Minor Revision

Would you be willing to review a revision of this manuscript?

Yes

Confidential Comments to the Editor

Dear editors. I am very excited to review this manuscript. I appreciate the Editors (Prof/Dr) who have trusted me to comment in order to improve the quality of the manuscript. As proof of having done this work, I expect you to provide some kind of certificate. Of course this is very important for my academic career and reporting to the University.

Comments to the Author

The authors need to immediately revise the manuscript. Any form of constructive comments by reviewers is mandatory. Consider adding a few sentences in the Abstract section, regarding the contributions and weaknesses of the study. In addition, the reference section should not display too many journals and books from your area. This will be in the spotlight, so that the responsibility of the authors is questioned.

Details

All articles published in Economic Alternatives have undergone rigorous peer review, based on initial screening by the editors and refereeing by anonymous expert referees.

Peer review of the Economic Alternatives in general follows four-stage procedure.

The first stage begins with submitting your article to a journal. At this first stage, the journal editor will decide if it's suitable for the journal, asking questions such as:

- A) Has the author followed the journal's guidelines?
- B) Is this the right journal for this article?
- C) Will the journal's readers find it interesting and useful?

The editor might reject the article immediately, but otherwise it will move to the next stage, and into peer review.

Stage two: First round of peer review

The editor-in-chief finds and contacts between 2 and 5 researchers/academics who are experts in your field. It is important for authors to know that the reviewers are not from your country/university or institution. The main source of appropriate independent reviewers is the system ScholarOne. The reviewers will be asked to read your article, to asses it, and advise the editor-in-chief whether to publish your paper in that journal.

They would give an opinion whether:

- A) your work is original or new;
- B) your methodology is appropriate and described so that others could replicate what you've done;
- C) you've presented your results clearly and appropriately;
- D) your conclusions are reliable and significant;
- E) the work is of a high enough standard to be published in the journal.

You'll then be given feedback about your article, telling you if any changes need to be made before it can be published. Please note the final editorial decision on a paper and the choice of who to invite to review is always at the editor's discretion. If the paper does not maintain sufficiently high academic standards, it may be rejected at this point.

Stage three: Revise and resubmit

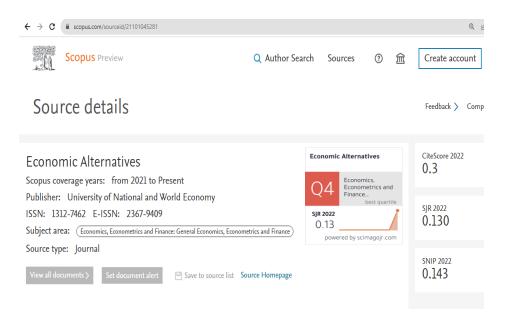

You can then amend your article based on the reviewers' comments, resubmitting it with any or all changes made.

If you decide you don't want to accept all the reviewers' comments, you can include a brief explanation of why you don't believe they are applicable with your resubmitted article. The editor can then make an assessment, and include your explanation when the amended article is sent back to the reviewers.

Stage four: Accepted

If the paper finally meets the editorial and reviewers standards it is accepted for publication. And that's it, you've made it through peer review.

Note: It might take 1-12 months between the acceptance and publication of the paper.

Introduction

The Covid-19 pandemic that ravaged Indonesia caused social constraints; there was a volatile health

Comment [i-[1]: Need to add more LR and with recent LR. Other aspect of this article is acceptable to me

and economic crises, with a drop in people's purchasing power, while communal income remained unchanged, if not declining (e.g. Oyinlola et al., 2021). Of course, this has a negative influence on the country's economy, particularly the inflation rate and exchange rate, which are employed as indicators in the Treynor-Mazuy model's conditional model calculation.

The Treynor Mazuy conditional model is used to test market timing ability and stock selection skill

using the same theoretical assumptions as the Treynor Mazuy unconditional model. Deb et al. (2007) discovered favorable but not significant selectivity results for stock mutual funds using the conditional method; this suggests that investment managers do poorly in stock selection when considering economic conditions in a country. Stock selection has a favorable and significant effect on stock mutual fund performance, according to research (Anita, 2013), but market timing ability has a negative effect on stock mutual fund performance.

Inflation's relative increase might be a decent indicator for capital market investors. When examined using the conditional model, the results of Anita's research (2013) reveal that inflation has a considerable negative effect on performing equities mutual funds. Mutual fund investors used inflation information on

average to make investment decisions; if inflation is high, the rate of return on mutual funds will increase; if inflation is low, the rate of return on mutual funds will decrease.

When the rupiah decreases in value, stock prices decrease as foreign investors exit the Indonesian stock market by selling shares. The net asset value (NAV) of mutual funds dropped because of declining investment and decreasing stock prices. If the rupiah exchange rate strengthens, the stock price will rise.

The rupiah exchange rate influences the performance of equities. In the stock market, mutual fund investors rely on information on changes in the rupiah exchange rate to make investment decisions; if the exchange rate changes are large, the mutual fund return rate will fall, and vice versa if the exchange rate changes are small.

We structure this article into five parts. Structure 1 highlights the background. It described the

literature review in structure 2. Structured 3, data and empirical methods as instruments in data interpretation. We describe the results and discussion of structure 4 and the last is the conclusion which occupies structure 5.

1. Literature review

Treynor-Mazuy is a research method that has not been widely used in Indonesia (for example Paramita and Sembiring, 2018; Naveed et al., 2020). This model applies to the possibility of risks and the expected rate of return, which varies depending on the economic conditions in each country. Because the conditional model, which considers inflation and exchange rate conditions, to have better capabilities than

the unconditional model, we expect it to outperform the unconditional model.

Market index movements and macroeconomic factors influenced the rate of return on a stock portfolio, such as inflation, interest rate changes, and economic growth. As a result, it must assess economic conditions, as well as their significance for the capital market (Elton et al., 2009), model Treynor-Mazuy conditional is:

$$Rp_{t} = \alpha_{0} + \alpha_{1} \cdot DP_{t-1} + \alpha_{2} \cdot T_{Bt-1} + \alpha_{3} \cdot FX_{t-1} + \beta_{0} \cdot Rm_{t} + \beta_{1} \cdot Rm_{t} \cdot DP_{t-1} + \beta_{2} Rm_{t} TB_{t-1} + \beta_{3} FX_{t-1} + \gamma Rm_{t}^{2} + \varepsilon p$$
(1)

Where: Rp = return portofolio reksa dana; Rm = return market pada periode t; DP= market dividen yield; TB= treasury bill interest rate; FX= yield on exchange rate fluctuation; and εp = random error.

Grinblatt and Titman (1995), Agarwal and Pradhan (2018), and Panda et al. (2015) derive the components in the Treynor Mazuy regression formula from the portfolio return minus the risk-free return for period t; the value of the reduction is the same as the alpha component added the first beta, which is multiplied by market return after deducting the risk-free return, then the second beta multiplied by macroeconomic elements multiplied by the alpha component. If there is over one macroeconomic element, repeat the computation using market return minus risk-free return, then add gamma multiplied by market return minus the squared risk-free return.

The macroeconomic values put in the regression model will influence the value of the alpha, beta, and gamma coefficients got by the conditional formula (Issah and Antwi, 2017). Managers will evaluate the macroeconomic conditions of a country when deciding on investment management measures in the conditional model (Koju et al., 2020). If a manager is attentive in predicting the economic state of his country and its expectations, his abilities will cause the positive value of an organization he manages (Carnevale and Hatak, 2020).

Inflation is one of the economic indicators marked by an increase in the price of needs in the market, hence this condition can describe a reduction in people's purchasing power because of rising prices in the conditional model. The rise in people's income does not keep pace with their needs. When inflation rises, Bank Indonesia will raise the SBI interest rate to keep inflation from bay and encourage investors to keep investing in the stock market. The exchange rate is the value of one currency in relation to other currencies. A status of a country's economy can be reflected in currency exchange rates. The stability of a

growing exchange rate shows that the country in question is in reasonably excellent economic shape (Salvatore, 1997).

Changes in a country's exchange rate affect general economic conditions, primarily people's purchasing power, that are affected by changes in the consumer price index. According to Taylor (1995), the exchange rate's significance has grown significantly in recent years, mainly since the establishment of the Euro currency and the financial crisis. The movement of capital flows is better described by changes in exchange rates and stock prices. The major result of the portfolio method is a decrease in stock prices, which generates a decrease in the wealth of domestic investors, who are the drivers of money demand, and this can cause a decline in interest rates.

2. Data and empirical methods

There are 273 equity mutual funds in the population. Researchers chose this time period because Indonesia had an economic crisis precipitated by the Covid-19 outbreak in the 2020s, making it a good research reference point.

There were 58 mutual funds that met the sample requirements of having assets under management of over 500 billion rupiah, and there were three stock mutual funds whose data availability was incomplete throughout the research period, thus we gained 55 stock mutual fund samples. Because the enormous number of managed funds shows high public trust in mutual fund businesses, the examination is limited

to mutual funds with AUM above 500 billion rupiah.

NAV data from each mutual fund sample during the observation period, BI rate information, JCI data, inflation data, and the rupiah exchange rate during the observation period are among the data collected. The STATA16 computer application is used to process the data that has been got (see Table 1).

3. Results and discussion

Table 2 shows a minimum value of -6.934006 originating from Mandiri Dynamic Equity mutual

funds with investment manager PT. Mandiri Manajemen Investasi, and a maximum value of 23,25468 originating from Pan Arcadia Dana Saham Growing with investment management PT. Pan Arcadia Capital. The mean value got is -2.256315, with a standard deviation of 5.574203, showing a data spread of 55.74 percent on the independent variable market timing ability conditional model. Compared to other companies, the market timing ability conditional model data fluctuation in each observed firm was substantially higher and showed the highest level of variability.

The Pan Arcadia Mutual Fund, the Growing Stock Fund, with PT. Pan Arcadia Capital as investment manager, has a minimum value of -0.0584528, while the Sam Indonesian Equity Fund, with PT. Samuel Asset Management as investment manager, has a maximum value of 0.1068816.

The average result is 0.005566. The standard deviation of 0.0199809 shows the level of distribution of the independent variable data from the stock selection skill conditional model of 1.20 percent. In the results of the Kolmogorov-Smirnov normality test show the residual probability level of 0.306 > 0.05, these results show the data was normally distributed. From the Table 4 and Table 5 shows that the results of the multicollinearity test show the VIF value exceeds 10, meaning that it is free of multicollinearity.

The ARCH test shows the probability value of Lag-residual of 0.970, which is more than the coefficient value of 0.05, then heteroscedasticity does not occur in the research data (see Table 6). The results of the autocorrelation test using the Lagrange Multiplier Test (LM test) show that the value of lag-residual is above the significance value of 0.05, shows that the data is free of autocorrelation. From the Table 7, we can explain it:

Sharpe ratio = 0.143 + 0.012 MTA conditional + 1.117 SSS conditional (2)

Where: T-table (2.004879), and F-table (3.168246). The Sharpe ratio shows that the market timing ability conditional model variable has a considerable positive effect on performing stock mutual funds. These findings show that inflation and exchange rates have a major impact on market timing management by assessing an investment manager's ability to decide about when to sell and buy stocks in order to improve the performance of an equity mutual fund portfolio. In the Covid-19 situation that occurred in Indonesia, the market timing ability conditional model of the investment manager shows a positive direction, showing that the manager's ability to manage the portfolio considered in increasing the rate of return of his portfolio with the conditional model of inflation and exchange rates.

This study's findings are consistent with Deb et al., (2007), Anita, (2013), Mustofa and Kusumawardhani (2016), and Maulana and Ardiansari (2017), all of whom found conditional market timing to be favorable and significant in improving the performance of equity mutual fund portfolios.

During the pandemic in Indonesia, fluctuations in the value of inflation and the rupiah exchange rate had a positive and significant impact on the selection of stock mutual funds, where investment managers were careful in choosing the stocks they managed, but economic conditions were unpredictable.

According to the Treynor-Mazuy Conditional model's recapitulation, which shown in table 4, there are 5 equity mutual funds in Indonesia, or 9.09 percent, with positive or market timing capabilities, while

the remaining 90.91 percent do not. The gamma variable's coefficient is positive, showing that the investment manager's ability to market time is predicted to lead to higher stock mutual fund returns. When making investment selections, investment managers should take inflation and the rupiah currency

rate into account. If inflation rises, which is followed by an increase in firm costs and a decrease in profitability, mutual fund demand will decrease.

Stock selection skill is a conditional model variable that has a positive and large impact on stock mutual fund performance. It described the capacity of stock selection conditional models of investment managers to increase mutual fund performance in this paper, which describes the activities of investment managers in their ability to choose stocks. The mutual fund's performance improves as the investment manager's stock selection competence improves. In the presence of macroeconomic variables as control variables in the Treynor-Mansuy, which allows investment managers to improve the performance of stock mutual fund portfolios through stock picking abilities.

According to the Treynor-Mazuy conditional model's recapitulation had shown in Table 8, 45 equity mutual funds (81.18 percent) have positive or have stock selectivity capabilities. Another 18.82 percent cannot choose their own stocks. The findings of this study are comparable to those of Paramita et al., (2017), who found that mutual fund investment managers' stock selection skills and market timing abilities are stronger in times of crisis than in periods of stability. This is because, during a crisis, investment managers are more cautious in their decisions.

The alpha variable's coefficient is positive, showing that the investment manager's stock selection

ability contributes to a decrease in stock mutual fund returns. When the rupiah weakens, stock prices fall as foreign investors sell their shares and exit the Indonesian capital market, resulting in a decline in stock prices, which leads mutual fund NAVs to decrease, and vice versa.

Conclusion

Interestingly, the conditional model of investment managers requires inflation and exchange rates into consideration while making management decisions, resulting in positive and significant results. The results show an exorbitant amount of positive numbers, as well as 5 equity funds is 9.09 percent having market timing ability. In the conditional model shows that stock selection skills have a positive and significant coefficient value on stock mutual fund performance. The number of investment managers with the ability to choose stocks was determined to be 81.18 percent in the conditional model during the epidemic that sparked the crisis.

Only one stock mutual fund, the Sam Indonesia Equity Fund mutual fund from the investment manager of PT. Samuel Asset Management, was found to have both market timing and positive stock selection capabilities when the conditional model was calculated. According to Sharpe's estimate, the Sam Indonesia Equity Fund mutual fund has a good timing capability of 10,8225 and a stock selection capability of 0.1069, resulting in outstanding performance. The public's faith in this investment manager is similarly high, with assets under management (AUM) exceeding 1 trillion rupiah throughout the research period. Based on the conditional model, 1.82 percent of funds are invested.

The Treynor-Mazuy Conditional Model: Overview of Market Timing and Stock Selection on Equity Mutual Funds Performance

Abstract

This study explores market timing and stock selection by investment managers during the Covid-19 in Indonesia. By applying several sample criteria to the population of mutual funds registered at OJK, we found 55 stock mutual funds using the purposive sampling. We processed data using the STATA16 computer program. The Treynor-Mazuy conditional inflation and exchange rate model, according to the findings of this study, can show that market timing and stock selection for mutual fund managers have a positive and significant impact on improving the performance of equity fund portfolios during the pandemic in Indonesia. In Indonesia, there are 5 equities mutual funds having positive or market timing skills, accounting for 9.09 percent of all equity mutual funds, whereas the remaining 90.91 percent do not. The positive coefficient of the gamma variable shows that the investment manager's ability to market time expected to result in higher stock mutual fund returns. Positive or stock selectivity characteristics are available in 45 equity mutual funds, or 81.18 percent. The contribution of this study focuses on exchange rate and inflation. However, there needs to be a relevant follow-up comparison before the pandemic occurs. In addition, it is necessary to consider other elements in the macro-economy.

Comment [i-[3]: The authors need to immediately revise the manuscript. Any form of constructive comments by reviewers is mandatory. Consider adding a few sentences in the Abstract section, regarding the contributions and weaknesses of the study.

51 52

Variabel	Operational Definition	Measuremet
Mutual fund performance	Indicators for assessing a mutual fund	Sharpe ratio
Market timing ability	Ability to read and forecast market situation	Treynor-Mazui model: $Rp - Rf = \alpha + \beta_1 (Rm - Rf) + \beta_2$ (inflation) $(Rm - Rf) + \beta_3$ (exchange rate) $(Rm - Rf) + \gamma (Rm - Rf)^2 + \varepsilon p$
Stock selection skill	Ability to determine the selected stock	Treynor-Mazui model: $Rp - Rf = \alpha$ - $\beta_1(Rm-Rf) + \beta_2(inflaton) (Rm-Rf)$ $+ \beta_3(exchange rate) (Rm-Rf) + \gamma$ $(Rm-Rf)^2 + \varepsilon p$
Inflation	Inflation is measured by recording the inflation rate of the national consumer price index published by BI during the study period	Inflation = $\frac{HKn - HKn - 1}{HKn - 1} \times 100\%$
Exchange rate	The exchange rate is measured using the middle rate of the US dollar against the rupiah during the study period	$ER \text{ ratio} = \frac{ERt - ERt - 1}{ERt - 1}$
