was rejected and Ha was accepted. Then it could be interpreted that there was a relationship between premarital sexual behavior with the social environment of the place to hang out in Makassar City High School students in 2019. While the results of the analysis of premarital sexual behavior attitudes with the family environment, personality, social media, hobbies, and communities had p-value> 0.05. this means that H0 was accepted and Ha was rejected. Then it could be interpreted that there was no relationship between premarital sexual behavior attitudes with the social environment of family, personality, social media, hobbies, and communities in High School students Makassar in 2019.

The results of the analysis of premarital sexual behavior with the social environment of the community by using Chi-square obtained p=0.003 (p<0.05), this means that H0 was rejected and Ha was accepted. Then

it could be interpreted that there was a relationship between acts of premarital sexual behavior with the social environment of the community in High School students Makassar in 2019. While the results of the analysis of premarital sexual behavior with the social environment of friends, family, personality, hangout, social media, and hobbies had p-value> 0.05. This means that H0 was accepted and Ha was rejected. Then it could be interpreted that there was no relationship between premarital sexual behavior with the social environment of friends, family, personality, social, social media, and hobbies among students in High school Makassar in 2019.

Discussion

Relationship of Knowledge of Premarital Sex Behavior with Friends and Social Relationships: Behavior is a mental state or thinking and so on from someone to respond to situations outside the subject. These responses are two kinds that are active (with action) and passive (without action).Sex in Latin is *sexus*, which refers to the genitals. Sex only has an understanding of gender, anatomy, and physiology, whereas Sexual is somethingthat related to sex and reproduction also associated with the pleasure associated with reproductive actions.[10]

Sexual behavior can be defined as a form of behavior that is driven by sexual desire with the opposite sex or the same sex. According to Simkin, sexual behavior is any behavior that is driven by sexual desire with the opposite sex and with the same sex. This form of behavior varies from feelings of attraction to dating behavior, making out and having sex.[11]

Statistical test results using the Chi-Square test showed a relationship of knowledge about Premarital Sex Behavior with a social environment towards friends with a p-value=0.029 (<0.005) and the relationship of knowledge with the social environment to a social setting that was 0.009 means that there was a significant relationship between knowledge with the social environment towards friends and traveling environment to the place to hang out.

Knowledge is the result of knowing, and this happens after people sensing a certain object.[12] Good knowledge is supported by a good level of parental knowledge in providing information about premarital sex.[13]Half-knowledge is more dangerous than not knowing at all. The formation of knowledge itself is influenced by internal factors, namely the way individuals respond to that knowledge and externally which is a stimulus to change that knowledge for the better. Good knowledge is that respondents understand and understand about premarital sex.[14]

Relationship between Attitudes toward Premarital Sex Behavior with Friends and Social Relationships: Pre-marital sexual attitudes of adolescents are influenced by many things, apart from knowledge factors are also influenced by cultural factors, other people considered important, mass media, personal experiences, educational institutions, religious institutions, and emotions from within individuals. Adolescent premarital sexual attitudes can be positive or negative, the positive attitude of the action tendency is to support premarital sex while the negative attitude of the action tendency is to avoid adolescent premarital sex.[15]

Teenagers begin to prepare themselves for adult life, including in their sexual aspects. Thus it is necessary to have a wise attitude from parents, educators, and the community in general and of course the adolescents themselves, so that they can pass the transition period safely towards the hang out with p-value=0.020 (<0.005).

In adolescents, the influence of the environment in determining behavior is recognized as strong enough. Although adolescents have reached an adequate stage of cognitive development to determine their actions, adolescent self-determination in behavior is much influenced by pressure from peer groups.[16] It is not wrong if teenagers hang out with their peers, as long as their friends can make a positive contribution to the development of adolescents. It's just that there tends to be a problem if a teenager interacts with peers who have a free lifestyle and lack of parental supervision.

Relationship of Premarital Sex Acts with the Community Relationship Environment: Actions are rules that are carried out or hold rules to deal with something or an action. There is a close relationship between knowledge and attitude which is a tendency to act. Actions appear to be more consistent, harmonious, following the attitude when the individual's attitude is the same as the group's attitude, which he is part of or the group. This is following the theory of action that human actions arise from their consciousness as subjects and from external situations in positions as objects. As human subjects act or behave to achieve certain goals. Humans choose and evaluate the actions that will, are,

and have been done. Teenagers do actions based on purpose.

If it is associated with adolescent actions in premarital sex, it certainly will not be separated from what knowledge they have and how they are responding. It has been said before, that adolescents who have more knowledge about sex as a whole will be better able to control what will be done, the more teenagers get the knowledge about sexuality, the more careful they will be in their behavior and will have the ability to make decisions regarding their sexuality. Conversely, adolescents who lack understanding about sex will have sex before marriage without thinking. This knowledge is the beginning of someone in addressing and acting in premarital sex.

Based on these results because the actions of adolescents who engage in premarital sex, generally do negative things or things that lead to sexual deviations. According to Sarwono, this happened because of a shift in norms about sexual behavior among adolescents. Things that were considered taboo among adolescents in the 1950s such as kissing and joking are now even justified by today's teens. There is even a small percentage who agree on free sex. Not only that, but even many of them have also had sex. Teenagers who do this, are no longer lowering the views or opinions of society anymore.[17]

Based on the results of research that has been done, the relationship of adolescent actions has a significant relationship to the community's social environment. The social environment in this case the community is very influential on the actions of adolescents engaging in premarital sexual behavior because the strong influence of people around the community allows teens to commit deviant acts such as premarital sexual behavior. The impact of premarital sex on adolescent social life can be seen from the interaction of sex offenders premarital against others, as well as their educational conditions. This is consistent with statements regarding deviant behavior originating from subcultures or among deviant peers. Teenagers deviate because the social environment also deviates. Adolescents behave astray because they are more open with friends than with more mature people. The confirmation they received was wrong because they were looking for confirmation of the wrong person.[18]

Conclusion

This study concludes that there was a significant relationship between premarital sex knowledge with friends' social environment with p-value = 0.029 and also a significant relationship between knowledge and socializing with p-value = 0.009. There was a significant relationship between premarital sex attitudes with the social environment of friends with p-value = 0.034 and there was also a significant relationship between attitudes with the place to hang out with p-value = 0.020. There was a significant relationship between premarital sex action with the community's social environment with p-value = 0.003.

The advice given based on the results of this study is expected to provide socialization to adolescents to increase knowledge of psychosocial problems in adolescents specifically regarding premarital sexual behavior, as well as an intervention model that can control premarital sex in adolescents in the city of Makassar.

Health Literacy Associated with Raw Cyprinoid Fish Consumption in Northeastern Thailand

Tiwakron Prachaiboon[1], Pannee Banchonhattakit[2], Nathkapach Kaewpitoon Rattanapitoon[3,4], Surachai Phimha[5]

[1]Doctoral student in Public Health, Faculty of Public Health, Khon Kaen University, Thailand, [2]Associate Professor, Department of Public Health Administration Health Promotion Nutrition, Faculty of Public Health, Khon Kaen University, Thailand, [3]Assistant professor, School of Translational Medicine, Institute of Medicine, Suranaree University of Technology, Nakhon Ratchasima 30000, Thailand, [4]Assistant professor, Parasitic Disease Research Center, Suranaree University of Technology, Nakhon Ratchasima 30000, Thailand, [5]Lecturer, Department of Public Health Administration, Health Promotion, and Nutrition, Faculty of Public Health, Khon Kaen University, Thailand

Abstract

Background: Currently, more than 10 million people are at risk of liver fluke infection caused by *Opisthorchis (O.) viverrini* in Southeast Asia, particularly Thailand. The cause is the fish-borne diseases which result from the frequent consumption of undercooked fish.

Method: A cross-sectional analytical study was designed for one-year period. A total of 1,163 respondents at the age of 15-59 was chosen through the cluster random sampling.

Results: Health literacy including inadequate access health information (OR_{adj} = 2.05; 95%CI: 1.16 - 3.60, p<0.05), inadequate understand health information (OR_{adj}= 2.81; 95%CI: 1.46 - 5.43, <0.001) inadequate appraise health information (OR_{adj} = 2.35; 95%CI: 1.38 - 3.99, < 0.001) and inadequateapply health information (OR_{adj} = 4.32; 95%CI: 2.24 - 8.35, p<0.001), had statistical significance associated with raw cyprinoid fish consumption. In addition, feeding dogs and cats with raw cyprinoid fish (OR_{adj} = 4.94; 95%CI: 3.48 - 7.00, p<0.001)associated with raw cyprinoid fish consumption with statistical significance.

Conclusions: This study indicates that health literacy was associated with the raw cyprinoid fish consumption. Therefore, O.*viverrini* prevention and control should focus on their health literacy and change their eating behaviors, tradition, context, including feeding dogs and cats.

Keywords: *Health literacy, Raw cyprinoid fish consumption, Opisthorchis viverrini, Carcinogenic human liver fluke.*

Introduction

Neglected tropical diseases are caused by the most parasitic infections affecting health and poverty particularly in Southeast Asian countries, mainly including Thailand, Laos People's Democracy Republic (PDR), Cambodia, and central part of Vietnam in which there have been reported of liver fluke infection, *O. viverrini*.[1] There has been a population prone to liver fluke infection and their close relatives, constituting approximately 40.7 million people in worldwide. Common human liver fluke infection can be found among certain groups of individuals, divided into 9 million people suffering *O. viverrini* infection, 1.2 million people with*O. felineus* infection and 35 million people with *Clonorchis sinensis* infection.[2] *O. viverrini* infection is the main risk factor for cholangiocarcinoma

Corresponding Authors:
Dr. Pannee Banchonhattakit
Associate Professor, Department of Public Health Administration Health Promotion Nutrition, Faculty of Public Health, Khon Kaen University, KhonKaen, 40002, Thailand

and is often found in Northeastern Thailand and Laos since people continue to have the habit of extensive consumption of raw or half-cooked fish.[3,4] In Thailand, more than 6 million people are at risk of the liver fluke infection[5], which has been found to have the highest prevalence in the northeast (16.6%) and the north (10.0).[6] The *O. viverrini* infection was frequently found in male, agricultural occupations and in the age group over 35 years.[7] The infection results from the raw or under-cooked consumption of freshwater cyprinoid fish. Albeit well aware among many people that dosing with praziquantel is a treatment for an episode of the infection, it still poses a high risk for them to suffer long-term consequences, so eventually they will probably engage in a cycle of infection, dosing and reinfection.[5,8] However, prevention and control campaigns were launched nearly hundred years ago, so it resulted in a nationwide decrease of *O. viverrini* infection (8.7%).[5,6] Irrespective of such a substantial decrease, novel key success or new focus to eradicate *O. viverrini* or to decrease this infection in correspondence with the underlining requirement of Ministry of Public Health (less than 5.0%) is still in need.

Health literacy (HL) represents the cognitive skills and social skills which determine the motivation and ability of individuals to gain access to, understand and use information in ways which promote and maintain good health.[9] HL is a concept of healthcare, disease prevention, and health promotion settings. The ability includes: Access, Understand, Appraise and Apply. It is refers to the ability to communicate and use the information to make a decision to maintain and improve health.[10] HL refers to people's competencies to access, understand, judge and apply health information in healthcare, disease prevention, and health promotion by describing the level of HL and the factors associated with its population.[11] As a result, the risk of *O. viverrini* infection is posed by a habit of raw fish consumption. Despite its significance, it has been neglected; simply speaking, there is a dearth of studies of HL regarding liver fluke among *O. viverrini* infection risk groups in Northeastern Thailand. Therefore, this study aimed to investigate the HL associated with raw cyprinoid fish consumption in Northeastern Thailand. A large sample group was selected from the population among the 15-59 age group as representatives of the population-based cross-sectional study conducted in Northeast of Thailand. This study confirmed that HL and factors associated with liver fluke that will be useful for further disease prevention and health promotion.

Materials and Method

Study Design: This cross-sectional analytical study was conducted in Northeastern region, Thailand for one-year in 2019. A total population of 17,851 individuals who are living in three Province, Northeastern, Thailand, was included through cluster random sampling and completed self-administered questionnaires. Specifically, among that population, a total number of 1,829 respondents were selected through simple random sampling (Figure 1).

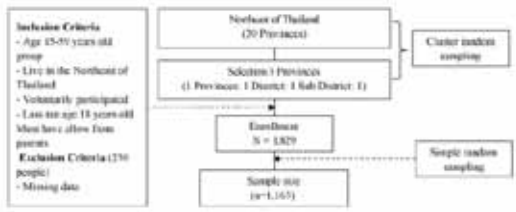

Figure 1. The inclusion flow chart of study design and sampling.

Questionnaires: The questionnaire was applied from the HLS-EU-Q Measurement of HL in Europe: HLS-EU-Q47. The questionnaire consisted of 4 parts, namely: 1) demographic characteristics, 2) knowledge about *O. viverrini*, 3) HL's 4 skills: access information, understand information, appraise information, apply information, and 4) Practice of *O. viverrini* infection. The questionnaire was validated by 7 experts and tested for its reliability. The Kuder-Richardson-20 coefficients of knowledge about *O. viverrini* question were 0.74. The Cronbach's alpha coefficients of HL and practice of *O. viverrini* infection were 0.87 and 0.76 respectively.

Statistical analysis: The primary outcome of this research was raw cyprinoid fish consumption in Northeastern Thailand. Multiple logistic regressions were used for analyzing the raw cyprinoid fish consumption and HL scores by crude, adjusted relative ratios (ORadj) and 95 % confidence intervals (CI). All analyses were performed using Stata version 10.0 (Stata Corp, College Station, TX). All test statistics were two-sided, and a p-value of less than 0.05 was deemed statistical significant.

Result

Demographic Characteristics: Among a total of 1,163 persons, a majority of them 54.34% were female, with a mean age of 42.68 ± 12.30 years old (ranged: 15-59), occupation as unemployed, a farmer and a laborer (85.47 %);, most of the family/monthly incomes were

below 5,000 baht (44.63%), alcohol consumption (47.21%), experience of using praziquantel (39.81%), and feeding dogs and cats with raw cyprinoid fish (30.01%).

Adjusted Odds ratios (OR) of raw cyprinoid fish consumption

The strongest factor that associated with raw cyprinoid fish consumption was access health information at the inadequate, followed by the understand health information at the inadequate, appraise health information at the inadequate, apply health information at the inadequate, gender in the male, occupation as unemployed, a farmer and laborer,family/ monthly incomes below 5,000 baht and those from 5,001 to 10,000 baht, alcohol consumption, experience of using praziquantel, and feeding dogs and cats with raw cyprinoid fish; all factors listed above were found to be significantly associated with raw cyprinoid fish consumption (Table 1).

Table 1. Odds ratios (ORadj) of raw cyprinoid fish consumption and their 95% confidence intervals for each factor adjusted for all other factors presented in the table using multiple logistic regressions

Discussions

HL represents the cognitive skills and social skills, a concept of healthcare, disease prevention, and health promotion settings, serving as an approach to promote and maintain good health.[9] This HL is in need of more understanding, particularly regarding *O. viverrini* infection among the population living in the endemic areas especially in the Northeastern region of Thailand which has reported with the highest prevalence of cholangiocarcinoma incident.[12] This new finding demonstrated that HL was associated with raw cyprinoid fish consumption. Previously studies indicated that raw cyprinoid fish consumption serves as an essential factor in reinfection and chronic infection of *O. viverrini* which would develop further to be cholangiocarcinoma, the cause of morbidity and mortality in the Northeast, Thailand and Laos PDR.[3,4,7] These findings showed that HL, namely the inadequate of access health information, understand health information, appraise health information, and apply health information, was significantly associated with raw cyprinoid fish consumption. That population group is prone to *O. viverrini* infection. Consistent with the health literacy, The low level of HL induced the poor self-management abilities in a wide range of older adults.[13] Meanwhile, people with the high level of HL can prevent liver fluke infection owing to have low prevalence in the endemic areas.[14] Cultivating and instilling high levels of literacy among a population not only is a vital development goal but will also produce substantial public health benefits.[15]

In addition, the present study found that feeding dogs and cats with raw cyprinoid fish was significantly associated with raw fish consumption. This result is in line with the prior study in that there was the association between *O. viverrini* infection in dogs, cats and their owners.[16] The cats that consumed raw fish were significantly more likely to be infected than those that consumed other foods.[17] These findings indicated that dogs and cats are the main reservoir host of *O. viverrini* that closely habituate with human and assumed that humans and their pets are also infection. Moreover, raw cyprinoid fish consumption was associated with used praziquantel among this population. This finding was consistent with previous studies that the factor as in previous use of praziquantel was related to *O. viverrini* infection.[3,8] Prevention and control of *O. viverrini* in the population at risk in endemic areas should also focus on the previous use of praziquantel. Furthermore, in respect of association between raw fish consumption and alcohol consumption, alcohol drinking serves as the risk factor of an increasing chance of suffering or acquiring *O. viverrini* infection.[18] Unfortunately, many people in the Northeastern region of Thailand misunderstand and assume that alcohol consumption can help eradicate *O. viverrini* during their raw cyprinoid fish consumption.[19] Health education for improving this risk group's HL is needed.

Demographic data including gender, occupations, family/monthly incomes and raw fish consumption were analyzed and found that males, occupation (unemployed, farmer and a laborer), family/monthly incomes (less than 5,000 baht)and (5,001 to 10,000 baht) were statistically significant. This result is in sync with other studies in that common infection was found in males, occupation (agricultural workers)[7,20] and income (<5,000 baht/ month).[3,21] This study indicates that family/monthly incomes were less than 10,000 baht.

Conclusions

This study showed HL was associated with raw

fish consumption, access healthinformation about *O. viverrini* infection, understand healthinformation about *O. viverrini* infection, appraise healthinformation about *O. viverrini* infection and apply healthinformation about *O. viverrini* infection. Furthermore, HL may serve as a desirable strategy for informing and modifying health behavior regarding *O. viverrini* infection in community health prevention, disease prevention, and health promotion among the risk group in Northeastern Thailand.

Nutrient and Cost Optimization in Menu Planning at an Apex Tertiary Care Hospital Using Operational Research Techniques

Vijay Kumar Tadia[1], Mahesh R.[2], Sidhartha Satpathy[3]

[1]Senior Resident Administrator, Department of Hospital Administration, AIIMS, New Delhi, India, [2]Additional Professor, Department of Hospital Administration, AIIMS, New Delhi, [3]Professor & Head, Department of Hospital Administration, AIIMS, New Delhi

Abstract

Introduction: Menu planning involves meticulous customised designing of nutrients to fulfill the dietetic needs of patients with various clinical profiles admitted in the Hospital. The goal of the diet problem is to select a set of foods that will satisfy a set of daily nutritional requirement of patients at minimum cost. Various tools and techniques of applied simulation models in Operational Research are available to optimize the cost as well as quality of food.

Methodology: The study based on exploratory research design was conducted at Dietetics Department of an apex tertiary care hospital in India. It was based on an exploratory research design. The LPSolve programming language was used to analyse the data and generate the output. Integer Programming determined the most nutritious meals while considering the constraints of the RDA by ICMR. The Nutritive Value of Ingredients per 100 grams was obtained from the Nutritive Value of Indian Foods (2012) published by NIN, ICMR.

A model was formulated using the notations, N for the total number of dishes available, *ci* for the Cost of ith dish, where i = 1,2,3,……N, *xi* for the decision variable, LB for the Lower Bound of nutrition intake, UB for Upper Bound of nutrition intake, n for the Number of dishes required per day and T for the Total types of food, the following equations were used.

Objective Function: Minimize the total cost F, $F = \sum_{i=1}^{N} c_i x_i$

Constraint 1: Daily constraints $LB \leq \sum_{i=1}^{N} Nutrients(x_i) \leq UB_i$; where i=1, 2…….N

Constraint 2: $\sum_{i=1}^{T} Type\ of\ foods(x_i) = n_i$ where i= 1, 2, 3…….T

Results: It was found that the Indian recipes fail to provide the minimum RDA of Vitamin A and Vitamin B6 and therefore, the lower bound had to be reduced significantly for these Vitamins.

Conclusion: The application based on operational research techniques can be further developed to be deployed across different hospitals. This would help to not only to provide the RDA but also ensure that it is done at a lower cost.

Keywords: *Nutrient optimization, Cost Optimization, Menu Planning.*

Introduction

Menu planning involves meticulous customised designing of nutrients to fulfil the dietetic needs of patients with various clinical proiles admitted in the Hospital. The goal of the diet problem is to select a set of foods that will satisfy a set of daily nutritional requirement of patientsat minimum cost[1]. Various

tools and techniques of applied simulation models in Operational Research are available to optimize the cost as well as quality of food.

In this study, the diet problem has been formulated as a linear program of Operations Research where the objective was to minimize cost and the constraints were to satisfy the specified nutritional requirements in the diet. The diet problem constraint typically regulate the number of calories and the amount of vitamins, minerals, fats, sodium, and cholesterol in the diet[1].

The process of decision making in the Menu Planning is complex. It involves multitude of factors that have to be taken into account while doing the menu planning exercise[2].

The diet problem was one of the first optimization problems studied in the 1930s and 1940s. Early researchers to study the problem was George Stigler, who made an educated guess of an optimal solution using a heuristic method[3].

Operations research is a discipline that deals with the application of advanced analytical method to help make better decisions[4]. It involves techniques from other mathematical sciences, such as mathematical modeling, statistical analysis, and mathematical optimization, operations research arrives at optimal or near-optimal solutions to complex decision-making problems[4].

Linear programming (LP) (also called linear optimization) is a method to achieve the best outcome (such as maximum profit or lowest cost) in a mathematical model whose requirements are represented by linear relationships. Linear programming is a special case of mathematical programming (mathematical optimization)[5].

Need for the Study: Advancement in the field of medicine has increased the chances of survival of patients with a variety of diseases that were considered incurable earlier. The prevalence of malnutrition has been estimated to be as high as 50% among acutely hospitalized adults, depending on the definition employed and the population assessed[6,7,8]. Malnutrition is consistently associated with adverse clinical outcomes, including increased morbidity, mortality, and length of hospital stay as well as reduced quality of life[9,10,11,12]. Various diseases commonly found in patients cause stress on the body and bring about changes in substrate metabolism, thus leading to the deficiency of various nutrients. The incidence of malnutrition is significant in critical, particularly in highrisk patients[13]. It is essential to identify malnourished patients and also patients at increased risk of malnutrition in order to devise a comprehensive nutrition care program. Nutrition societies across the world recommend nutrition screening tools to assess malnutrition in hospitalized patients, such as the Mini Nutritional Assessment (MNS) tool[14]. Chakravarty et alconcluded that almost two-fifth of admitted patients were malnourished in tertiary care hospital and there was an urgent need to develop a comprehensive nutritional care program. A study by Kowanko et al,concluded thatalthough nurses considered nutritional care to be important, many had difficulty in raising its priority above other nursing activities, as a result of time constraints and multitasking issues[15].So, there should be a system for nutritional assessment of all admitted patients and special individualized plan should be set. Reid and Allard-Gould reported that adequate nutritional screening and interventions have been demonstrated to be cost-effective resulting in fewer complications, faster recovery, shorter hospital stays and reduced hospital expenditures[16]. The value of nutrition therapy for the adult hospitalized patient is derived from the outcome benefits and the nutritional assessment should identify those patients at high nutritionalrisk, determined by both disease severity and nutritional status[17]. A NABH standard on Care of Patients (COP.19) talks about the nutritional therapy to be provided to patients consistentlyand collaboratively.[18] Taking into consideration the factors mentioned above this study was conceived

Methodology

The study based on exploratory research design was conducted at dietetics department of an apex tertiary care hospital in India. The LPSolve programming language was used to analyse the data and generate the output. Integer Programming determined the most nutritious meals while considering the constraints of the RDA by ICMR. The Nutritive Value of Ingredients per 100 grams was obtained from the Nutritive Value of Indian Foods (2012) published by NIN, ICMR.

The RDA for Indians as provided by ICMR[19] is given in Table 1 and Table 2 below.

Girls	13-15 years			1.2	1.4	14	2				210	11
Boys	16-17 years			1.5	1.8	17	2	40	200		195	12
Girls	16-17 years			1	1.2	14	2				235	12

Model Formulation: The objective of this study was to formulate a menu planning model that minimizes the cost and tries to achieve the maximum nutritional requirement based on the Indian RDA requirements.

Integer Programming was used to determine the most nutritious and palatable meals, while considering the constraints of the RDA, the cost of the menu items, the budget at hand as well as requirement of variety of food items. Various permutations and combinations to optimise the menu in terms of Calories required by patients as well as the efficiency in terms of Cost were put to test.

Notations Used:

N = Total number of dishes available

C_i = Cost of ith dish, where i = 1,2,3,……..N

x_i = decision variable

LB = Lower Bound of nutrition intake

UB = Upper Bound of nutrition intake

n = Number of dishes required per day

T = Total types of food

Objective Function:

Minimize the total cost F,

$$\mathbf{F} = \sum_{i=1}^{N} c_i x_i$$

Constraint 1:

Daily constraints

$$\mathbf{LB} \leq \sum_{i=1}^{N} Nutrients(x_i) \leq \mathbf{UB;}$$ where i = 1, 2, …….N

LB and UB are the vectors, give different value for each nutrient. This is to ensure that we meet the nutrients requirements. The details are shown in Table 3.

Constraint 2:

$$\sum_{i=1}^{T} Type\ of\ foods(x_i) = \mathbf{n;}$$ where i = 1, 2, 3…….T

This constraint makes sure that daily number of dishes/servings required must be fulfilled. The details are given in Table 4.

Data required:

1. **For Objective function:** Cost of each dish/serving in Rupees (C_i): Set to a random number as cost of the ingredients vary fortnightly as per rate list sourced at AIIMS
2. **For Constraint 1:**

Table 3: Data required for constraint 1

Nutrients	Lower Bound (LB)	Upper Bound (UB)	RDA
Energy (Kcal)	2050	2600	2320
Protein (g)	50	100	60
Fat (g)	20	100	25
Calcium (mg)	550	2000	600

Nutrients	Lower Bound (LB)	Upper Bound (UB)	RDA
Iron (mg)	14	30	17
b-carotene (mcg)	600	6000	4800
Thiamine (mg)	1	3	1.2
Riboflavin (mg)	0.5	2	1.4
Niacin (mg)	10	20	16
Pyridoxin (mg)	0	4	2
Ascorbic acid (mg)	30	200	40
Dietary folate (mcg)	150	250	200

3. For Constraint 2:

Table 4: Data required for Constraint 2

Type of food (T)	No. of requirement per day (n)
Breakfast	1
Dal-Vegetables	2
Roti	4
Rice	1
Dessert	1
Beverage	2

Results and Discussion

Outputs: After input of the required parametres, the output in form of an excel sheet was created based different permutations and combinations. The output had menu for the entire week and the nutrient information and cost per day (Table 5).

Table 5: Nutrient and cost information for the planned diet

	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday	Sunday
Energy (Kcal)	2407.44	2285.36	2448.44	2298.46	2192.43	2054.65	2158.00
Protein (g)	71.96	67.88	50.08	71.59	57.70	69.55	50.69
Fat (g)	70.05	84.59	32.13	96.55	46.03	58.25	97.37
Calcium (mg)	1093.50	1858.90	583.25	822.44	613.16	1318.66	594.55
Iron (mg)	18.79	23.25	18.94	23.54	20.02	19.13	19.62
Carotene (mcg)	640.31	5781.88	641.03	1018.39	741.59	642.04	640.51
Thiamine (mg)	1.49	1.14	1.18	1.59	1.25	1.09	1.36
Riboflavin (mg)	1.16	0.50	0.67	0.61	0.79	0.62	0.76
Niacin (mg)	14.00	10.64	10.99	11.66	13.03	10.24	10.77
Total B6 (mg)	0.14	0	0	0	0.06	0.017	0
Vitamin C (mg)	67.08	90.59	78.57	68.8	56.49	35.82	31.61
Folic Acid (Total) (mcg)	176.12	188.73	152.20	150.04	153.86	157.01	196.05
Price (Rs.)	59.77	94.69	121.86	110.17	126.58	133.60	151.61

The table above shows the nutrient and cost information for the planned diet for a week. The energy requirements are being met on all the days of the week i.e, it falls between the acceptable range of 2050 Kcal to 2600 Kcal. There is a variation in provision of other nutrients over the period of week especially Carotene

availability varies widely from 640.30 mcg to 5781.88 mcg. The result must be read in the ontext of week as a unit for which the menu is planned. If we consider the week as a unit, then the nutrient requirements are generally met as required. In the instances of average length of stay ≤6/7 days, there is scope to counsel the patient to avail the nutrients in home diet. There were certain limitations, though, to meet all the nutritional needs as discussed later in this article.

Traditionally, in resource constrained healthcare institutions, the Dieticians plan the menu manually. The process of manual planning has no or less scope to involve all consummables vis-à-vis its nutrient values and the amount to be used in the end product to be served to the patient keeping the cost in mind.

A better alternative solution is the concept of Constraint Programming thacan be applied to the diet planning system effectively.[20]. Mathematical modeling using linear programming may be applied to problems related to optimized resource allocation in healthcare and could be a useful tool to support decision-making processes in healthcare. [21]

Comparaive research studies of such experimentation on optimizing the Nutrient & Cost of the diet in such a bigger healthcare institution are not found.

The prototype suggested in this study could be further improved. The optimization based on cost and budget can be done and the menu based on the daily budget defined by the user could generate output within the RDA limits. The Machine Learning can be used to provide relaxation to the limits of RDA to make generation of result much easier and faster. Further, Cloud Based Server can keep on updating the data based on the prevalent market price of commodity based on the geographical region and thus tailormade solutions can be derived.

Limitations of the Study:

1. It was found that the Indian recepies fail to provide the minimum RDA of Vitamin A and Vitamin B6 and therefore, the lower bound had to be reducued significantly (Table 3).
2. While ICMR RDA mentions requirements for Retinol, Vitamin B12, Magnesium and Zinc, the data for the ingredients was not available. On the other hand, Crude fiber and Phosphorous related data for the ingredients is there but the RDA requirement is not mentioned. Therefore, these nutrients were kept out of the ambit of the present study.

Picture Archiving and Communication Systems (PACS): A Pre-Post Comparative Analysis

Vijay Kumar Tadia

Senior Resident Administrator, Department of Hospital Administration, AIIMS, New Delhi

Abstract

Background: A picture archiving and communication systems (PACS) is a computerised means of acquiring, storing, transmitting and displaying images digitally. PACS is a standard component for radiology information systems.

Method: A comprehensive descriptive and observational study was undertaken at two tertiary care hospitals from April 2012 to December 2012, the main hospital and an associated hospital. The main hospital had the functional RIS and PACS while PACS was being installed in the associated hospital. So, the main hospital represented Post-PACS scenario and the associated hospital represented Pre-PACS era. The data was collected from the Radiology Information Systems and the PACS Servers. The historical data was obtained from secondary sources. Simple random sampling was used to select cases for the calculation of average waiting time and report TAT for examinations on different modalities.

Results: The findings showed improvement in the TAT following PACS implementation at Main Hospital. A noteworthy improvement had been in the case of X-ray unit which had declined considerably from the peak value of 6.8 days in the year 2006 to 2.2 days in the year 2011. In the case of USG, the TAT had reduced and the reports were available on the same day with an average TAT of 0.5 days. In the case of CT, the TAT reduced by more than 50% to 1 day on an average. In the case of MRI, the TAT reduced from 3 days in the year 2004 to 2.4 days in the year 2011. On the other hand, the TAT in case of Associated Hospital was higher in almost all the modalities.

Discussion and Conclusion: It may be concluded that the introduction of PACS in Main Hospital had paid the dividends and the decision to install and implement the PACS in Associated Hospital was pragmatic one.

Keywords: *Picture Archiving and Communication Systems (PACS), Operational efficiency, RIS.*

Introduction

A picture archiving and communication systems (PACS) is a computerised means of acquiring, storing, transmitting and displaying images digitally.[1] PACS is a standard component for radiology information systems.[2] It has fecilitated the management of images easier for healthcare organizations[3]. New technologies are sometimes easily accepted in healthcare organizations to improve service quality and efficiency [4]. Though PACS has fundamentally changed healthcare landscape, it proves to be a real challenge for many healthcare organisatins[5,6]**.** The procurement of PACS is a major financial investment and its implementation has a long-term effect on the daily operations of organisation.[7] The evaluation of PACS implementation has been conducted from various perspectives.[8] The impact of PACS on the overall efficiency of imaging services has been calculated to reduce the cost per image.[9] Many studies point out that the user acceptance is an essential tool before implementing PACS as it determines the success rate to a large extent.[2]

Method

A comprehensive descriptive and observational study was undertaken at two tertiary care hospitals from April 2012 to December 2012. These tertiary care hospitals (main hospital and an associated hospital) were located at different locations in the same city and were managed by single administrative set up. The main hospital had the functional RIS and PACS while PACS was being installed in the associated hospital. So, the main hospital represented Post-PACS scenario and the associated hospital represented Pre-PACS era. The data was collected from the Radiology Information Systems and the PACS Servers. The historical data was obtained from secondary sources. Simple random sampling was used to select cases for the calculation of average waiting time and report TAT for examinations on different modalities. Data was analysed by using Microsoft Office Suite.

Results

The radiology departments at both the hospitals were well equipped to provide the full range of diagnostic imaging services including Computerized Radiography, Ultrasonography (USG) & Colour Doppler, Multi slice Computed Tomography (CT), Magnetic Resonance Imaging (MRI), Mammography and Interventional radiology. Images from these modalities were stored on PACS (Picture Archival and Communication System) in the main hospital.

Though the PACS was installed in the main hospital in the year 1999 but the integration of various modalities with PACS could be achieved by the year 2005. So, the data was perused after the year 2006 onwards for analysis. The PACS was still under the process of installation and implementation in associated hospital. The main hospital represented Post-PACS phase and associated hospital represented Pre-PACS phase.

Before the implementation of PACS in main hospital, the examination was followed by approximately an hour long process of film development which was further followed by the sorting of the previous images before the patient folder could reach the radiologist. Post PACS, this had been replaced by a five minute activity of processing a plate, containing a cassette with patient details, and the screen containing image, in the CR processor and transmitting the image to PACS by a technician.

The operational efficiency of HMIS/RIS and PACS was gauged from the workload handled, the average examination waiting time and the average report turnaround time.

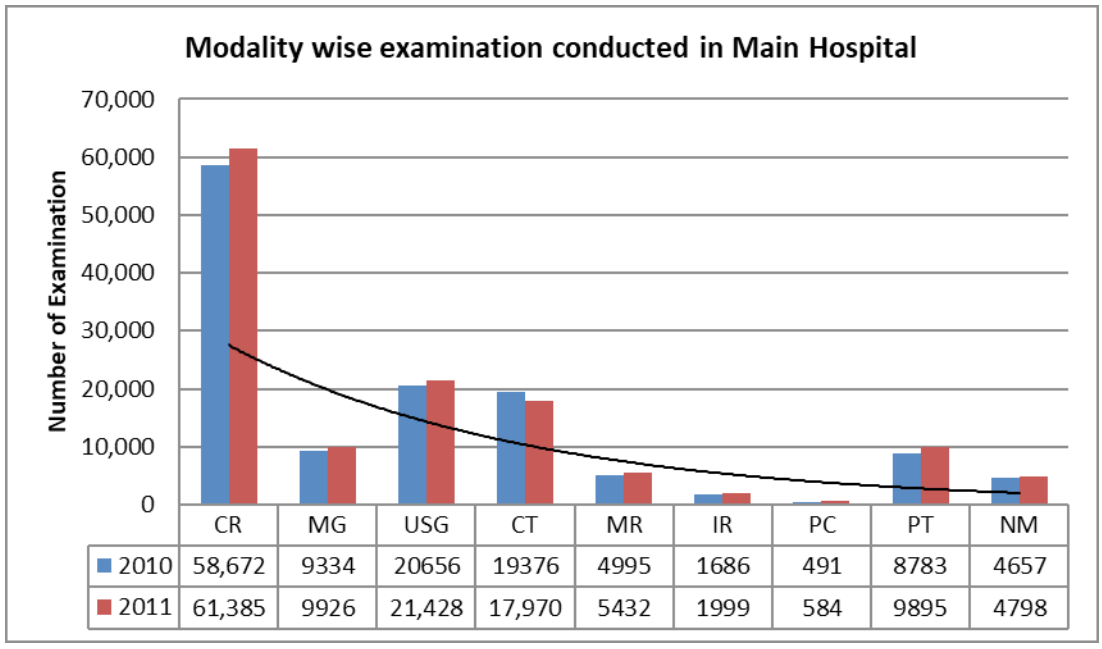

Figure 1. Modality wise Examinations conducted for the Years 2010 & 2011 in Main Hospital

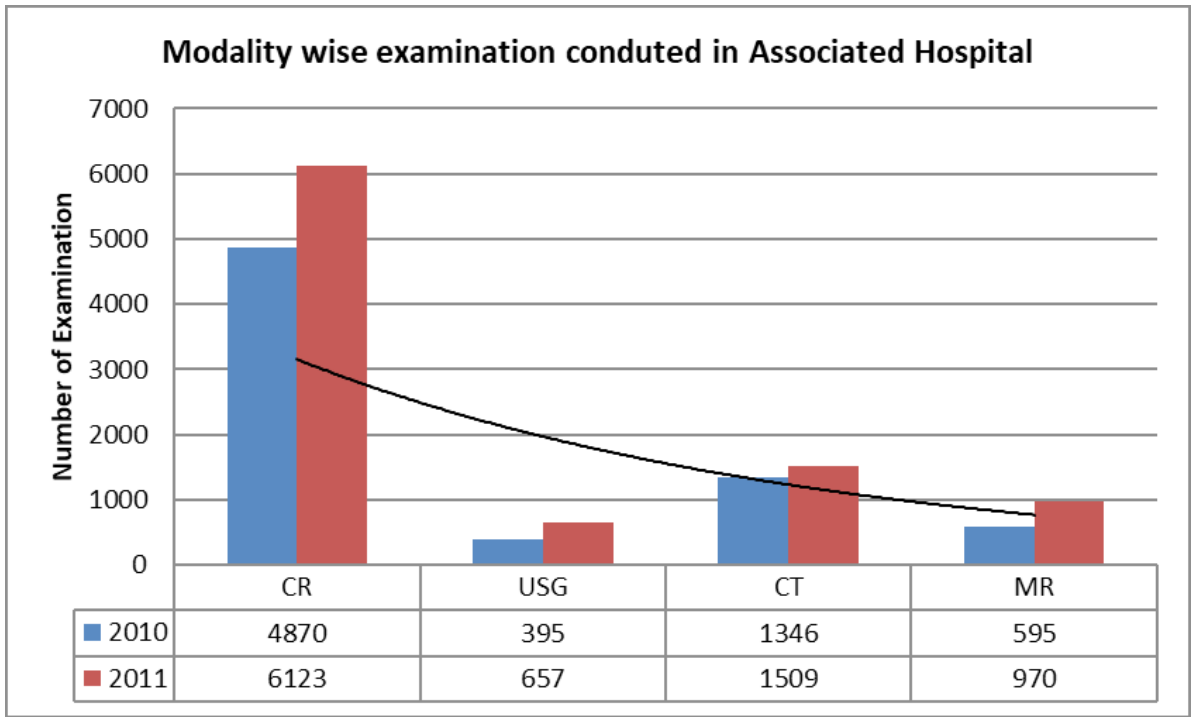

Figure 2. Modality wise Examinations conducted for the Years 2010 to 2011 in Associated Hospital

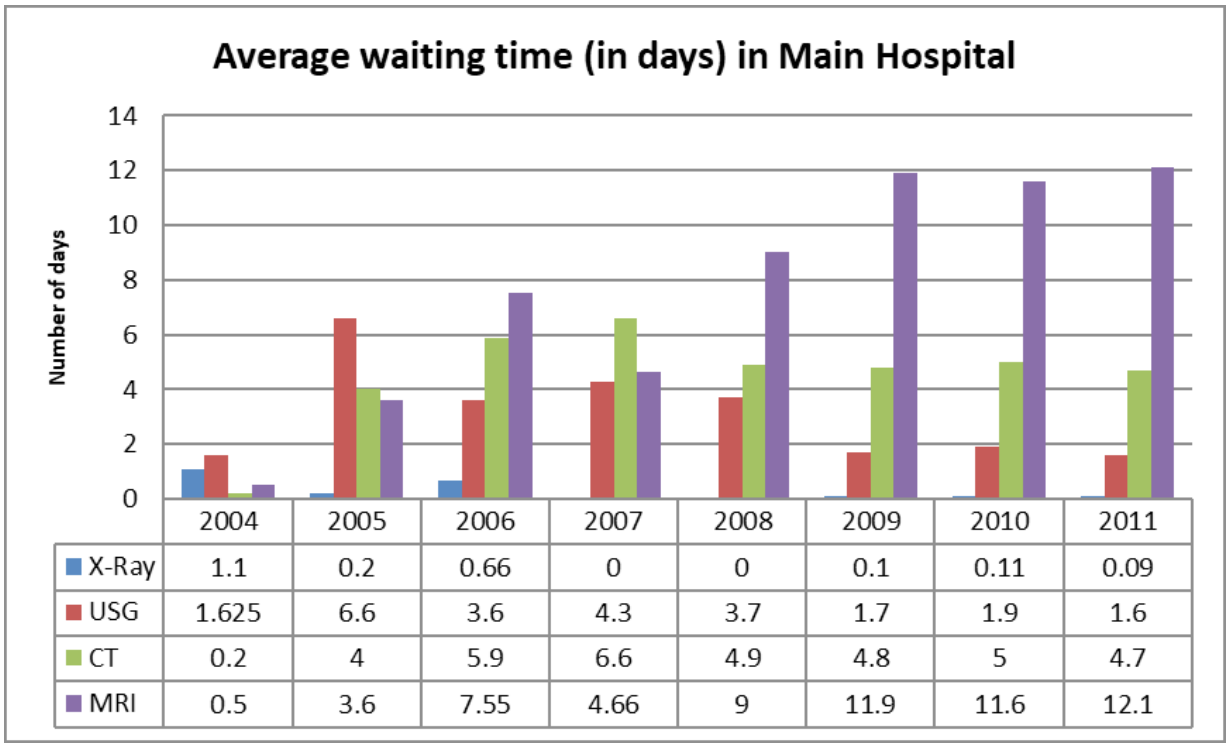

Figure 3. Average Examination Waiting Time (in Days) in Main Hospital

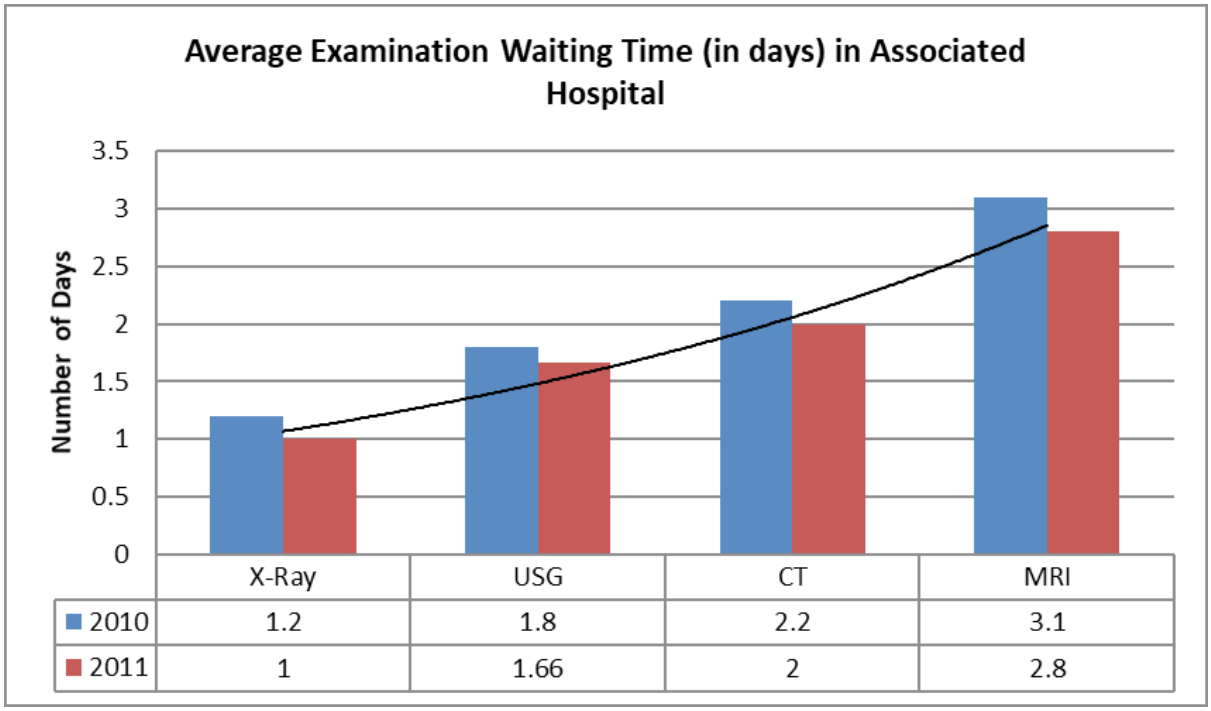

Figure 4. Average Examination Waiting Time (in Days) in Associated Hospital

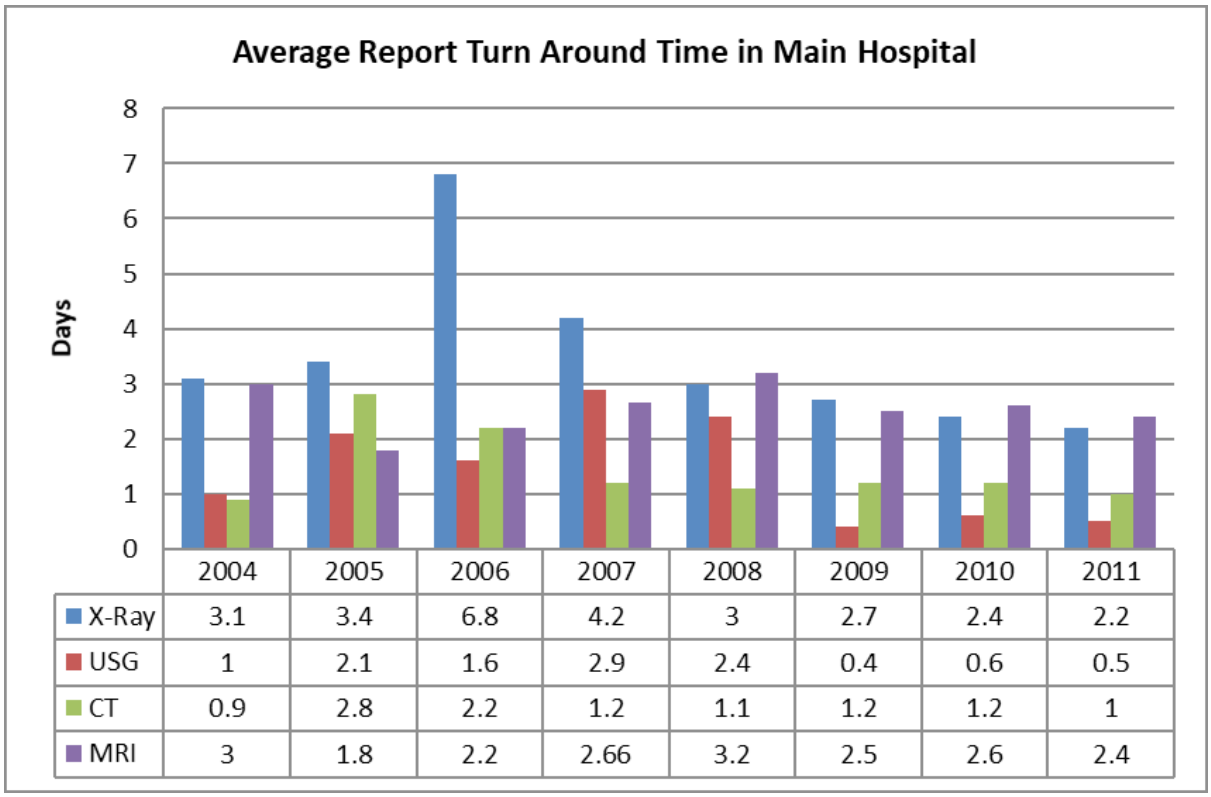

Figure 5. Average Report Turnaround Time (in Days) in Main Hospital

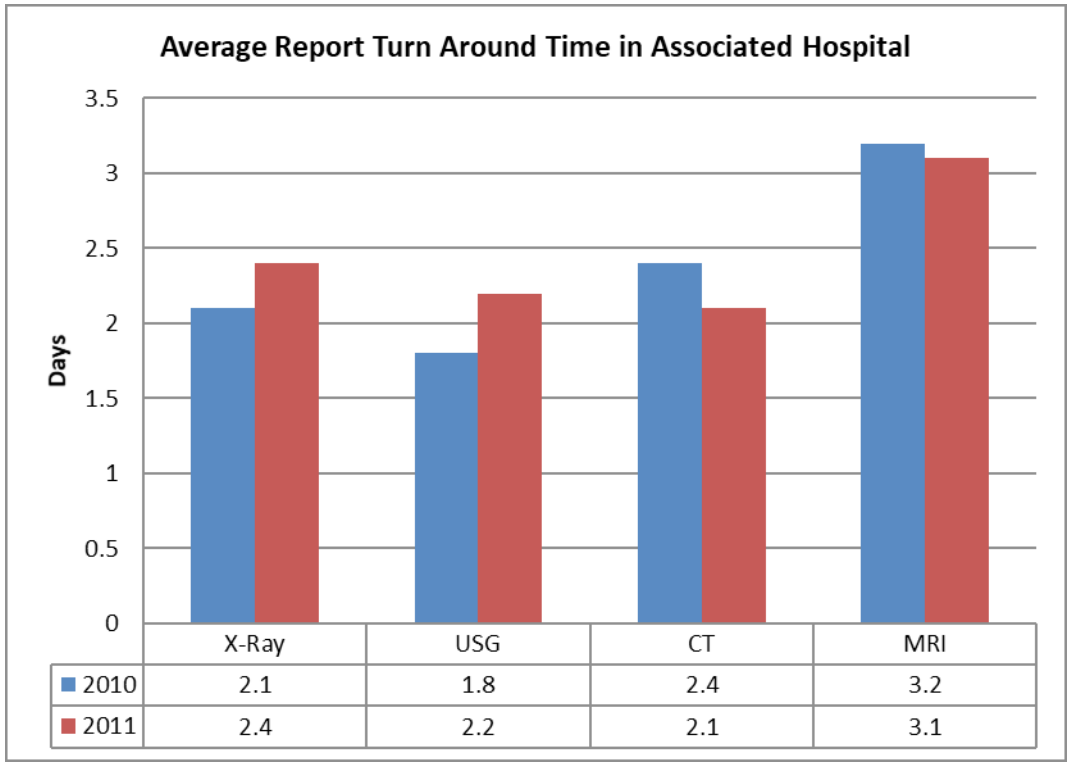

Figure 6. Average Report Turnaround Time (in Days) in Associated Hospital

The findings showed improvement in the TAT following PACS implementation at Main Hospital. A noteworthy improvement had been in the case of X-ray unit which had declined considerably from the peak value of 6.8 days in the year 2006 to 2.2 days in the year 2011. In the case of USG, the TAT had reduced similarly and the reports were available on the same day with an average TAT of 0.5 days. In the case of CT too, the TAT had reduced by more than 50% to 1 day on an average. In the case of MRI, the TAT had reduced from 3 days in the year 2004 to 2.4 days in the year 2011.On the other hand, the TAT in case of Associated Hospital was higher in almost all the modalities. It may be concluded that introduction of PACS in Main Hospital had paid the dividends and the decision to install and implement the PACS in Associated Hospital was a pragmatic one.

Discussion and Conclusion

PACS is an integral part of the radiology department of a hospital.[10] Many studies have revealed the reduction in the turnaround time post PACS installation.[11] PACS leads to reduction in waiting time, average length of stay as it speeds up the phases of diagnostic process and reduces the time needed to obtain radiological results.[12] The impact of PACS on the overall efficiency of delivering imaging services revealed a reduction in the cost per image produced in the face of increasing demand for the service.[9]

PACS will play an important role in the total digital conversion in healthcare, and will improve the quality of patient care delivered to a large extent and lead to the faster decision making.[13] It leads to the reduction in repetitive data entry at different levels. There are significant changes in physician diagnostic behavior after PACS implementation.[14]

The addition of PACS improved availability of alphanumeric preliminary reports of abdominal and pelvic CTs on the HIS, by 85.0%. There was no gross perceived impact with a PACS on the time to final sign reports by a radiologist as signing patterns remained relatively constant over the two interpretation formats. This improvement in turnaround times can be used in justifying PACS.[15]

The study revealed that there was an improvement in the TAT following PACS implementation at Main Hospital. A noteworthy improvement had been seen in the case of X-ray USG, CT and MRI. The TAT in case of Associated Hospital was higher for almost all the

modalities. This was, infact, the reflection of Pre-PACS era in case of Main Hospital. It may be concluded that the introduction of PACS in Main Hospital had paid the dividends and the decision to install and implement the PACS in Associated Hospital was pragmatic one.

Medico Legal Documentation in a Public Hospital in India: An Analysis of 100 Cases

Vijay Kumar Tadia[1], Paresh Shekhar Jangale[2]

[1]Senior Resident Administrator, AIIMS, New Delhi, [2]MHA, TISS, Mumbai

Abstract

Introduction: Medico-legal audits are an integral part of hospital/clinical audits and involve examination of the hospitalrecords. The clinical audits aim towards improvement of quality of care and hence are limited to the scrutiny of patient's clinicalrecords. On the other hand, a medico-legal audit aims at the prevention of foreseeable litigations on the hospital and includes the perusal of all the hospital records.

Aim & Objective: To carry out the audit of medico legal documentation in a public hospital.

Methodology: A retrospective record-based study was conducted in a 2000 bedded public hospital in the month of May-June 2012. 100 documented medico legal cases were considered using simple random sampling. The quantitative data was collected by using a checklist for the audit of medico legal case files. SPSS was used for the analysis of the data.

Results: Most of the MLC cases were found to fall in the middle age group of 21-35 years of age (32%) and within that the maximum people contributing to the MLC cases was the sub- group of age between 21-25 years (16.66%). Out of the total recorded sex of the MLC cases, 65.96% were males and 34.04% were females. The highest number of cases recorded were of the RTA (20%) followed by the accidental injury (17%).

Discussion & Conclusion: Alarge number of the cases were of the road traffic accidents (20%)followed by accidental injury (17%), so the emergency department should be kept well equipped to treat such cases. The proportion of the male patients (65.96%)was double as compared to the female patients (34.04%), so the human resource planning of the emergency department can be done accordingly.

Keywords: *Medico legal cases, Medical Records, Medico legal record audit, Good Record Keeping*

Introduction

A high standard of medical record keeping is important for safe patient care and provides information for research, audit and medicolegal purposes.[1]

An MLC is a case of injury/illness where the attending doctor, after eliciting history and examining the patient, thinks that some investigation by law enforcement agencies is essential to establish and fix responsibility for the case in accordance with the law of the land.[2,3]

Documentation is regarded as an essential element in the legal system of country.[4]

Medico-legal audits are an integral part of hospital/clinical audits and involve examination of the hospitalrecords. The clinical audits aim towards improvement of quality of care and hence are limited to the scrutiny of patient's clinicalrecords. On the other hand, a medico-legal audit aims at the prevention of foreseeable litigations on the hospital and includes theperusal of all the hospital records.[5]

Aim & Objective: To carry out the audit of medico legal documentation in a public hospital.

Methodology

A retrospective record-based study was conducted in a 2000 bedded public hospital in the month of May-June, 2012. 100 documented medico legal cases were considered using simple random sampling. The quantitative data was collected by using a checklist for the audit of medico legal case files. SPSS was used for the analysis of the data.

Results

1. Recording of the age of the patient: It was been found that the age of the patient was recorded in 98% of the cases.
2. **The proportion of the Medico-Legal Cases (MLCs) according to age:** Most of the MLC cases were found to fall in the middle age group of 21-35 years of age (32%) and within that the maximum people contributing to the MLC cases was the sub-group of age between 21-25 years (16.66%).
3. **The recording of the sex of the patient:** The sex of the patient was found to be recorded in the 94% of the MLC cases. Out of the total recorded sex of the MLC cases, 65.96% were males and 34.04% were females.
4. **Cause of the medico-legal cases:** It was observed that diagnosis was written on all the case files (100%). The highest number of cases recorded were of the RTA (20%) followed by the accidental injury (17%), a considerable amount of MLCs were recorded when a patient was shifted from a private hospital to the public hospitals (12%).
5. **The Length of stay of a MLC patient**: Most of the MLC patients stayed for 1to 5 days in the hospital (48%) followed by stay between 6 to 10 days (23%). The Average Length of Stay (ALOS) of the MLC patient in the hospital was 11 days.
6. **Recording of the time of the injury:** The time at which injury happened was recorded in 48% of the cases,it was not recorded in 38% of the cases. The question was not applicable for 14% cases.
7. **Recording of the time at which patient reported to the hospital:** The time at which the patient reported to the hospital was recorded in 99% of the cases and the record was found to be missing in 1 case.
8. **Record of the person accompanying the patient to the casualty**: In majority of the cases, the details of how the patient was brought to the casualty and who was accompanying him/her were not recorded(55%).In the cases where such information was recorded(45), the 93 % of the cases were accompanied by relatives and the rest 7 % were accompanied by the police.
9. **Record of the mental status:** The mental status of the MLC patient was recorded in 46% of the cases and was found missing in rest of the cases (54%).

   The majority of the patients who presented to the casualty were conscious (74%), who were in a condition to give the statement at the time of admission while there is were also considerable number of the patients who were not in the condition to give the statement(Semi-Conscious 6.5% & Unconscious 19.5%).
10. **Record of physical injury**: In 70 % of the cases, some form of physical injury was present. In considerable number of the cases there was absence of description of injury with respect to its Type (18.57%), Dimensions (68.58%) and Diagrammatic Representation (44.29%).
11. **The proportion of the MLC cases discharged against medical advice (DAMA):** It was found that 11% of MLC patients were discharged against medical advice (DAMA) but the reasons for the same were not recorded even in one case.
12. **Record of the Occupation of the MLC**: The occupation of the MLC patients were recorded in only 3% of the cases.
13. **Record of the Complaints, History, Pulse and Blood Pressure**

In large number of MLCs, the documents were lacking the recording of the pulse (49%) and the Blood pressure (64%) of the patient. The presenting complaints were not recorded in 2% cases and history was not written in 3% of the cases.

Discussion & Conclusion

It was found that in many cases the relevant information was found missing or was not recorded while documenting the medico legal case. The court of justice can ask for any data at any point and can even punish the hospital for not maintaining the records of the patient properly. Medical records are acceptable as per

Section 3 of the Indian Evidence Act, 1872 amended in 1961 in a court of law. These are considered as useful evidence by the courts of law as it is accepted that documentation of facts during the course of treatment of a patient is genuine and unbiased.[6]

A large number of the cases were of the road traffic accidents (20%)followed by accidental injury (17%), so the emergency department should be kept well equipped to treat such cases. The proportion of the male patients (65.96%) was double as compared to the female patients (34.04%), so the human resource planning of the emergency department can be done accordingly.

The time at which injury happened was recorded in 48% of the cases. As time at which an injury or an event happens is of great medico legal importance, the recording should be made mandatory for the medical officers.

A considerable number of the patients were not in the condition to give the statement at time of admission (26%), the CMOs should visit them again to elicit history.

A study by Bart S Selden et al considered the history, physical examination, vital signs, mental status, mental impairment and patient refusing care by paramedics in out hospitals.[7]

Sangeeta Regge et al in a study concluded that due to ambiguity in the understanding the MLC, more and more health care professionals are looking at MLC as a burden and hence leading to practice of defensive medicine. Their study suggested that there was a need of standard operating procedures in the context of doctors, nurses and police and their respective medicolegal roles.[8]

An audit of operative notes revealed that several operative notes were found incomplete (51.57%) missing important information as CMB code (13.68%), patient details (6.8%) preoperative diagnosis (6.31%), operation title (6.31%) and postoperative instruction (14.73%). Overall, only 92 notes were complete.[9]

A study on good medical record keeping revealed that the Standards measured increased over the 3 audit cycles with 3 of the indicators (writing a date, patient name and hospital number) reached 100%. These results indicate medical note keeping has scope for improvement and auditing can improve standards.[10]

It maybe easy to state that medico-legal audit has its genesis in 'defensive medicine', but in the era of patient's awareness and judicial litigations, it must be integrated to the functioning of the health care systems.[5]

Evaluation of Radiology Information Systems including PACS at Two Tertiary Hospitals in India from User's Perspective

Vijay Kumar Tadia

Senior Resident Administrator, Department of Hospital Administration, AIIMS, New Delhi

Abstract

Today there has been growing global emphasis on the need for Hospital Management Information Systems (HMIS). Plethora of studies have shown the benefits of implementing HMIS. The RIS is a subset of HIS which is smaller in scale.

Method: A comprehensive descriptive qualitative study was undertaken from April 2012 to December 2012. The study setting involved two tertiary care public hospitals (main hospital and an associated hospital) located at different and distant locations in the same city. All the consultants in the department of radiology (11) were interviewed except one who was not available during the period of study and Convenience sampling was used to select other Key Informants. A Structured questionnaire was used to evaluate various aspects of RIS & PACS from the end user's perspective.

Results: Overall performance of RIS at main hospital was rated as Satisfactory by 55 percent, neutral by 35 percent and very satisfactory by another 10 percent of the respondents.

Overall performance of RIS at associated hospital was rated as Dissatisfactory by 25 percent, neutral by 70 percent and satisfactory by rest i.e., 5 percent.

Discussion and Conclusion: The user feedback is very important for the success of Hospital Management Information Systems, Radiology Information and PACS. The end user should be involved in the decision to introduce technology at the hospital

Keywords: *Hospital Information Systems, Radiology Information Systems, PACS.*

Introduction

Today there has been growing global emphasis on the need for Hospital Management Information Systems (HMIS)[1]. Plethora of studies have shown the benefits of implementing HMIS[2,3,4,5,6]. The RIS is a subset of HIS which is smaller in scale. RIS equipment consists of a computer system with peripheral devices such as RIS workstations.[7] A picture archiving and communication system (PACS) is a computerised means of replacing the roles of conventional radiological film: images are acquired, stored, transmitted, and displayed digitally.[8] PACS is becoming a standard component for radiology or hospital information system [9]. The evaluation of RIS and PACS implementation has been done from various perspectives. [10] Various studies also stated that user acceptance is an essential tool before implementing PACS as it greatly determines the success rate.

Methodology

A comprehensive descriptive qualitative study was undertaken from April 2012 to December 2012. The study setting involved two tertiary care public hospitals (main hospital and an associated hospital) located at different and distant locations in the same

city with same radiologists working on rotation basis but different technicians. Both the hospitals were under the same top management control. All the consultants in the department of radiology (11) were interviewed except one who was not available during the period of study and Convenience sampling was used to select other Key Informants: Clinicians (10), Technicians (6), IT Support Team (4), PACS Engineer (1). A Structured questionnaire based on Likert Scale was used to evaluate various aspects of RIS & PACS from the end user's perspective.

Results

Following were the results of the responses received regarding the Radiology Information System (RIS):

User Satisfaction: Overall75 percent of the end users were satisfied with the performance RIS/HMIS.

Availability: About 90 percent of respondents were satisfied with the availability of RIS/HMIS online and said that the downtime of the RIS/HMIS was very less.

IT failure and Emergency Management: 45 percent of the respondents were happy with the response to IT failure and the management of contingencies via IT Department.

Data Protection and Authorization: 40 percent of the respondents were happy with the safety of the data as well as the authorisation procedures to access the data.

Clinical Document Availability: 60 percent of the respondents were satisfied with the kind of availability of the patient related clinical documents on RIS.

Legal Guidelines: 60% of the respondents were not satisfied with the kind of legal guidelines available regarding the use of RIS/HMIS. The matter of the fact was that the legal protocol was not made available to the staff and they were not oriented to these aspects as well.

Response Time: Around 65 percent of the respondents were satisfied with the response time of the workstations as well as the software programme used in RIS.

Completeness and Correctness: Around 85 percent of the respondents were satisfied with the completeness and correctness of the information made available through the RIS.

Functional Range: Majority of the users (around 60 percent) were happy with the functional range of the modalities made available through the RIS.

Redundancy: 45 percent of the respondents were not aware of the kind of redundancy available with RIS in the hospitals. The respondents (40 percent) who were aware of this fact were dissatisfied with the redundancy of the database.

Support of Interface Standards: 55 percent of the respondents were not aware of the support of the Interface Standards. Those aware of this fact (30 percent) were not satisfied with them.

Ergonomy and Uniformity: Around 45 percent of the respondents were satisfied with the kind of human-factor engineering (ergonomics) used in the Department.

Sustainability of Vendor: 50 percent of the respondents were not satisfied with the type of vendor support provided. This was true for the PACS only as rest of the RIS/HMIS was developed in-situ.

Continuity of Workflow Support: 25 percent of the respondents were happy with the kind of workflow support provided by the RIS/HMIS and PACS.

The workstation is an important component of RIS. Following responses were obtained regarding the workstations:

Overall Performance: 50 percent of the end users were satisfied with the performance of the Workstations in the Department at both the hospitals

Speed: 40 percent of the end users were satisfied with the speed of workstations in both the hospitals.

Image Quality: 65 percent of the end users were satisfied with the quality of the images made available via the PACS and 20 percent were very satisfied.

User Interface ease of use: 60 percent of the end users were very happy with the user interface provided via HMIS/RIS at both the hospitals.

Login procedure: 60 percent of the end users were satisfied with the login procedures for HMIS/RIS workstations. It is important to remember that the end users got individual passwords and the electronic trail was easy to decipher in both the hospitals.

Worklist Performance: Around 40 percent of the end users were satisfied with the kind of worklist support

and the scheduling support provided by the RIS with 25 percent being highly satisfied.

Navigation, Patient & Study Search: Around 35 percent of the end users were happy with the navigation and search support provided by the RIS/HMIS at both the hospitals.

Retrieval of previous studies: Around 45 percent of the end users were happy with the availability of the previous studies through HMIS/RIS.

Image viewing facilities: Around 65 percent of the end users were happy with the image viewing facilities made available via the RIS/HMIS and the PACS server.

Image zoom functions: Zooming of image is necessary to arrive at the findings sometimes. Around 60 percent of the end users were satisfied with such facilities.

Length and angle measurements: 60 percent of the end users were satisfied with the length and angle measurement facilities provided by the RIS/PACS.

Mirror/Rotate: 65 percent of the end users were happy with the mirror/rotate functionality made available by RIS/PACS.

Image annotation: 65 percent of the end users were satisfied with the Image annotation facility available with RIS/PACS.

Cine-mode, scroll through a series of images: 30 percent of the end users were satisfied with such functionality of the RIS/PACS.

Synchronisation of two images: Only 25 percent of the end users were satisfied with the available facilities.

Synchronisaion of a current and previous examination: 30 percent of the end users were dissatisfied with the synchronisation facility available through RIS/PACS.

Report Generation: 70 percent of the end users were happy with the report generation facility available with the RIS/HMIS.

Dictaphone: 35 percent of the end users were dissatisfied with the Dictaphone facility available with RIS/PACS. Only one consultant was using the Dictaphone services in the department.

Computer Aided Diagnosis: 60 percent of the end users were very dissatisfied with the Computer Aided Diagnosis (CAD) services available with the RIS/PACS.

The following responses were obtained regarding the reading room:

Location: 30 percent of the end users were satisfied with the location of the reading room in radiology department.

Space: 45 percent of the end users were satisfied with the space available with the reading room.

Layout: 45 percent of the end users were satisfied with the layout of the reading room.

Lighting: 40 percent of the end users were happy with the facilities for lighting up the reading room. 10 percent of the respondents were very satisfied.

Noise Level: 45 percent of the end users were satisfied with the level of noise control in the reading room.

Temperature: 50 percent of the end users were satisfied with the room temperature maintenance.

The following responses related to the Ergonomics:

General Comfort: 35 percent of the end users were dissatisfied with the general comfort levels in the reading room.

Table layout & Space: 40 percent of the end users were satisfied with the table layout and the space available.

Keyboard, mouse and other device placement

50 percent of the end users were dissatisfied with the way Keyboard, Mouse and other devices were placed on the table tops. Only 15 percent of the end users were satisfied with this arrangement.

The user's faced the following problems:

Irritation/Itching/Strain of Eyes: 20 percent of the end users did not experience any irritation, itching or strain of eyes. 10 percent of the respondents experienced irritation, itching and strain of eyes after prolonged sitting hours on workstations.

Pain in Fingers: 25 percent of the end users did not experience pain in the fingers as typing related work was very limited in the HMIS/RIS and PACS. 10 percent

of the respondents experienced pain in fingers after prolonged workstation usage.

Backache: 30 percent of the end users did not experience any backache. 10 percent of the respondents complained of the backache after working on the RIS/ HMIS and PACS workstations.

Pain in Neck: 10 percent of the end users experienced pain in the neck after prolonged use of the workstations. 30 percent of the users did not experience any such symptoms.

Other postural problems: 10 percent of the end users experienced other postural problems. 20 percent of the respondents did not experience any posture related problems. The posture related problems were correlated with the number of hours spent on the workstations as well as the age of the respondents.

The responses for workflow support were as follows:

Image reading & writing:: 40 percent of the end users were satisfied with the kind of workflow support provided by HMIS/RIS and PACS for image reading and writing.

Clinical Conference: 45 percent of the end users were unhappy with the kind of support provided for the clinical conferences. Infact, 25 percent of the respondents were very dissatisfied and remarked that HMIS/RIS and PACS seldom comes handy during clinical conferences.

Image presentation at Clinical Conference: 50 percent of the end users were disappointed with the kind of support provided for Image presentation at clinical conferences by the HMIS/RIS and PACS.

Emergency: 30 percent of the end users were dissatisfied with the workflow support for the emergency. Another 30 percent of the respondents were very dissatisfied with the available workflow support in case of casualty. Only 15 percent of the end users were satisfied with the available facilities.

Wards: 30 percent of the end users were dissatisfied with the kind of workflow support available for the wards. 35 percent of the respondents were very dissatisfied. Only 20 percent of the end users were satisfied with the workflow support available for the wards.

Outpatient Clinics: 30 percent of the end users were dissatisfied with the workflow support available for the Outpatient Clinics. 40 percent of the respondents were very dissatisfied. Only 15 percent of the respondents were satisfied with the workflow support provided by HMIS/RIS and PACS for the Out patient Clinics.

The responses to the system integration between both hospitals:

Radiology Systems of two hospitals: Only 5 percent of the respondents were satisfied with the issue of integration of HMIS/RIS at both the hospitals.

RIS with HIS of same hospital: 15 percent of the end users were dissatisfied with the integration of HMIS and RIS in main hospital as well as in associated. Another 10 percent were very dissatisfied.

RIS of one with HIS of another hospital: 45 percent of the end users were very dissatisfied with the end result of the integration of RIS of one hospital with the HMIS of another hospital.

RIS with PACS of the same hospital: 20 percent of the end users were dissatisfied with the integration of RIS with the Patient Administration System (PAS) in the same hospital be it main hospital or associated hospital .

RIS of one hospital with another hospital: 40 percent of the end users were dissatisfied with the outcome of the integration of RIS of main hospital with the associated hospital and vice-versa. Another 35 percent of the respondents were very dissatisfied with the end result of such an integration.

RIS with DIS of the same hospital: 20 percent of the end users were dissatisfied with the way in which the integration between RIS and the Diagnosis Information System (DIS) worked. Another 10 percent were very dissatisfied with the outcome of such anintegration.

RIS of one hospital with DIS of another hospital: 40 percent of the end users were very dissatisfied with the outcome of the integration of RIS of one hospital with DIS of another hospital. Another 25 percent of the respondents were dissatisfied with the end result of integration of RIS of main hospital with DIS of associated and vice-versa.

RIS with EMR of same hospital: 35 percent of the end users were dissatisfied with the outcome of integration of the RIS with Electronic Medical Records (EMR) of the same hospital be it main hospital or associated

hospital. Another 10 percent of the respondents were very dissatisfied with such an integration of RIS/HMIS and EMR.

RIS with EMR of another hospital: 45 percent of the end users were very dissatisfied with the outcome of the integration of RIS with EMR of main hospital with associated hospital and vice-versa. Another 25 percent of the respondents were dissatisfied with the outcome of such an integration.

Smart Card – Synchronization with RIS data: 75 percent of the end users were very much dissatisfied with the lack of synchronisation of smart card with the RIS.

Data Transmission – Rate of transmission between two hospitals: 15 percent of the end users were satisfied with the data transmission rates between main hospital and associated hospital. Another 5 percent were dissatisfied with the rate of data transmission between the two hospitals.

The following were the responses to data transmission aspect:

Availability of Data transmission: 15 percent of the end users were satisfied with uptime of the data availability between both the hospitals.

IT support in case of failure of data transmission: 55 percent of the end users were dissatisfied with the support provided by Department of Information Technology in the case of failure of the data transmission. Another 10 percent of the respondents were very dissatisfied with the IT support in case of failure of the data transmission.

Following were the responses to Web Interface aspect:

Availability: 60 percent of the end users were very dissatisfied with the lack of availability of Web Interface in both the hospitals. Another 20 percent of the respondents were dissatisfied with the lack of availability of web interface for online data exchange.

Delivery of Results: 65 percent of the end users were very dissatisfied with the web interface for providing delivery of the results of various investigations undertaken.

The advantages felt by the user's:

Saves time: Most of the end users (60 percent) replied in affirmative that the RIS/HMIS and PACS saves lot of time. Another 35 percent were very satisfied with the advantage of saving time.

Saves Cost: 65 percent of the end users agreed that RIS/HMIS and PACS brings cost cutting via decreasing the need of films and paper etc.

Increases Productivity: 65 percent of the end users agreed that RIS/HMIS and PACS increases productivity. Another 35 percent of the respondents were very bullish about this fact.

Storage: 60 percent of the end users replied in affirmative that storage of the data becomes easy and requires lesser space. Another 40 percent of the respondents were very satisfied with the fact that storage becomes easy as lesser number of films and paper records had to be maintained.

Decrease HR: 35 percent of the end users responded that requirement for human resources had reduced after the implementation of HMIS/RIS and PACS. Another 25 percent very strongly agreed to this fact.

Scheduling: Most of the end users agreed to the fact that HMIS/RIS help in scheduling.

Analysis: 45 percent of the end users agreed that RIS/HMIS helped in analysis of the data. Another 25 percent strongly agreed to this fact.

Resource allocation & budgeting: 50 percent of the end users agreed that RIS/HMIS helped in resource allocation and budgeting exercise. Another 15 percent of the respondents strongly agreed to this fact.

Billing/Account Receivable: 35 percent of the end users agreed that RIS/HMIS helped in billing and managing accounts receivables with 15 percent vouching strongly in its favour.

Patient Tracking: 55 percent of the end users agreed that RIS/HMIS helps in tracking the patients with additional 15 percent agreeing very strongly.

Modality & Material Management: 50 percent of the end users agreed that RIS/HMIS and PACS helps in modality and material management. Another 10 percent of the respondents agreed strongly to this fact.

Alerts: 45 percent of the end users agreed that RIS/HMIS and PACS alerts help in better patient

management. In addition, 10 percent of the respondents agreed very strongly to this advantage of HMIS/RIS and PACS.

Comparison of overall performance of RIS:

Overall performance of RIS at main hospital: Overall performance of RIS at main hospital was rated as Satisfactory by 55 percent, neutral by 35 percent and very satisfactory by another 10 percent of the respondents.

Overall performance of RIS at associated hospital: Overall performance of RIS at associated hospital was rated as Dissatisfactory by 25 percent, neutral by 70 percent and satisfactory by rest i.e., 5 percent.

Responses to miscellaneous aspects:

Patients' Compliance:

As far as the patients compliance to paperless and filmless milieu via HMIS/RIS and PACS is concerned, 35 percent of the end users were strongly dissatisfied, another 35 percent were dissatisfied and only 10 percent were satisfied with the patient compliance to filmless and paperless milieu.

Amendments: As far as amendments to the existing software programs were concerned, 50 percent of the end users were very dissatisfied with the existing scheme of things to update anything as it required a lengthy procedure and lot many permissions from higher authorities.

Cross-Referrals: 45 percent of the end users were very dissatisfied,another 20 percent of them were dissatisfied with the existing cross-referral functionality built within the RIS/HMIS and PACS.

Training: 60 percent of the end users were very dissatisfied with the training facilities for the staffin both the hospitals.

Discussion

It is essential to integrate HIS/RIS to PACS so that it combines patient's data with the respective image and the entire set of data with image makes considerable sense to the end user collectively.[10] There have been cases in the hospitals where the PACS server was down and the clinicians were not able to review any images until the server was retrieved. It led to enormous trouble to the patients and the doctors themselves.[11] Few studies report the downtime issues which were not substantiated by a very authentic and satisfactory recovery solutions.[12]

Many of the respondents were not satisfied (60%) with the kind of legal guidelines available regarding the use of RIS/HMIS. The matter of the fact was that the legal protocol was not made available to the staff and they were not oriented to these aspects as well.

Redundancy refers to the backing up or copying data on additional servers or by other electronic means as a security measure. Most of the respondents (45 percent) were not aware of the kind of redundancy available with RIS in the hospitals.

Image quality is very important aspect of the PACS. 65 percent of the end users were satisfied with the quality of the images made available via the PACS and 20 percent were very satisfied. Thus, the overall quality of images was good.Ease of use of any HMIS/RIS is very important. Around 60 percent of the end users were very happy with the user interface provided via HMIS/ RIS at both the hospitals.

Cine-mode and scroll through a series of images helps a lot in appreciation of images and arriving at the correct findings. 30 percent of the end users were satisfied with such functionality of the RIS/PACS.

Synchronisation of two images aids in radiology diagnosis. Only 25 percent of the end users were satisfied with the available facilities. Synchronisation of different examinations is also important. 30 percent of the end users were dissatisfied with the synchronisation facility available through RIS/PACS.

30 percent of the end users were satisfied with the location of the reading room in radiology department. Overall performance of RIS at main hospital was rated as Satisfactory by 55 percent, neutral by 35 percent and very satisfactory by another 10 percent of the respondents.

Overall performance of RIS at associated hospital was rated as Dissatisfactory by 25 percent, neutral by 70 percent and satisfactory by rest i.e., 5 percent.

Training of the staff is very essential component to make use of any Information Technology product. As far as training in HMIS/RIS and PACS is concerned, both the hospitals were found lacking in this crucial aspect. Around 60 percent of the end users were very dissatisfied with the training facilities for the staff.

Various studies also stated that user acceptance is an essential tool before implementing PACS as it greatly determines the success rate and also stated the importance of training or familiarization programs should be given utmost importance in order to motivate the employees ultimately increasing the productivity of the system.9

Spinal Region Segmentation for Intervertebral Distance of X-Ray Images Using Spectral Analysis

Virendra Singh[1], Vineeta Saxena Nigam[2]

[1]Research Scholar, Dept. of Electronics and Communication Engg., UIT RGPV, Bhopal, India,
[2]Professor & Head,Dept. of Electronics and Communication Engg., UIT RGPV, Bhopal, INDIA[2]

Abstract

Physics plays a vital role in cultivating the knowledge of natural sciences and establishing the foundation of logistic and scientific method. The application of physics to medical sciences has been developed in practice for centuries. X-Ray, CT scan and MRI images of the spine provide a practical approach for detecting and assessing vertebral abnormalities. For accurate vertebra detection number of features of an image can be extracted and meaningful information can be obtain from low level information in the image using segmentation. In this paper a method is proposed for making treatment of spinal traction efficient and feasible by using image processing algorithm based on the data obtained from the survey and images of the patients.

Keywords: *Spinal Traction, Hough transform, segmentation,spectral transformation and Survey report.*

Introduction

With the time, as there is advancement in medical technology, there is also a huge increment in number of physical disabilities and diseases. Among them some are curable and some aren't. Now a day's researchers are more concerned in finding the cure of major diseases like Cancer, HIV AIDs, and Diabetes etc. But still there are some common problems which needs attention like Low back pain, disk herniation, sub-acute pain etc. As work load is increasing, problem of low back pain & sub-acute pain and issues related to spinal cord are also growing simultaneously. Ignorance of such pain becomes chronic disease which not only affect our spine, but also affect our work, afterwards it become major symptoms of disabilities. Low back pain is further classified as acute or sub-acute lower backpain and chronic lower back pain. Acute back pain generally last for 2-3 weeks because of which people don't give it much attention but chronic treatment of chronic lower back pain is too difficult, that even surgery can't provide permanent relief.[1][2]

The diagnosis and treatment of lower back pain, disk herniation, and muscular spasm, etc. thus become a major problem. Lumbar and cervical disk herniation is one of the most common causes of lower back pain and it is often caused in the weakest part of the disk i.e. posterolateral side.

Lumbar and cervical traction is most preferred treatment of lumbar and cervical disk herniation but its effectiveness as a part of physical therapy is a matter of discussion.

Literature Review: Research done in clinics indicates that disc is responsible for majority of lumber and cervical pains. Compression decreases intradisc space and increases pressure between intervertebral disc leading to annular compromise and possible extrusion of nuclear material[5].

Now a day's Traction using Decompression Therapy becomes an effective method of treatment in spinal traction. In the spinal decompression therapy, spinal disc can be isolated and negative pressure is applied by cycling through distraction and relaxation phases, this causes a vacuum effect within it.

Disc disorders are often connected to spinal trauma. Trauma arises in neck due to head injuries caused during accidents and falls. As the brain stem regulates the postural muscles of the spine, any injury in the upper portion of the neck can affect brain's normal control over the postural muscles, which leads to muscular weakness, atrophy and spasm throughout the neck and back.[6] Author gives a new approach in which two diagnostic tools are used for analysis of injuries in upper cervical

region –Para spinal Digital Infrared Imaging and Upper Cervical Radiography . Magnetic Resonance Imaging is effective technique for detecting fractures, pseudo-arthrosis, and infections [7]. Three-dimensional imaging tests like MRI and CT scan, is ideal foranalyzing & visualizing pathology of the IVD (intervertebral disc), neural structures such as the spinal cord. Imaging method provide superior structural information and a better resolution[8]. Schmitz et al. [9] proposed a new method in which semiautomatic image analysis routine is used to analyze dendrite and synapse characteristics in immune-fluorescence images. Another method effective in reducing pain or improving intervertebral motions is HVLA-SM(High velocity low amplitude spinal manipulation)[10].

Objective: As X-ray image of spine are very noisy and of low contrast, the extraction of geometric features from images is very common problem. Over the years, several different approaches have been devised to extract these features. In present scenario the treatment(traction) given for spine problems is based on the experiences of physiotherapist and the ranges predefined in literature. Sometimes the treatment becomes inefficient and also cause several other adverse effect. In present scenario none of the method used for treatment combined images and physics together. The key objective of this research is to develop an algorithm for efficient traction treatment using image processing algorithm. With the help of this algorithm we will be able to calculate the exact amount of force which is required, after considering the age, weight and other factors, to fulfill the treatment of spinal traction. This will provide accuracy and efficiency in the methodology of traction treatment applied.

a. The traction therapy will be more accurate & efficient.

b. It will be economical as the number of therapies to be provided would be less thus reducing the charges to be paid multiple times.

Survey Report: To find the accuracy of traction treatment a small survey is conducted under which data of 84C-spine vertebras were collected and studied. Following observations are mention below:

For cervical traction the force to be applied is. 1/7th part of body weight and for lumbar traction the force applied i.e. 1/3rd of body weight as per defined in various literature. The following data were taken from Narmada Trauma Centre(Bhopal) and Rajiv Gandhi Hospital (Trilanga, Bhopal).

Table 1 Survey Report of Some Patients Who were Going Under The Treatment of Traction.

Patient Number (Male/Female)	Age of patient (in years)	Body Weight (in kg)	Type of traction	Applied Weight (in kg)
Patient 1 (Male)	42	65	Cervical	7
Patient 2 (Female)	40	55	Lumbar	20
Patient 3 (Male)	35	55	Cervical	6
Patient 4 (Male)	57	68	Cervical	8
Patient 5 (Female)	24	58	Cervical	6
Patient 6 (Female)	23	62	Cervical	6
Patient 7 (Male)	40	52	Cervical	6
Patient 8 (Female)	55	70	Cervical	8
Patient 9 (Female)	51	75	Lumbar	25
Patient 10 (Male)	51	90	Cervical	10
Patient 11 (Female)	560	70	Cervical	5
Patient 12 (Male)	50	75	Cervical	8
Patient 13 (Male)	23	59	Cervical + Shoulder pain	8
Patient 14 (Male)	42	60	Cervical	2
Patient 15 (Male)	55	60	Lumbar	20
Patient 16 (Male)	55	75	Lumbar	25

This data leads to us to do work for the improvement of traction treatment.

Methodology

Detection of accurate vertebra is most important for efficient spinal column diagnosis. In this paper we focus on one section of the spine i.e cervical spine. Primary objective of this research is to find intervertebral posterior height using image processing algorithms. The proposed approach is the hybrid approach in which the results obtained from image processing algorithm is combined with the physics behind the traction therapy, inorder to develop an generalized approach to calculate exact amount of force which is to be given to patient in case of cervical traction.

The intervertebral disc(IVD) is comprised of three distinct components: (a)the annulus fibrosus, (b) the nucleus pulposus, and (c)the cartilaginous endplates. The annulus fibrosus is the tissue of the intervertebral disc that surrounds the nucleus pulposus and forms the outer portion of the disc. Due to compressive load the posterior section of the intervertebral disc will undergo tension loading that causes the annulus to contract toward the center of the disc (White and Panjabi, 1990).

Table 2: Shows the intervertebral height for cervical spine

Study|	IVD Height	C23	C34	C45	C56	C67	C7T1
Gilad and Nissan, 1986	Anterior	4.8 mm	5.3 mm	5.5 mm	5.4 mm	5.2 mm	4.7 mm
	Posterior	3.4 mm	3.3 mm	3.0 mm	3.0 mm	3.3 mm	3.5 mm
Przybylski et al, 1998	Anterior	5.2 mm	5.3 mm	5.2 mm	4.6 mm	4.9 mm	
	Posterior	3.4 mm	3.4 mm	3.7 mm	3.9 mm	4.3 mm	

Due to load, the intervertebral posterior height reduces. In this research, image processing algorithm are used to detect the intervertebral posterior height. If the intervertebral space is less then 3mm, mathematical algorithm runs to calculate the amount of traction force that is to be applied on the patient under medical supervision.

The proposed method consists of the following steps that will be applied to spinal images .a. Pre-processing stage includes- image acquisition, region localization (RL) and region localization enhancement.b. Shape boundary representation and segmentation stage-include GHT(Generalized Hough transform)

Performance Measures: Statistical parameters to calculate the performance of a binary classification are Sensitivity and specificity.

Standard formulas were used to measure accuracy, sensitivity and specificity.

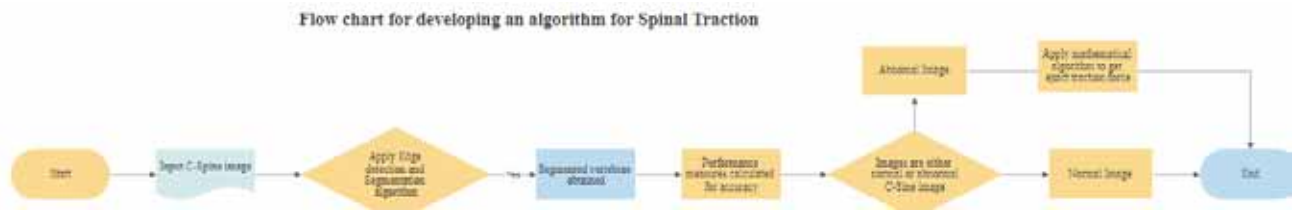
$$ACC = \frac{(TP + TN)}{(FP + TN) + (TP + FN)}$$

$$\text{Sensitivity} = \frac{TP}{(TP + FN)}$$

$$\text{Specificity} = \frac{TN}{(FP + TN)}$$

Jaccard Coefficient: The Jaccard coefficient measures similarity between finite sample sets, and is defined as the size of the intersection divided by the size of the union of the sample sets

Dice Coefficient: The Sorensen–Dice index, is a statistic used for comparing the similarity of two samples.



RESULTS

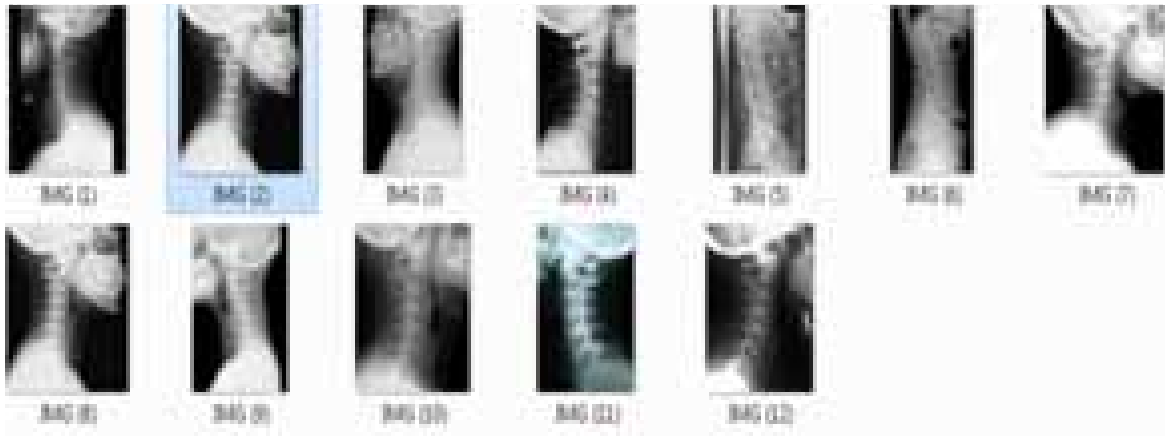


Fig. 3: Image database in Matlab

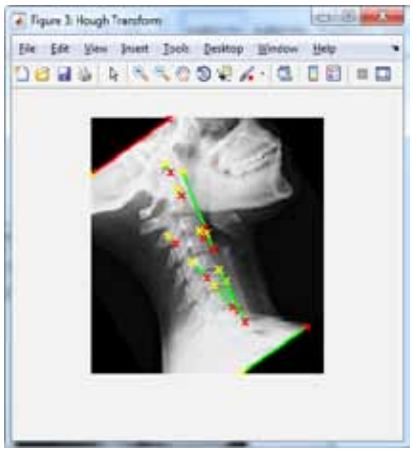
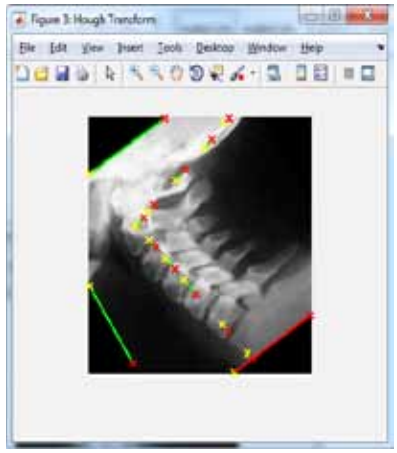
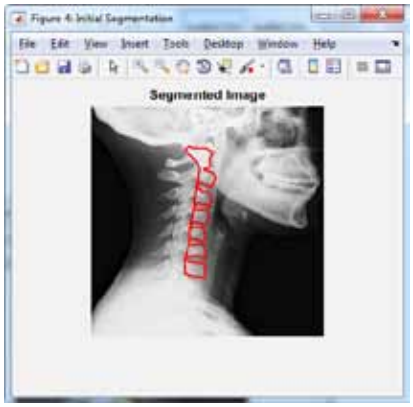
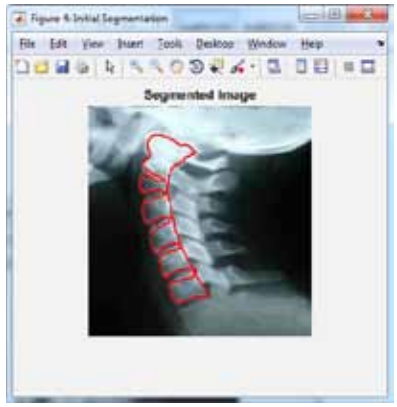
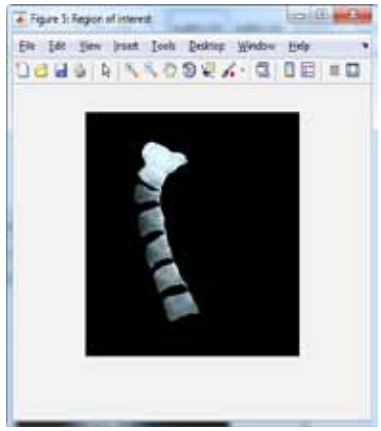
Normal image	Abnormal Image

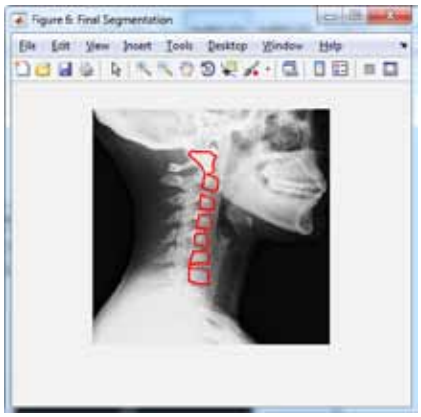
Normal image	Abnormal Image
				


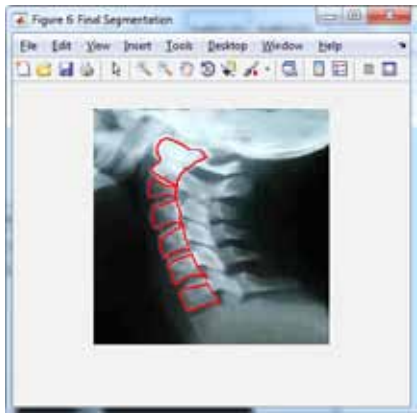












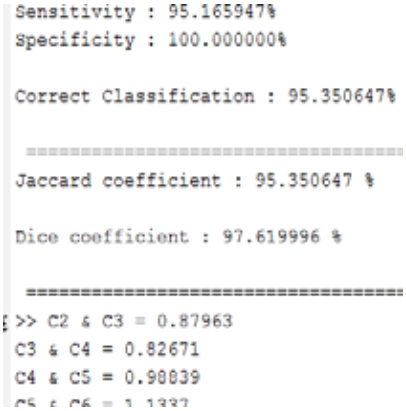
Normal image	Abnormal Image
	


Fig. 4: Results of image analysis

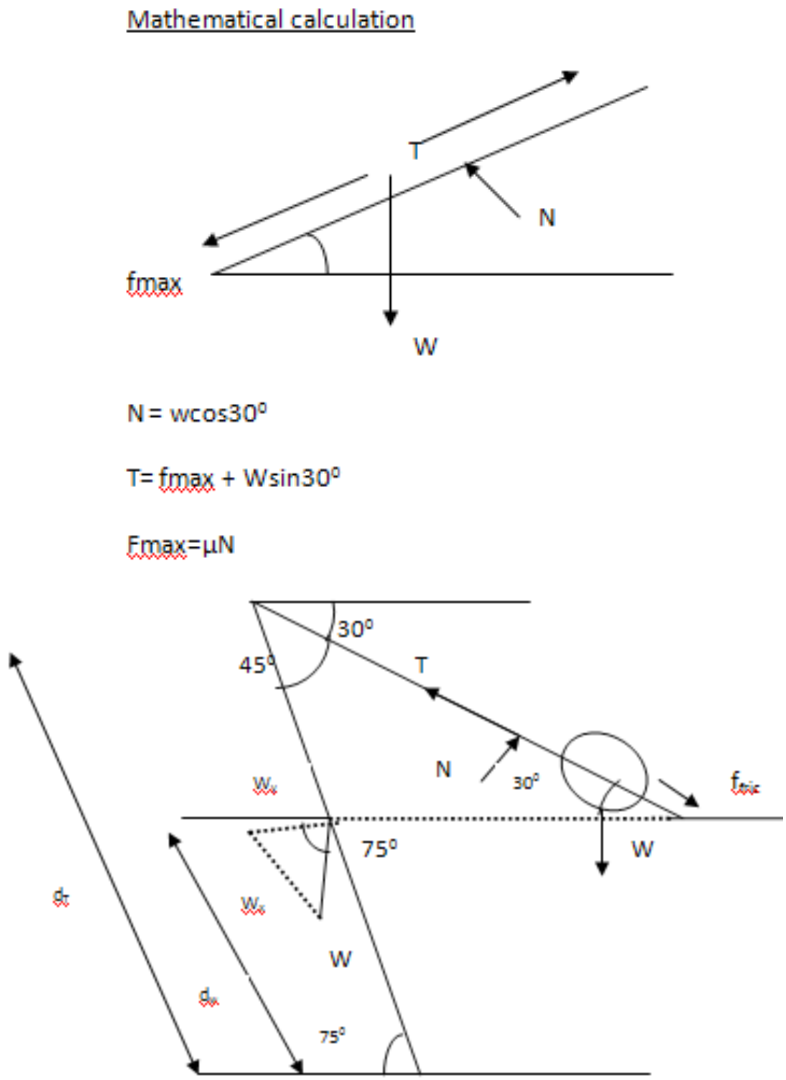
Result Analysis

Fig 4 shows that in abnormal cervical image the intervertebral posterior height calculated is less then 3mm. In such condition an algorithm is applied in order to calculate traction force which may be applied to the patient under medical supervision.



Free body diagram of traction machine setup

Below calculations are based on the traction machine setup,. i.e distance from ground, machine weight and total height.

The cervical traction is applied to a patient; traction force is developed in backward while maintaining the system in equilibrium.

Machine weight =15 kg

Center of mass height from ground= 102cm (max)

If the distance from bottom to the center of mass is 102cm, then the total height from where force is applied is 173cm as distance from bottom to the center of mass 59% of total height.

From the free body diagram establishing momentum equation about the bottom

$T_y.d_T=W_y.d_w$

Where:the distance from the bottom to the center of mass is

d_W=59% of 1.73m =1.02m and

d_T= 85% 0f 1.73m = 1.46mtherefore

$T_y.d_T=W_y.d_w$

$Tsin45^0.d_T = W_y.d_w$

$(fmax +wsin30^0)sin45^0*1.46 = Wcos75^0*1.02$

As fmax = μ.N

In this paper for two body weight of a patient calculations are done

Body weight is 70kg and 75kg, so head weight i.e 8% of the total body weight are 5.6kg and 6kgs respectively.

$(\mu.N + wsin30^0)sin45^0* 1.46 = Wcos75^0*1.02$

Where $N = Wcos30^0$,here w is weight of the head of a patient

And the value of μ = 0.2

Now equating the values in the equation

$(\mu. Wcos30^0 + wsin30^0) sin45^0x 1.46 = Wcos75^0x1.02$

$(0.2*5.6cos30^0+ 5.6sin30^0) sin45^0* 1.46 = Wcos75^0*1.02$

The exact W i.e traction weight can be calculated as

$$W = \frac{[(0.2*5.6cos30^0+ 5.6sin30^0) sin45^0* 1.46]}{cos75^0*1.02}$$

W= 14.7kgs

Accuracy recognition comparison between the study of Gilad & Nissan, 1986, Przybylski et al,1998 and Present Research.

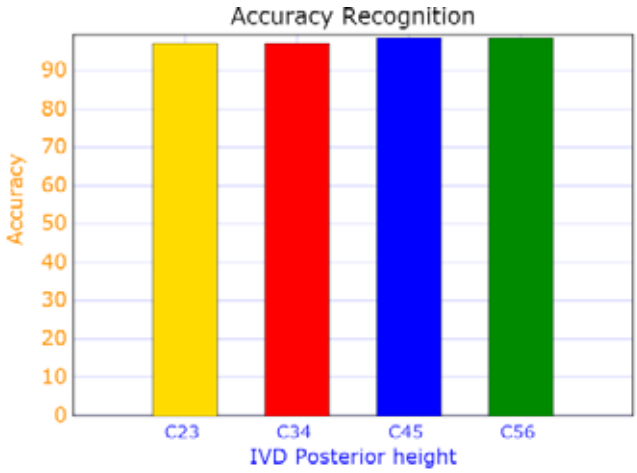


Fig 5: Accuracy Recognition Chart

Discussion

As discussed earlier, the current methodology of applying traction is not the accurate method as not all the parameters are considered while applying force on the body. This method at present is just based on hit and trial which can be done by the experienced physiotherapists only, as there is a huge probability of error if practiced by any inexperienced doctor. The machines that are used to apply weight during the therapy simply apply force, fed to them as an input by the therapist, which is calculated on the basis of body weight, age and sex of the patient. Hence this therapy need some changes for improvement, in medical practice to improve decision-making by matching a treatment to a specific sub-group of patients Clinical prediction rules (CPR) are commonly used [11]. To make it more efficient and accurate method for experienced as well as inexperienced physiotherapists to study. The force applying machines should work automatically on the basis of the patient's physical status and not much interference, in calculation, of the therapists should be involved. A user-friendly

interface will be also built for usability improvement and enhancement[12].

Conclusion

On the basis of this algorithm machines can also be designed which can apply calculated force automatically. Thus reducing manual work and reduction in manual interference will lead to lesser error in the traction process.

Future Scope: A Clinical prediction has been developed which will improve decision-making and reduce time & cost[11]. Considering the advantages (feasible, accurate and economic) of the goal, if achieved, this may be used to develop traction machines in future which will be algorithm based and would work automatically on the basis of the factors to be considered while applying the therapy. This will also reduce the duration and frequency of treatment to be applied to a patient.

Ethical Clearance: Dataset have been collected from hospital, no involvement of human subject is done in research. LOR is received from Rajiv Gandhi Physiotherapy College, Bhopal

India, [3]Nursing Tutor, Department of Mental Health Nursing, Shree Guru Gobind Singh Tricentenary University, Gurugram, Haryana, India

Abstract

Background: India has witnessed a substantial growth in the consumption of plastics and an increased production of plastic waste. Polyolefin account for the major share of 60% in the total plastics consumption in India. Plastic causes major health problems.

Aims and Objectives:

1. To assess the knowledge regarding plastic use and its health effects among nursing students.
2. To assess the attitude regarding plastic use and its health effects among nursing students.
3. To determine the relationship between knowledge and attitude regarding plastic use and its health effects among nursing students.
4. To find out the association of knowledge and attitude regarding plastic use and its health effects among nursing students with selected variables.

Material and Method: The research approach adopted for the study was quantitative research approach and design was descriptive research design. The study was conducted at selected colleges of Ambala, Haryana. A total of 300 students were selected by using convenience sampling technique. The tool used for the data collection consisted of selected variables, structured knowledge questionnaire and structured attitude scale to measure knowledge of students.

Results: Study results revealed that mean score of knowledge was i.e. 59% than mean score of attitude was i.e. 80.3%in the study. A mild positive correlation (r=0.07) was found between knowledge and attitude. There was a significant association of knowledge with gender (p=0.03), academic qualification (p=0.01) and types of school (p= (0.03). There was a significant association of attitude with religion (p=0.00), year (0.00), residence (0.00) and previous knowledge (0.01).

Conclusion: Study concluded that the students have average knowledge and moderately favorable attitude regarding plastic use and its health effects.

Introduction

"If you are kind so show your kindness towards reducing plastic" *–Smarthermione Grang*

Plastic industry is one among the quickly developing enterprises in the India. In India, 70 percent of absolute

plastic utilization is disposed of as waste. Around 5.6 million tons for each annum (TPA) of plastic waste is produced in nation, which is around 15,342 tons for every day. The development rate is relied upon to be 10% throughout the following five years.[1]

In Haryana the assessed plastic waste age in the State is around 23369.09 tons/annum.[2]

The utilization of plastic convey packs has been mostly prohibited in some pioneer age focuses, visitor and recorded spots situated in Andhra Pradesh, Arunachal Pradesh, Goa, Gujarat, Karnataka, Odessa, Tamil Nadu, West Bengal, Uttar Pradesh and Uttarakhand.[3]

The purposes behind fame for utilizing the plastic sacks are that these are light weight, protection from corruption (synthetic concoctions, daylight and microscopic organisms), sturdiness or more all ease. After their entrance to condition, plastics take somewhere in the range of 15 to 1000 years to biodegrade. It stances hazard to human wellbeing, creatures and marine life.[4]

Utilization of Plastic is influencing human wellbeing. Harmful synthetic concoctions filter out of plastic and are found in blood and tissue of us all. Presentation to them is connected to the malignant growths, birth deserts, impeded insusceptibility, endocrine interruption and different issues. Because of the utilization of compound added substances during plastic creation, plastics have possibly hurtful consequences for human's life that could demonstrate to be cancer-causing or can prompt endocrine interruption.[5]

If a ban is placed on the employment of plastics on emotional grounds, the $64000 value would be abundant higher, the inconvenience far more, possibilities of injury or contamination abundant bigger. The risk to the family health and safety would be increase and particularly of the environmental burden would be manifold..[6]

Plastic has several dangerous effects on health and students are pillars of a demographic nation. Nurses can play a main role in educating the community they ought to have correct data concerning health effects of plastic.[7]

Objectives:

1. To assess the knowledge regarding plastic use and its health effects among nursing students.
2. To assess the attitude regarding plastic use and its health effects among nursing students.
3. To determine the relationship between knowledge and attitude regarding plastic use and its health effects among nursing students.
4. To find out the association of knowledge and attitude regarding plastic use and its health effects among nursing students with selected variables.

Methodology

The study was conducted during the month of February-march 2019 at selected nursing colleges of Ambala, Haryana India. A sample of 300 nursing students participated in this study with the prior permission. The ***ethical clearance*** was obtained fromthe Principles of the respective colleges**.** A written consent was obtained from the participants who were enrolled in the study. Quantitative research approach with Non Experimental Descriptive survey designwas used in this study. The study includes the regular B.Sc Nursing students who were willing to take part in the study, A total of 300 participants were enrolled for the study by using convenience sampling technique. Data was collected by using selected variables, Structured Knowledge questionnaire and Structured Attitude Scale. The technique used was Self report (paper and pencil)

Description of data collection tools

Section I: Development and description of selected variables: It consist of 11 items such as age in year, gender, religion, year of study, academic qualification, type of school, area of living, residence, total family income, monthly pocket money, previous knowledge and if yes, then specify

Section II: Development of Structured knowledge questionnaire to assess knowledge of nursing students: A structured questionnaire was developed to assess the knowledge of Nursing Student regarding plastic use and its health effects. It consist of 30 multiple choice questions related to concept,types, use, hazards and management of plastic

Section III: Development of Structured attitude scale to assess attitude of primary school teachers: Structured attitude scale (5- point Likert scale) consisted of 30 items on attitude. It was prepared to assess the attitude of nursing students. Interpretation of attitude scores was strongly agree, agree, undecided, disagree and strongly disagree

Procedure: The permission was taken to conduct the study from the Respective Principles of selected nursing colleges of Ambala, Haryana. The Consent was taken from the participants prior to the study. The selected variables, Structured Knowledge Questionnaire and Structured Attitude Scale Questionnaire were administered to students. The participants were assured about their confidentiality of their response. Purpose of the study was explained to sample subjects before data collection. It was found that it took 20 minutes to complete the questionnaire. The items were found clear and understandable.

Results

Section-I: Frequency and percentage distribution in terms of level of knowledge and attitude of mothers regarding oral hygiene of under five children as given in table 1 and table 2.

Table 1: Frequency and percentage Distribution in terms of level of knowledge regarding plastic use and its health effects among nursing students. N=300

Level of Knowledge	Scores	Frequency	Percentage
Very Good	26-30	3	1
Good	20-25	47	15.67
Average	14-19	177	59
Poor	7-13	64	21.33
Very Poor	<6	9	3

The data presented on table 1 shows that majority of students (59%) had average knowledge regarding plastic use and its health effects and only 1% students had very good knowledge.

Table 2: Frequency and percentage Distribution in terms of levels of attitude regarding plastic use and its health effects among nursing students. N=300

Level of attitude	Scores	Frequency	Percentage
Highly favorable	121-150	13	4.4
Moderately favorable	91-120	241	80.3
Unfavorable	30-90	46	15.3

Maximum Score- 150 Minimum Score-30

The data presented in table 2 shows that majority of students (80.3%) have moderately favorable attitude. The data further shows that only 4.4% of students had highly favorable attitude regarding plastic use and its health effects.

Section-II: Range, Mean, median and standard deviation of knowledge and attitude scores regarding plastic use and its health effects among nursing students.

Table 3: Mean Median, Range and Standard Deviation of knowledge scores regarding plastic use and its health effects among nursing students N=300

Variable	Range	Mean ±SD	Median
Knowledge	26	15.93 ±4.24	16
Attitude	78	101.27±11.39	102

The data presented in table 3 shows that the mean± standard deviation of knowledge score regarding plastic use and its health effects among nursing students is 15.93±4.24 and median is 16 and the mean± standard deviation of attitude scores regarding plastic use and its health effects among nursing students is 101.27±11.39 and median is 102.

Section III: Coefficient of correlation between the knowledge and attitude scores regarding plastic use and its health effects.

Table-4: Correlation between knowledge scores and attitude scores regarding plastic use and its health effects among nursing students.

Group	Mean±SD	r (p value)
Knowledge	15.93±4.2456	0.07 (0.02)*
Attitude	101.27±11.39	0.07 (0.02)*

The table 4 shows that there is a mild positive correlation (0.07) between knowledge and attitude with p value 0.02 which shows that there is a significant relationship between knowledge and attitude scores regarding plastic use and its health effects among nursing students.

Section-IV Association between the level of knowledge and attitude regarding plastic use and its health effects among nursing students with the selected variables shows that there is significant association of knowledge with gender (0.03), academic qualification (0.01) and type of school (0.03) at 0.05 level of significance. Further it shows that there is significant association of attitude with religion (0.00), year of study (0.002), residence (0.004) and monthly pocket money (0.03) at 0.05 level of significance.

Discussion

The present study was conducted to assess the knowledge and attitude regarding regarding plastic use and its health effects among nursing students.

The present study finding indicate that more than half students (59%) have average knowledge which is contradicted to the findings of the study done by N. Srinivasam and et al.[40] which indicated that less than half students (48%) have average knowledge.

The present study findings indicated that majority of students (80.3%) had moderately favourable which is similar to the findings of the study done by Ali haider and et al[49] which indicate that majority of the students (85%) had moderately favourable attitude.

The present study findings indicated that maximum number of students (37%) belongs from age group of 18 year which is similar to the findings of the study done by Mr. Paralhad V Iddalagi[43] which indicated that maximum number of students (47%) belongs to age group of 18 year.

The present study indicated that majority of students (86.7%) were having academic qualification of senior secondary which is not contradicted to the findings of the study done by Nitin joseph[46] and et al. which indicated that majority of the students (89%). were having academic qualification is graduation

Conclusion

Majority of nursing students had average knowledge regarding plastic use and its health effects. i.e., 59%. Majority of nursing students had moderately favorable attitude regarding plastic use and its health effects. i.e., 80.3%. A mild positive correlation was found between knowledge and attitude i.e., r=0.07. There was significant association between the knowledge and attitude score with selected variables

Conflict of Interest: Nil

Financing Sources: Nil

Ethical Clearance: The permission was obtained from the principles of the respective colleges and written consent from the nursing students.

Socio-Demographic Profile of Suicidal Cases Autopsied at Tertiary Care Centre in Uttarakhand: A Retrospective Study

Vikas Vaibhav[1], Pawan Kumar Shukla[2], Sanchit Jain[1], Raviprakash Meshram[4]

[1]Junior Resident, Department of Forensic Medicine and Toxicology, All India Institute of Medical Sciences, Rishikesh, Uttarakhand, [2]Senior Resident, Department of Forensic Medicine and Toxicology, All India Institute of Medical Sciences, Raipur, Chhattisgarh, [4]Associate Professor, Department of Forensic Medicine and Toxicology, All India Institute of Medical Sciences, Rishikesh, Uttarakhand

Abstract

Suicide is an imperative public health problem that needs social as well as medical attention. In India, 134516 people committed suicide in 2018 and also there is an increase in the number of suicide cases in Uttarakhand as well. The aim was to analyse the trend of suicidal deaths autopsied at our center concerning different parameters like age, gender, method of suicide, reason for suicide, to know the demographic pattern and its cause. The autopsy reports and inquest papers of suicidal cases autopsied at AIIMS Rishikesh were included for evaluation. Out of total 19.49% of total autopsies were of suicidal deaths. Majority of the victims were males (76.42%) compared to females (22.76%). The average age of victims was 35 years and 76.4% belonged to the age group 14 to 43 years. The risk of suicide was more prevalent in urban population. Among the total victims, 39.83% were in jobs. Regarding the reason behind suicide, family dispute was most common. The most common mode of suicide was hanging followed by poisoning and drowning. Organophosphates was the most repeated poison consumed in suicides by poisoning. About 75% cases were complete suicides and couldn't receive medical care. Majority of the cases belonged to Rishikesh police station. The important aspects of suicides among young generation is peer pressure which can be from family, institutional, or work etc. An effective strategy needs to be devised to combat the issue.

Keywords: *Suicides; Autopsy; Hanging; Poisoning; Family disputes; Depression.*

Introduction

Suicide is an imperative public health problem that needs social as well as medical attention. Suicide not only causes loss of an individual's life but also mental trauma to the family of deceased. It is estimated that suicide is among the top twenty leading causes of death worldwide.(1) Around 8,00,000 people die every year from suicide, which is one person every 40 seconds.(1) In our society, mental health issues are often stigmatized, people hesitate to accept their mental health problems. There are also legal issues associated with suicide many cases go unreported which is one of the major causes for under-reporting of number of suicides. An increase in suicides in third world countries as compared to developed world is due to prevalence of higher degree of socioeconomic and behavioral risk factors for suicide.(2)Many demographic parameters like age, sex, occupation, and method of suicide may vary between different regions, societies, etc.(3)

In India, 134516 people committed suicide in 2018.(4) The rate of suicide has increased from 9.9 of 2017 to 10.2 in 2018.(4) In 2018,the majority of suicide cases were reported from Maharashtra (17972), Tamil Nadu (13896), West Bengal (13255), Madhya Pradesh (11775), and Karnataka (11561). These five states accounted for 50.5% of total suicide cases in the country.(4) The total number of cases reported from Uttarakhand was 421 in 2018 which is 27.2% higher than the previous year.(4)

After the mortuary of All India Institute of Medical Sciences (AIIMS) Rishikesh became functional, we noticed an appreciable frequency of suicidal cases being brought for autopsy. The profiles of victims and method of suicides adopted by them were varying. There was an increasing number of cases from a particular area. The following observations were the reasons behind this study. The aim was to analyse the trend of suicidal deaths autopsied at our center concerning different parameters like age, gender, method of suicide, reason for suicide, to know the demographic pattern and its cause.

Methodology

A retrospective study was conducted from October 2018 to June 2020 in the department of Forensic Medicine & Toxicology at AIIMS Rishikesh. The autopsy reports and inquest papers of suicidal cases were included for evaluation. AIIMS Rishikesh covers autopsy cases from seven police stations distributed in 3 districts of Uttarakhand. The following parameters were included for evaluation age, gender, occupation, area of residence,place of death,method of suicide, type of poison ingested in poisoning deaths, and police station to which the case belonged.

Results

A total of **631** cases were autopsied during the study period, out of which **123** cases (**19.49%**) were of suicidal deaths. Males were predominant 76.42% (n = 94) than females 22.76% (n = 28) with male: female ratio of 3.3:1. The average age of victims was 35 years and 29.2% belonged to the age group 24 to 33 years*(Figure 1)*. The risk of suicide was more prevalent in urban population (n=81, 65.85%) compared to rural population (n=42, 34.14%). Among the victims, 39.83% (n = 49) were in jobs, 37.39% (n = 46) were jobless including housewives, 19.51% (n = 24) were students, 3.25% (n = 4) were retired persons *(Figure 2)*. Regarding reason for suicide, family dispute was most common (n=48, 39.02%) followed by depression (n=33, 26.82), love affair (n=11, 8.94%), and mentally challenged (n=4, 3.25%). The reason was unknown in 21.13% (n=26) cases*(Figure 3)*. The most common mode of suicide was hanging (n=61, 49.59%), followed by poisoning (n=46, 37.39%) and drowning (n=9, 7.31%). In suicides by poisoning, the most common poison ingested was organophosphates (n=20, 43.47%) followed by phosphorous compounds (n=6, 13.04%), toilet cleaner (n=2, 4.34%), THC + Opioid + Morphine + Benzodiazepine (n=1, 2.17%) and the nature of poison was unknown in 34.78% (n=16) cases. Most cases (74.79%, n=92) did not receive any medical facility before death whereas only 25.20% (n=31) cases were brought to hospital but did not survived. AIIMS Rishikesh has jurisdiction of 7 police stations for medico-legal autopsy. These police stations are Rishikesh, Raiwala, Muni kireti, Laxman jhula, Narendra nagar, Ranipokhri and GRP Dehradun. Most autopsies were done under Rishikesh jurisdicted (n=85, 69.10%) including hospital admitted deaths, followed by raiwala (n=13, 10.56), muni kireti (n=11, 8.94%), laxmanjhula (n=7, 5.69%), narendranagar (n=2, 1.62%), ranipokhri (n=4, 3.25%), and GRP Dehradun (n=1, 0.81%).

Discussion

The present study demonstrates the sociodemographic profile of complete suicide cases brought for autopsy at our center. Suicidality represents a major healthcare problem particularly in low and middle-income countries.[5]As a developing nation, India is also struggling with the same issue and efforts are being made to combat. The study showed men were more vulnerable to suicide compared to women (76.42% v/s 22.76%) with a ratio between the two was 3.3:1. A study by Nunez et. al. found similar results with 86% men of the total victims and the ratio between men: women were 6:1 [6] Suicidal attempts were higher in females but the rate of complete suicide was comparatively higher in males.[9] Conversely, suicide was more common among males but suicidal behavior was more common among females.[7] A similar retrospective study done in Kuwait from the year 2014-2018, included 297 cases and showed that 81.1% were males and surprisingly of all cases 60.2% were Indians and only 7.4% were Kuwaitis.[8]

The average age of victims committing suicide by any method was 35 years and the most susceptible age group was 14-33yrs. Many evidencesare available which suggests that the young individuals in their 2nd to

3rd decade of life were the major contributors to overall suicidal deaths.[5] Nunez-Samudio V et. al. found 20-29 years as the most affected age group.[6]A systematic review showed an overallhigh prevalence of suicide rates in the 20-29 years age group but females were predominant in committing suicides for age-group under 30 years whereas males were leading for age group 30 years or older.[13] Regarding the area of population more vulnerable to suicides, urban population reported more deaths compared to rural. The possible reason could be the stress at workplace, busy life style, high cost of living etc.

India's contribution to the global suicide rate has increased from 25.3% in 1990 to 36.6% in 2016 among women and from 18.7% to 24.3% among men.[10]In a study conducted among different states of India, suicide rates per one lakh population increased from 14.9 in 2001 and 15.4 in 2016. It was also observed that developed states reported higher suicide rates as compared to less developed ones.[11] India is ranked 19th among the world in the context of suicides.[12] One of the sorrowful aspects of suicides in India is farmer suicide, it is mainly linked to marginal return from farmland, lack of income streams, indebtedness, crop failure due to factors like rain, loss of social status, and failure to fulfill social role compels a person to commit suicide.[12]

The present study found family disputes and depression were the most common cause of committing suicides. A similar study showed 33.7% of people commit suicide for personal reasons and 24.4% for unknown reasons, in which no specific cause was found.[11] A strong association was observed between suicide, comorbid physical or psychiatric ailments and substance abuse,especially alcohol.[12] Suicides are mostly related to psychiatric problems like depression, as demonstrated in another study.[5]Among the low socio-economic states of the country, mental illness, alcohol abuse and interpersonal difficulties were the major problems.[13] The most preferred method of suicide by any gender in our study was hanging (49.59%) followed by poisoning (37.39%). The method of suicide preferred by males was also hanging followed by poisoning and drowning. Comparatively among females, the method of choice was poisoning followed by hanging. Many studies found similar results of hanging as the most common method of suicide followed by self-poisoning and use of firearms.[5] The use of firearms is more prevalent in the western world due to ease in issuing of licensed weapons as compared to our country where it is difficult to obtain the license, however the incidences of firearm suicides are not uncommon among armed forces. Contrary to our findings Dandona R et. al. found poisoning as the leading method of suicide followed by hanging.[11] Similarly, Rane A et al. found hanging as a leading method followed by poisoning. Self-Immolation was also common among women as seen in dowry deaths. [13,17]Hanging requires any household material which can be used as a ligature, mostly committed when alone.

The type of poison most commonly consume was organophosphates in 43.47% autopsied cases. The type of poison was unknown in 34.78% of cases. Several studies also found pesticides as a leading cause of poisoning especially organophosphate compounds. [5,11-15] Easy availability at home and easy access to household poison isa possible cause of suicides due to poisoning. The green revolution averted the deaths from famine but also introduced pesticides such as Parathion and Endrin's to poor rural people who were not trained and equipped to use and store it.

In the present study, most victims of suicide were in the job (39.83%), followed by jobless (21.13%), students(19.51%) and housewives(16.26%). A stressful environment at work may be the possible risk factor for suicidal thoughts.[18]Ina study conducted by Lim AY et.al. In Korea, it was seen that out of 124 participants, 39.5% and 15.3% presented with clinical levels of depression and suicidal ideation respectively.[19] Another cross-sectional study conducted by Ahn SH et. al. showed that in woman workers, suicidal ideation/attempt significantly correlated with the physical environment, lack of reward, and occupational climate. But in cases of men workers, depression rather than job stress correlated with experiences of suicidal ideation/attempt.[20] Among medical residents, burnout is a common phenomenon due to overburden of work.[21] The study also showed that 64.05% of interns, 40% of junior residents show burnout thoughts. Surgical specialty residents are more prone to burnout phenomenon. No gender difference was observed in burnout.[21]

One of the important aspects of suicides among young generation is peer pressure. Internet and social media is an easily accessible platform to communicate stress but unfortunately, different method of suicides are also not difficult to find.[15,16] A relationship was observed between internet use and self- harm behavior particularly associated with internet addiction; which is very common in vulnerable age groups of our study.[16]

The suicidal death rate in India is higher than expected for its socio-demographic index level, especially for women; with substantial variations in the magnitude and man to woman ratio between the states.[10]The government should develop suicide prevention programs considering these variations among different states and strata of society to address the specific issues leading to suicides.

Conclusion

The rate of suicides is increasing at an alarming pace in our region. The young aged male individuals contribute to the major proportion of total suicides. Though urbanization is essential for economic growth, it is also posing risk of suicides in young individuals because of increasing stress to meet the survival needs. Individuals in jobs are committing more suicides than jobless which indirectly represent the stressful environment they are working in. Persons with suicidal thoughts or under psychiatric medication or depression must not be left alone because majority of the victims committed suicides when left alone. Even minor psychiatric issues should not be ignored and proper consultation needs to be taken. Norms should be set by the government over selling of agricultural insecticides as it is very easy to purchase such poisons. Gender equality could significantly reduce the number of suicides in females.

Ethical Clearance: Approval has been taken from instututional ethical committee of AIIMS-Rishkesh.

Abstract

Rheumatoid arthritis (RA) is a chronic systemic inflammatory disease with an unknown etiology, which effects on many tissues and organs. Therefore, the present study aimed to demonstrate the role of the rheumatoid arthritis in causing oxidative stress by studying the level of balance between Malondialdehyde MDA (as an indicator of oxidation) and non-enzymatic and enzymatic antioxidants in the blood serum of 95 patients of both sexes, whose ages ranged between (18-74) years, as well as 50 healthy people of both sexes and of the same ages of the injured, it was considered as a control group. The results showed a significant increase ($P \leq 0.05$) in the concentration of MDA in the serum of patients at 362% compared with the healthy control group. While the results showed a significant decrease in the concentration of non-enzymatic antioxidants represented by glutathione GSH, albumin and uric acid in serum at 48%, 17% and 6% respectively, compared with control. The results also showed a significant decrease in the activity of the enzymatic antioxidants represented by superoxide dismutase SOD and ceruloplasmin in the serum at 63% and 10% respectively, while the activity of glutathione peroxidase GPX showed a significant increase by 44% compared with control. The results of the current study showed an increase in the rising or falling of these studied variables more in female serum than males with RA. We conclude from this study a misalign of balance system between oxidants and non- enzymatic and enzymatic antioxidants, which indicates that RA disease caused oxidative stress in these patients, which leads to the long- term deterioration of the patient's condition.

Keywords: *Rheumatoid arthritis, Antioxidants, Malondialdehyde, Glutathione Peroxidase.*

Introduction

Rheumatiod arthritis (RA) is a chronic idiopathic systemic inflammatory disease, that causes cartilage damage bone ulcers and joint destruction in severe cases and often loss of function a lity. RA affects about 1% of the world's population and affects females more than males in a ratio of 1:3, this disease can begin at any age, but it often occurs in the age groups of (30-35) years, but this does not prevent it occures in children and elderly. RA affects Juveniles under the age of 16 and is called Jurenile Rheumatoid Arthritis (JRA)[(1)]. Oxidative stress is defined as an imbalance between free radicals produced by many cellular biological processes and the defensive susceptibility to antioxidants in the body, and is accompanied by an increase in lipid peroxidation, which results in subversive damage to different body tissues[(2)]. Ighodaro and Akinloye[(3)] indicates that the imbalance between free radicals and the antioxidants in the cells leads to a rise in the free radicals cuff at the expense of the antiosidents cuff in those cells, to the degree that exceeds the resistance of the body, and consequently, it produces free radicals such as Reactive Nitrogen Species (RNS) and Reactive Oxygen Species, (ROS) leading to disruptive damage to different tissues in the body, which leads to organ damage, loss of biological functions, and occurrence of various diseases, including RA, various types of cancer, cardiovascular disease[(4)].

Exposure to free radicals from a variety of sources of living organisms leads to development of a series of defensive mechanics represented in the effectiveness of

antioxidants that continuosly resist the harmful effects of free radicals formed in the body, as the body generates or provides defensive systems called antioxidants[5], which are produced internally or supplied from external sources,So the need for antioxidants has become greater than the increase in the production of free radicals due to the contestant exposure to pollutants,toxic substances, medicines and diseases that increase oxidative stress [6].

The present study aimed to know the level of oxidative stress caused by RA disease in patients of both sexes by studying the level of MDA which represents one of the final products of lipid peroxidation and some of non-enzymatic and enzymatic antioxidants in serum.

Materials and Method

Sample Collection: The current study included 95 patients with RA of both sexes (23 Males and 72 females), whose ages ranged between(18-74), who visited the Arthritis Division at Salam Teaching Hospital and outpatient clinics in the city of Mosul, after the disease was diagnosed by specialist doctors through a set of tests described by the American Society of Arthritis[7], as well as 50 healthy people of both sexes with same ages of the patients and it was considered as a control group.

Measuring Biochemical Parameters: The biochemical parameters were measured in serum as follows:

1. Serum of lipid peroxidation (Malondialdehyde MDA) concentration (as oxidant marker) by thiobarbituric acid (TBA) modified method [11]
2. Serum of glutathione (GSH) concentration modified Ellman's reagent method [12]
3. Serum of albumin concentration by bromacresol green method [13]
4. Serum of uric acid concentration by urease enzymatic method [14]
5. Serum of Superoxide dismutase (SOD) activity was measured by modified photochemical Nitro Blue Tetrazolum(NBT) method[15]
6. Serum of glutathione peroxidase (GPx) activity was measured by colorimetric method[16]

Serum of ceruloplasmin activity was measured by spectrophotometric modified method[17]

Statistical Analysis of the results was carried out with Duncan's test

Results and Discussion

1. **Malondialdehyde (MDA) Concentration (As oxidative indicator):** Table(1) showed a significant increase (P≤0.05) in the concentration of MDA in the serum of patients with RA by 362% compared with the healthy Control group, and the results of table (2) showed a significant increase in the conc. of MDA in the serum of females patients at 367% more than conc. in the serum of male patients at 339% compared with healthy. The results of this study are consistent with previous studies, as they indicated high MDA conc. in serum of patients with RA[15].

   Several authors suggested that increased reactive oxygen species(ROS) levels in RA may in a pro-oxidation environment, which in turn could result in increased MDA conc. As a result, lipid peroxidation may have a role in the pathogeneses of patients with RA[16].

2. **Non-Enzymatic Antíoxidants Concentration**

2.1 Glutathione (GSH)Concentration (As an indicator of oxidative stress): Table (1) showed a Significant decrease (P≤ 0.05) in the concentration of GSH in the serum of patients with RA by 48% compared with the control. The results of table(2) also showed a significant decrease in the conc. of GSH in the serum of male and female patients with RA by 49% and 47% respectively compared to GSH conc. in the serum of healthy. The results of this study are in agreement with the findings of each of[17].

The reason for the decrease in GSH conc. is due to the increased consumption of GSH as a non - enzymatic antioxidant(endogenous) in removing free radicals and preventing oxidation, as it transforms from the active reduced from GSH to the inactive oxidized from GSSG, GSH has a major role in protecting cells from free radicals damage, and in general that the result of infection with some diseases will lead to a decrease in GSHconc. due to the production of free radicals, which leads to its consumption as an antioxidant. GSH is an indicator of increased oxidative stress[18] .

Table (1): The comparison of serum malondialdhyde (MDA), some non-enzymatic and enzymatic antioxidants between RA patients and healthy control group for both sexes

Studied groups / Parameters	Healthy control (n = 50)			Patients (n = 95)		
	Mean±SD*	%	%	Mean±SD*	%	%
MDA conc. (µ mol/L)	1.200±0.043b	100	-	5.543±0.388a	462	362+
GSH conc. (µ mol/L)	4.955±0.198a	100	-	2.560±0.155b	52	48-
Albmin conc. (g/dl)	4.348±0.129a	100	-	3.595±0.109b	83	17-
Uric Acid conc. (mg/dl)	4.998±0.343a	100	-	4.786±0.297b	96	4-
SOD activity (ΔO.D)	0.0917±0.047a	100	-	0.0343±0.003b	37	63-
GPx activity (µ mol/L)	3.829±0.224b	100	-	5.512±0.390a	144	44+
Ceruloplasmin activity (µ mol/L)	209.03±1.767a	100	-	187.56±1.260a	90	10-

*The numbers are followed by different letters horizontally indicate a significant difference at the level of probability (P ≤ 0. 05) and correct reverse according Duncan's test.
The sign (+) are means an increase.
The sign (-) are mean an decrease.

2.2 Albumin Concentration: Table (1) showed a significant decrease (P≤ 0.05) in the conc. of albumin in the serum of patients with RA by 17% compared with the healthy group. The results in Table (2) showed a significant decrease in the conc. of albumin in the serum of females with RA by 22% higher than that of males, as the ratio of decrease in the serum of males at 14%compared with the control. The results of the current study are consistent with the findings of previous studies[19]. The reason for the low albumin conc. is due to its effectiveness as a non-enzymatic antioxidant(endogenous), which contains sulfahydret (SH-) groups, which are associated with free radicals and nullify their effectiveness. Also, albumin is associated with unsaturated fatty acids found in low density lipoproteins (LDL), and it protects them from the oxidation process, which is why researchers called the albumin sacrifical antioxidant[20].

2.3 Uric acid concentration: Table(1) showed a slightly significant decrease (P ≤ 0.05) in the uric acid conc. in the serum of patients with RA by 4%, and the results in table (2)also showed a nonsignificant decrease in the uric acid conc. in the serum of males with RA by 6% while in females by 2% compared with the control. The results of this current study correspond to the findings of[20,21]. The reason for the low conc. of uric acid is due to the fact that it represents a natural scavenger of proxynitrite radical. Uric acid is a non-enzymatic antioxidant,

Table 2: The comparison of serum malondialdhyde (MDA), some non-enzymatic and enzymatic antioxidants between both male and female RA patients and male and female healthy control group.

as it plays an important role in protecting cells from ROS resulting from certain diseases, which leads to its consumption as an antioxidant, it is an indicator of increased oxidative stress[20].

However, GSH, albumin and uric acid conc. in serum were significantly lower in patients ($P \leq 0.05$) and concluded that these results suggest that increase oxidative stress present in patients with RA may lead to compensatory changes in the conc. of another antioxidants. These changes, in turn, may provide additional protection against lipid peroxidation in RA[17].

The pathogenesis of this disease is linked with the composition of free radicals at the places of inflammation[22]. Several studies reported a low antioxidant. Levels are a risk factors indicated that the inflammatory process produces ROS and decreased antioxidant levels, which may worsen the symptoms of the RA[16]

3. **Enzymatic antioxidants:** Table(1) showed a significant decrease ($P \leq 0.05$) in the activity of superoxide dismutase (SOD)and ceruloplasmin enzymes by 63% and 10% respectively, whereas the activity of glutathione peroxidase (GPx) enzyme showed a significant increase by 44% in the serum of patients with RA bycompared with the control. The results in table (2) also showed a significant decrease in the activity of SOD in female serum by 54% while in males by 51%, and the results showed a significant decrease in the activity of ceruloplasmin in males by 11% while in females by 10%, while showed the activity of GPx significantly increased in females by 46% while in males by 42% compared with the control group. The results of this study are identical to the findings of previous studies[18]. The decreased SOD activity in serum of patients with RA may be attributed to increase of free radical especialy that the superoxide (O_2^{*-}) and hydrogen peroxide (H_2O_2) inhibit the enzyme and reduce its activity. The enzyme decreased or increased according to the disease case, in this study, may indicate a degradation of these enzymatic antioxidants by free radicals during detoxification processes and it appears that increased level of (O_2^{*-})[23].

Conclusion

We conclude from this study that an imbalance in the balance system of oxidants, enzymatic and non-enzymatic antioxidants, had a significant impact on the deterioration of the condition of patients with RA. The RA caused oxidative stress.

The Concentration of Lead and Cadmium in the Gill and Muscle of Common Carp Fish (*Cyprinus carpio)* in Three Fish Farms in DhiQar City–South Iraq

Wesan Fadhel Khalef[1], Zainab Mohsen Ibrahim[2], Bushra Ali Ghyadh[2]

[1]Assistant Lecturer, [2]Lecturer Department of Biology, College of Science,Thi-Qar University, Iraq

Abstract

The present study was conducted to estimate the concentration of lead and cadmium element in gill and muscle of fish *Cyprinus carpio* in three fish farms derive their water from Garraf channel, a branch of the Tigris River in the province of DhiQar. The results of the present study that the concentration of trace elements (cadmium and lead) in the gills was higher than delimiters standard for joining the World Health where it is dangerous for human consumption, either in the muscles was lower concentration of them in the gills, we conclude from this study that fish consumption Farm at the present time does not cause marked damage but in the future cause a problem should be avoided.

Keywords: *Cyprinus carpio trace elements, fish farms.*

Introduction

The fish farming tributaries economic task in many countries of the world and taking this role is rising day after day, especially in recent years for several reasons articulated by the report issued by the bound food and agriculture and organization[1], which pointed out that most of the marine fisheries reached the stage saturation so that it cannot increase no matter how wild fish harvests increased fishing activity, and that fish stocks continues to decline due to an environmental fettle and overfishing, and the same source pointed out that aquaculture can contribute to the increase of fish products.

Aquaculture's success on a number of interrelated factors and may vary from the most important of those that specializes in environmental and water and the quality of water basins and of the most important environmental factors affecting fish farming, including pollutants that affect its presence on the suitability and appropriate environment and water for fish breeding and including trace minerals process[2]

The aim of the study: Due to the lack of an integrated study on fish farms and the extent of contamination of trace elements and what are the cause

Materials and Method

Description study area: Samples are taken the common carp (*Cyprinus carpio)* seasonally from winter 2018to the autumn of 2018, the number 9 fishs per season from careless stations ranged in length from 20-25 cm of the three fish farms in the province of DhiQar inches these farms manner drill and fill the docks using pumps diesel, the area of each farm almost one acre and derive their water from Garraf channel, a branch of the Tigris River.
